CLAUDEL, PAUL (1868-). A French poet and dramatist, born in Champagne at Villeneuve-sur-Fère, and educated in Paris. He frequented the Symbolist circles, attending Mallarmé's famous Tuesdays. Later, he entered the French consular service and was sent successively to China, the United States, Germany, and Italy. During the War he was transferred to the diplomatic service, obtaining the post of minister to Brazil and afterwards minister to Copenhagen. In 1922, he was ambassador to Japan. He became after his conversion at 20, a poet of mysticism, and broke with the French classical tradition of analytic clarity. He excelled in giving an impression of ensembles and took no care for details. He had a literary

vogue both before and after the War, when his *Tidings Brought to Mary* was played on the Parisian stage. Claudel's works include: *Agamemnon*, trans. (1906); *La Connaissance de l'Est* (1900); *L'arbre* (1900-01); *L'otage*; *Cette Heure qui est entre le printemps et l'été*; *Art poétique*; *L'Echange*; *Le Partage de Midi*; *La Tête d'or*; *Le Repos du septième jour*; *La jeune fille Violaine*; *La Ville*; *La Connaissance du monde*; *Cinq grandes Odes*; *Le Pain dur*; *Le Père humilité*; *La Nuit de Noël* (1914); *Corona bénigatitidis*; *Vers l'Exil*; *L'annonce faite à Marie*; *Poèmes d'été*; *Poèmes de guerre*; *L'Ours et la lune*; *Feuilles de Saints*; *Les Euménides d'Eschylle*.

CLAXTON, PHILANDER PRIESTLEY (1862-). An American educator (see VOL. V). He resigned as United States Commissioner of Education in 1921, becoming provost of the University of Alabama. He is also known as a member of the League for the Enforcement of Peace and of other peace societies.

CLAYTON, HENRY DE LAMAR (1857-). An American jurist. He was born in Barbour County, Ala., and graduated from the University of Alabama in 1877, and from the law department of the university in 1878. He practiced law in several towns in Alabama from 1878 to 1914, and during that period also served as register in chancery of Barbour County, and as a member of the Alabama General Assembly (1890-1891). From 1893 to 1896, he was United States District Attorney, and in 1897 was elected to the 55th Congress; he served until May, 1914, when he was appointed district judge for the Middle and Northern Districts of Alabama. While in Congress, he was the author of the Clayton Act for the regulation of railways. In 1908, he served as permanent chairman at the Democratic National Convention.

CLAYTON ANTI-TRUST ACT. See TRUSTS; UNITED STATES, *History*.

CLEARING HOUSES. See FINANCE AND BANKING.

CLEARWATER, ALPHONSO TRUMPOUR (1848-). An American jurist. He was born at West Point, N. Y., and was educated in the public and private schools. In 1871, he was admitted to the bar and was elected District Attorney of Ulster County in 1877, being reelected several times. He was appointed justice of the Supreme Court to succeed Alton B. Parker, and was then chosen chief judge of the Court of Appeals. He held many important positions both in legal and civil life, and was many times a delegate to national, State and other conventions. He is the author of numerous papers and addresses on historical, patriotic and biographical subjects, and served on many important legal commissions.

CLEMEN, OTTO CONSTANTIN (1871-). A German theological historian born in Grimma. He studied theology and history, specializing on the Reformation. His principal works are: *Johann Pupper von Goch* (1896); *Georg Helts, Briefwechsel* (1907); *Alexian Chrosner* (1908); *Studien zu Melanchthons Reden und Gedichten* (1913); *Alte Einblattdrucke* (1911); *Beiträge zu deutschen Kulturgeschichte aus Mitau, Riga und Reval* (1919). Clemén is the editor of many pamphlets on the Reformation and the works of Luther.

CLEMEN, PAUL (1866-). A German writer born at Sommerfeld. He studied philos-

ophy and history, and later became professor of art history at Bonn and director of the art galleries of the Rhine provinces. In 1907-08 he was exchange professor at Harvard. He has written among other works: *Die Portraitdarstellung Karls des Grossen* (1889); *Der karolingische Kaiserpalast zu Ingelheim* (1890); *Merovinger und Karolinger Plastik* (1892); *Die Kunstdenkmäler der Rheinprovinzen* (1892); *Ruskin* (1900); *Die romanische Monumentalmalerei in den Rheinlanden* (1910); *Denkmalpflege in Frankreich* (1918); *Kunstschutz im Kriege* (1919); and *Belgische Kunstdenkmäler* (1921).

CLÉMENTEAU, GEORGES EUGÈNE BENJAMIN (1841-). A French statesman (see VOL. V). He had written and spoken about the possibility of war long before the War began, urging the realization of the artillery programme, and in September, 1914, his paper, *L'Homme Libre*, was suppressed on account of its violent criticism of the army medical services. Two days after its suppression, however, he issued *L'Homme Enchaîné*, in which, in spite of the censorship, he managed to fight the policy of the government. He fought also in the Senate. On the outbreak of war, he was president of the Foreign Affairs Committee. Later he became president of the Army Committee of the Upper Chamber. His policy was directly opposed to M. Caillaux's (q.v.), as he advocated fighting to the finish. On Nov. 16, 1917, he succeeded M. Briand as prime minister, and formed his "Victory cabinet," thus defeating the efforts of M. Caillaux. While he was in power during the War his policy was drastic, in regard both to the conduct of the War and to food restrictions. This policy was accepted without opposition as long as the War lasted, but after the Armistice his countrymen showed less confidence in him as a leader in peace-time. Attempts were made to drive him from office before the peace negotiations, but he remained in power until after the Peace Treaty was signed. He presided over the Peace Conference, as France's chief delegate. On Feb. 19, 1919, he was fired upon and wounded by a young anarchist, Emile Cottin. He was proposed as candidate of his party for the presidency in 1920, but withdrew his name when he saw that he stood little chance of success against M. Deschanel. He then retired from politics. He became a member of the French Academy in 1918, and was given the doctor's degree at Oxford in 1921. In 1922, he visited the United States unofficially, and was enthusiastically acclaimed.

CLEMENT, ERNEST WILSON (1860-). An American teacher in Japan and writer on Japanese subjects (see VOL. V). He was vice president of the Asiatic Society of Japan from 1916 to 1921. In 1920, he resigned as special correspondent of the *Chicago Daily News*. His recent works include: *A Short History of Japan* (1915) and *Constitutional Imperialism in Japan* (1916).

CLEVELAND. The fifth city in the United States. The population rose from 569,342 in 1910 to 796,841 in 1920 and to 912,502 by estimate of the Bureau of the Census in 1924. The area of the city increased from 51.83 square miles in 1914 to 68.9 in 1924. By charter amendment voted in November, 1921, and put in effect at the beginning of 1924, Cleveland became the largest city in the country

governed by the city manager-council plan. The council consisted of 25 members elected from one of four districts under a system of proportional representation. A number of municipal improvements were completed during the 10 years between 1914 and 1924. The double-deck Detroit-Superior viaduct, which was 3112 feet long and cost \$5,407,000, was dedicated in 1918. Clark Avenue viaduct, 6687 feet long, was built in 1917 at a cost of \$1,398,000, and the Brooklyn-Brighton concrete bridge of 18 arches costing \$571,057 was finished in 1916. The hospital, costing \$5,337,486 with the land, and holding 1200 beds, was nearing completion in July, 1924; other units comprised the nurses' home, the nurses' training school, affiliated with Western Reserve University (q.v.) the contagious ward, the tuberculosis ward, and the psychopathic ward. In 1922, the Public Hall, a unit of the group plan costing about \$6,500,000, was dedicated. It seated 12,000 persons and contained a \$100,000 five-manual organ of 10,010 pipes. It was voted in 1919 to allow the Cleveland Union Depot and Terminal, which, by the group plan was to have been built at the foot of the Mall, to be built on the Public Square. It was expected to cost \$75,000,000. The Van Sweringen merger of four railroads with total balance-sheet footings of \$1,500,000,000 was to be brought under a unified control with Cleveland as headquarters in the fall of 1924.

The Cleveland division of water increased its capital investment from \$14,870,666 in 1914 to \$43,293,164 in 1924. The Division Street pumping station, fed by a tunnel 10 feet in diameter, and the filtration plant, with a capacity of 150,000,000 gallons daily, were first operated fully in 1918. These units cost \$6,653,946. The Baldwin filtration plant, under construction in 1924, was estimated to cost \$20,000,000. Its reservoir, with a storage capacity of 130,000,000 gallons, was the largest covered reservoir in the world. Two sewage-disposal plants also were completed in 1922, and a bond issue of \$3,000,000 was authorized and contracts awarded for a third. The capital investment of the municipal electric light plant rose from \$3,021,135 in 1914 to \$8,000,000 in 1924. In 1914, the miles of track operated by the Cleveland Railway Company was 344.76 and the number of passengers carried 231,063,734; by 1923, this had risen to 425.7 miles of track and 417,405,905 passengers.

A city plan commission was named in 1916 by the mayor. By ordinance the commission was given power to supervise and control the design and location of public buildings, harbors and bridges, and the location, extension and platting of streets, parks, and other public places. In 1923, a seven-block extension of Carnegie Avenue was completed, and in 1924 property was being acquired for the widening of the same avenue from East 22d Street to East 55th Street, and construction was expected to be completed in 1925. Plans were also under way to widen and extend Chester Avenue from East 21st Street to East 40th Street, and widen St. Clair Avenue. County bonds to the amount of \$5,000,000 were authorized for the construction of the Lorain high-level bridge. An art museum was built in 1916, and a museum of natural history was founded four years later. Another unit, the new Public Library, costing \$4,500,000, was nearing completion in

1924. This will be the centre of a library system including 26 neighborhood branches and 29 school branches.

After reorganization of the school system in 1917, four new junior high schools, seven elementary schools, and several annexes were built. The school board also took over the supervision of a school for girls over 16 years of age which had been started in a local factory to combine cultural and trade instruction. This became the first trade school of the city. The council on educational institutions was formed of representatives of the institutions of higher education, the art and natural history museums, the libraries, and similar organizations. The union of several great educational institutions, including Western Reserve University and Case School of Applied Science (q.v.) was being worked out in 1924. The Cleveland Foundation, and the Welfare Federation of all the charitable organizations in the city, were organized.

CLEVELAND, FREDERICK ALBERT (1865-). An American economist, born at Sterling, Ill., and educated at DePauw University and at the universities of Chicago and Pennsylvania. From 1900-03, he taught finance in Philadelphia and New York City. Thereafter he served on many boards and commissions dealing with economics, and notably, since 1907, on the bureaus of municipal research in New York and Philadelphia. His works include: *The Growth of Democracy in the United States* (1898); *Funds and their Uses* (1902); *The Bank and the Treasury* (1905); *Chapters in Municipal Administration and Accounting* (1909); *Railroad Promotion and Capitalization* (1912); *A Handbook of Municipal Accounting* (1913); and *Organized Democracy* (1913). He also collaborated on the following works: *Railroad Finance* (with F. W. Powell, 1913); *Democracy in Reconstruction* (with Joseph Schafer, 1919); *The Budget and Responsible Government* (with A. E. Buck, 1920); *National Expenditures and Public Economy* (addresses and papers; with S. M. Lindsay, 1921); *Funds and their Uses* (1922).

CLEVINGER, GALEN HOWELL (1877-). An American metallurgist, born at Pike, N. Y. He was graduated at the South Dakota School of Mines in 1901. During 1901-05 he served professionally as a chemist and metallurgist to various mining companies, and then spent a year as instructor in metallurgy at Stanford, where after three years in consulting practice, he returned and held professorial relations with that university until 1918, when he again resumed his consulting practice. During the War he was chairman of the section on metallurgy of the National Research Council, and later became vice-chairman of the Division of Engineering on the Council. He has invented various processes for the treatment of ores and is an accepted authority on gold extraction and on manganese-silver ores, as well as on electric smelting.

CLIFFORD, SIR HUGH (CHARLES) (1866-). A British colonial administrator (see VOL. V). In 1914, as governor of the Gold Coast, he drew up, with the French Colonial authorities, an agreement for the provisional administration of Togoland. He was in charge of the administration of the British Sphere of Occupation in Togoland during and immediately after the War, and governor of the Gold

Coast until 1919, when he became governor and commander-in-chief of Nigeria. He was created Knight of the Grand Cross of St. Michael and St. George in 1921. His works during this period include: *The Further Side of Silence* (1916); *The German Colonies* (1918); and *The Gold Coast Regiment in the East African Campaign* (1920).

CLIFFORD, LUCY JANE (Mrs. William Kingdon C.). An English author (see Vol. V). She wrote the novels: *The House in Marylebone* (1917); *Mr. Webster and Others* (1918); *Miss Fingal* (1919); and the plays: *A Woman Alone* (1915), and *Tico's Company* (3 acts, 1915).

CLIMATE. See METEOROLOGY; GEOLOGY.

CLOCK MOTOR. See ELECTRIC MOTORS IN INDUSTRY.

CLYNES, JOHN ROBERT (1869-). British labor leader, born at Oldham, Lancashire, England. As a child he worked in a cotton mill. He became a trade union organizer, and later was elected president of the National Union of General Workers. In 1906, he entered Parliament and in 1921 was made chairman of the Parliamentary Labor party. During the War he was Food Controller (1918-19). He was a moderate of the trade union side of the British Labor movement, and in 1924 was made Lord Privy Seal of Ramsay MacDonald's Labor cabinet.

COAL. The coal industry throughout the world underwent many significant changes because of the War and resultant political and economic conditions. As a prime essential to modern industry coal was naturally important in the War; it was required on an extraordinary scale for the production of munitions. Some of the combatant nations were cut off from their ordinary sources of commercial supply and did not contain this essential within their boundaries.

In this period, the United States, which previously had become preëminent as a producer of coal, maintained its lead and increased its output. In Great Britain no notable increase was effected in production; labor and economic conditions rather restricted production. In France, destruction of the mines by the Germans resulted in a shortage which was in no way met by the amount of coal actually turned over under the terms of the Armistice. Germany's loss of the mines of Alsace and Silesia, and temporarily of those in the Saar Basin and the Palatinate, naturally cut down production; in 1913 Germany exported more coal than it imported, but in 1922 the imports were in excess of the exports.

000,000 metric tons, or approximately 38.5 per cent of the world's total. By 1916 this output had increased to 42.7 per cent, and in the following year, when the United States had entered the War, to 44.6 per cent, while in 1918, when the United States was making its maximum effort, it amounted to 46.4 per cent. In 1900 the coal production of the United States was but 270,000,000 short tons; in 1917 it amounted to over 650,000,000 short tons. Naturally the War led to increased exports of coal from the United States, a traffic which, though hazardous, was extremely profitable and in volume amounted to 20 per cent more in 1917 than in 1913.

When the United States entered the War, the industry was organized under government supervision to secure a maximum output and to stabilize prices. The coal committee of the National Council of Defense fixed a price in 1917; this was later repudiated by its chairman, Secretary of War Baker. After further consideration of the matter, on Aug. 21, 1917, President Wilson fixed a base price for coal, and on August 26, Dr. Harry A. Garfield was appointed fuel administrator. His work was done under many difficulties that year. Transportation facilities were inadequate, and it was a cold and heavy winter which began early. Some mines were shut down, and toward the end of the year there was a coal famine in the Middle West and in the East. Miners' wages were raised, and every effort was made to speed up both production and transportation of fuel, so that conditions gradually improved. Notwithstanding a decline in the number of miners through military service, coal production picked up in 1918 and more than enough to meet the needs of the country was produced.

The soft coal region was the scene of a serious strike in 1919, when the miners demanded the permanent continuance of war-time wages; it was officially terminated December 10. The industry became increasingly efficient in 1920, with the aim of making good the shortages caused by the strike of the previous year; this was achieved in the face of a railway strike and failure to allot and handle railway cars properly. In the following year, 1921, the coal industry shared in the general depression; production of anthracite increased, but bituminous coal fell to its lowest point since 1913. In 1922, conditions were still worse, with serious strikes in both the anthracite and bituminous fields. Anthracite production fell from 90,473,451 short tons to 54,683,022 short tons, a decrease of 35,550,429 short tons; this of course was due to the strike, which lasted from April 1 to September 11, 164 days, or one day less than the previous most serious strike, that of 1902. The production of bituminous coal, in 1922, was 407,894,000 short tons, as compared with 415,921,000 short tons in 1921, and 563,490,845 in 1920. In this year, however, through improved industrial conditions, the consumption of bituminous coal was approximately 400,000,000 short tons against 392,000,000 short tons in 1921.

During this period there was increased cost of coal, and this resulted both in greater conservation and improved furnace equipment and operation, as well as the substitution of other fuels, such as crude oil, which could be operated more efficiently. The bituminous strike in 1922 paralyzed the union coal fields, but on the other

WORLD'S PRODUCTION OF COAL
(In Metric Tons)

	Production in part (Estimated)	Per cent Produced by United States
1913	1,341,000,000	38.5
1914	1,208,000,000	38.5
1915	1,190,000,000	40.5
1916	1,257,000,000	42.7
1917	1,325,000,000	44.6
1918	1,332,000,000	46.4
1919	1,168,000,000	43.1
1920	1,319,000,000	45.3
1921	1,136,000,000	40.4
1922	1,208,000,000	34.6

Production in the United States. In 1913, the production of the United States was 1,341,-

hand, the non-union fields were able to produce as much as 5,000,000 tons a week, which could have been increased to possibly 6,000,000, or even 7,500,000 tons in case of a national emergency. Various attempts were made to end this strike, and conferences were called by the President of the United States, but without result. It was finally concluded with a victory for the United Mine Workers of America which forced the continuance all winter of the war-time wages. These strikes were accompanied by the usual amount of disorder, but a notable event occurred on June 22, 1922, when a mob stormed a non-union mine at Herrin, in Williamson County, Ill., capturing 48 and shooting and cutting 21 of them to death in a most brutal manner. This mine was a strip mine, six miles south of Herrin in Williamson County, which was said to have broken an agreement with the union, and attempted to operate with non-union labor under an armed guard.

In 1922 an Act of Congress provided for a coal commission which made an exhaustive study of the conditions attending the production and marketing of coal in the United States and made a series of recommendations for the better conduct of the industry in the preliminary report submitted on July 8, 1923. It was apparent that the American coal industry was being conducted under unusual conditions due to the conflict between capital and labor, as represented by the United Mine Workers of America, an efficient organization which had been successful in the strikes and negotiations it had undertaken. At the same time the consuming public suffered, even in this adjustment, as with increased wages the cost of coal was raised to the consumer.

ANNUAL COAL PRODUCTION OF THE UNITED STATES (Net tons)			
	Anthracite	Bituminous	Total
1913	91,535,000	478,435,000	569,960,000
1914	90,821,000	422,704,000	513,525,000
1915	88,895,000	422,624,000	511,619,000
1916	87,578,000	502,282,000	589,860,000
1917	99,612,000	551,790,000	651,402,000
1918	98,826,000	579,386,000	678,212,000
1919	88,100,000	465,860,000	553,960,000
1920	89,598,249	563,490,845	653,089,094
1921	90,473,451	515,921,950	606,395,401
1922	54,683,022	407,894,000	462,577,022

Mine Fatalities. The mining of coal continued as a hazardous occupation in the United States, but an encouraging decrease in the number of fatalities was recorded. In 1922 there were 1971 fatal accidents in the United States coal mines, which represented a reduction of 16 from the previous year. There were 13 accidents in each of which five or more men were killed, with a total loss of 272 lives. In 1921 only five similar accidents occurred, in which 34 men were killed. The following statistics from the United States Bureau of Mines indicates the decreased number of accidents in this field.

FATALITIES AT COAL MINES					
1917	1918	1919	1920	1921	1922
2,696	2,580	2,317	2,271	1,987	1,971

British Coal Industry. The outbreak of the War in Europe brought many problems to the British coal industry in the way of securing an adequate output and maintaining satisfactory conditions of labor and employment. In the fall of 1916 the British Board of Trade announced that it would take over the coal mines

for the period of the War and establish a new department of control for the industry. Later, matters connected with distribution, wages, production, and price of coal were concentrated in the Mines Control Department, which was established for this purpose. In order to relieve the traffic on the railways increased transport of coal by canal was provided for, and later Great Britain was divided into fuel districts to provide for inland distribution with a minimum of transportation.

In 1913 Great Britain had produced some 287,500,000 long tons of coal, and of this it had exported some 97,700,000 long tons, divided as follows: coal, 73,400,000 tons; coke and briquettes, 3,300,000; bunkers, 21,000,000; leaving available for home consumption 189,800,000 tons. During the War the production had fallen in amount, so that by 1918 the output was 226,000,000, of which 35,000,000 tons were exported as cargo and 25,000,000 tons as bunkers, while by 1921 there was a serious decline, with an output of but 163,000,000 tons, of which 37,200,000 were exported, leaving but 129,200,000 available for home consumption and requiring imports of 3,400,000 tons.

At the end of March, 1921, the policy of department control was ended in Great Britain, and the industry was restored to private ownership. This involved the reduction of wages and the abandonment of state subsidies. Already a point had been reached where, with the highest wages on record, there had resulted the lowest average output per miner ever recorded. Unemployment and strikes now developed in the industry, and readjustment was imperative; this, by the following year, was more or less satisfactorily accomplished. British wages this year decreased 46 per cent in the leading coal fields, and while coal was exported it was at prices that did not permit of profit. In the following year, 1922, however, the industry was restored to a more normal basis, producing 255,891,786 metric tons; and in 1923 this was increased to over 260,000,000 tons.

French Coal Industry. The systematic and complete destruction of the coal mines of France by the Germans in their ruthless invasion developed a condition not altogether compensated by the return of Alsace-Lorraine with its mines after the Armistice. The mines in northeastern France, especially those around Lens, which contributed a large part of the French coal production, were so completely destroyed, that by the year after the Armistice, France was facing an annual shortage of 20,000,000 tons, which was almost half of the total normal production. Nevertheless the French miners set to work assiduously to repair the damage and put their mines on a production basis, so that they were able to approach the 41,000,000 tons marking their pre-war requirements. The production of coal in France during the 10 years, 1913-23, follows:

PRODUCTION OF COAL IN FRANCE (Metric Tons)	
1913	40,844,218
1914	26,568,258
1915	19,523,863
1916	21,310,000
1917	28,891,728
1918	25,000,000
1919	22,476,786
1920	25,274,304
1921	28,940,473
1922	31,940,845

German Coal Industry. The unsuccessful outcome of the War was indeed serious for Germany so far as the coal industry was concerned in its bearing on manufacturing. In 1913 the German coal production was in excess of 190,000,000 metric tons of bituminous coal and 87,000,000 tons of lignite, in addition to coke and briquettes, as specified in the accompanying table. Of this amount Germany was able to export 34,598,408 tons, or an excess of 24,038,339 tons over domestic consumption. Naturally, during the War the exports of Germany were confined to adjacent neutral countries; after the Armistice, Germany was stripped permanently of coal lands which had been considered invaluable to its industry.

In 1922 the German inland requirements of bituminous coal were estimated at 150,000,000 tons, and for this, as will appear in the accompanying table, approximately 130,000,000 tons were available. The loss of coal production capacity in Germany was due first to the fact that rich coal areas in Upper Silesia, which in 1913 had produced 32,500,000 tons of coal, or 17 per cent of the entire product of the nation, were allocated to Poland, while Alsace-Lorraine, which in 1913 had produced 4,790,000 tons, was returned to France. In addition Germany lost the Saar Basin and the Palatinate for 15 years, at the end of which a plebiscite was to be taken to determine the sovereignty of these areas, which, in 1913, produced 12,223,000 tons of coal; in 1920, 9,410,433 tons, and in 1921, 9,574,602 tons. Furthermore, the German coal industry was restricted by reduced hours of labor, which were materially decreased from those prevailing before the War, while labor itself was marked by less efficiency.

PRODUCTION OF COAL AND FUEL IN
THE GERMAN EMPIRE
(Metric Tons)

	1913	1922
Bituminous	190,109,440	129,964,597
Lignite	87,283,084	137,207,125
Coke	34,630,391	29,661,291
Bituminous briquettes ..	6,992,499	5,562,811
Lignite briquettes . . .	21,498,397	29,466,149

Belgian Coal Industry. In Belgium the coal mines were not damaged as were those in France, as the intentions of the Germans had not been to destroy them utterly but merely to render them temporarily incapable of operating, when they were not taken over immediately by the Germans themselves. Consequently all that was required was new machinery, and in 1920 an output of 22,388,700 metric tons was secured, which showed a slight diminution in the following years. At the same time, this was in excess of domestic requirements, which in 1921 amounted to about 17,000,000 tons, so that coal was available for export. This condition would not prevail with Belgian industry working on a pre-war basis, and imports of fuel probably would be necessary.

COATES, ALBERT (1882-). A British orchestral conductor, born (of an English fa-

ther and a Russian mother) at Petrograd. Although he had studied piano with an older brother, he did not decide on a musical career until he was 20. He then entered the Leipzig Conservatory, where his teachers were Teichmüller (piano), Klengel (cello) and Nikisch (conducting). He made his début as conductor with Offenbach's *Contes d'Hoffmann* in Leipzig. Upon the recommendation of Nikisch he was appointed principal conductor of the Elberfeld opera in 1906. After a short time as Schuch's assistant in Dresden he went to Mannheim as coördinate conductor with Bodanzky. Here the director of the Imperial Opera at Petrograd heard him and engaged him in 1911 for that institution, where Coates remained through the horrors of the revolution until 1919. In 1914 he made his first appearance in London, alternating with Bodanzky in the first performances of *Parsifal* in England. In 1919, he returned as conductor for Beecham's operatic company, directing also some concerts of the London Philharmonic Society and of the Symphony Orchestra. On Dec. 30, 1920, he made his American début with the New York Symphony Orchestra with emphatic success, and for two seasons he alternated with Damrosch. During the summer of 1923, he conducted a season of Russian opera at Barcelona, and in 1924, was the guest conductor of the Rochester Symphony Orchestra for the second half of the season. He is the composer of an opera, *Sardanapalus* (Petrograd, 1916), and of some orchestral works in smaller form.

COBB, FRANK IRVING (1869-1923). An American editor and writer, born in Shawnee County, Kan. He was educated in the public schools and at the Michigan State Normal School, beginning newspaper work for the Grand Rapids *Herald* when he was 21 years old. By reporting three national conventions and covering several sessions of the Michigan Legislature, he gained a wide acquaintance with political leaders and thus received an adequate preparation for his future work. Before being invited to New York by Joseph Pulitzer, he had been chief editorial writer on the Detroit *Free Press* (1900-04), having just previous to that been on the Detroit *Evening News*. Mr. Cobb directed the editorial page of the New York *World* for 20 years (1904-24), and became recognized as perhaps the strongest writer on the New York press since Horace Greeley. He has been described as a writer who shunned sophistry and wrote sincerely and simply. Though his editorials were not signed and were written for a paper that he did not own, he became a powerful personality in the United States. In October, 1918, Mr. Cobb was drafted into national service as an unofficial adviser at the Peace Conference, where he was an admirer of President Wilson and a firm advocate of the League of Nations. He was a Chevalier of the Legion of Honor and the Belgian Order of Leopold. He died in New York on Dec. 21, 1923.

COBB, IRVIN S (BREWSTER) (1876-). An American author, born at Paducah, Ky., and educated at the common schools and in private academies. He began as a reporter for papers in Paducah and Louisville. From 1904, when he became editor of the humorous section of the New York *Evening Sun*, he was section editor or contributor to New York newspapers, notably the *World*. In 1911, he became a staff contributor to the *Saturday Evening Post*, for

which he was also war correspondent in Europe at intervals between 1914-18. Among his numerous works are the following: *Funabashi* (a musical comedy, 1907); *Mr. Busyboddy* (musical comedy, 1908); *Back Home* (1912, produced as a comedy, 1915); *Cobb's Anatomy* (1912); *The Escape of Mr. Trimm* (1913); *Cobb's Bill of Fare* (1913); *Roughing It de Luzee* (1914); *Europe Revised* (1914); *Paths of Glory* (1915); *Old Judge Priest* (1915, 1923); *Fibble, D.D.* (1916); *Speaking of Operations* (1916); *Local Color* (1916); *Speaking of Prussians* (1917); *Those Times and These* (1917); *The Glory of the Coming* (1918); *The Thunders of Silence* (1918); *The Life of the Party* (1919); *From Place to Place* (1919); *Oh, Well, You Know How Women Are!* (1919); *The Abandoned Farmers* (1920); *A Plea for Old Cap Collier* (1921); *One Third Off* (1921); *Sundry Accounts* (1922); *Stickfuls* (1923); *A Laugh a Day Keeps the Doctor Away* (1923); *The Snake Doctor* (1923); and numerous series in periodicals. He also collaborated on dramatic productions.

COBB, T(YRUS RAYMOND) (1886-). Professional baseball player, born at Narrows, Ga. After a brief stay in the minors he joined the Detroit Club of the American League in 1905, becoming manager of that club in 1920. He is regarded as one of the best all-round players America's national game has ever developed, being especially renowned as a batsman and in his earlier career for his speed on the base paths.

COBERN, CAMDEN MCCORMACK (1855-). An American professor of theology, born at Uniontown, Pa., and educated at Allegheny College, at Boston University and in Europe. He was ordained to the ministry of the Methodist Episcopal Church in 1878, and was thereafter member of several conferences. In 1906, he became professor of the English Bible and the philosophy of religion in Allegheny College. Among his works are the following: *Ancient Egypt in the Light of Modern Discovery* (1892); *A Critical Commentary on the Books of Ezekiel and Daniel* (1901); *Bible Etchings of Immortality* (1905); *Recent Explorations in the Holy Land* (1914); *Studies of Immortality* (1916); and *The New Archaeological Discoveries and Their Bearing upon the New Testament and upon the Life and Times of the Primitive Church* (1917-1921).

COBLE, ARTHUR BYRON (1878-). An American mathematician, born at Williamstown, Pa. He was graduated at Pennsylvania College, Gettysburg, in 1897, after which he studied at Johns Hopkins University. He was instructor in mathematics at the University of Missouri in 1902-03. After a year of research work, he returned to Johns Hopkins as instructor in mathematics and continued there until 1918, attaining in 1909 an associate professorship. In 1918 he was called to the chair in mathematics at the University of Illinois. Among the subjects on which he has published the results of his studies are the theory of invariants, groups and correspondences, the quintic and sextic equations, symmetric binary forms and involutes, point set and cremona groups, and porisms. He was vice-president of the American Mathematical Society in 1917, and an associate editor of the *American Journal of Mathematics* during 1915-19.

COBURN, CHARLES DOUVILLE (1877-).

An actor-manager born at Macon, Ga. When he was 18, he became manager of the Savannah (Ga.) Theatre and two years later took up the stage as a profession. He played in stock through the Middle West and starred in *The Christian* and other plays. The Coburn Players were organized by him in 1905 for the production and promotion of the classic drama. He owns and controls the American and Canadian rights to *The Yellow Jacket* and *The Better 'Ole*. It was this last production which gave him his reputation. He created the rôle of "Old Bill" and later of "French Leone" (1920-21).

COCHIN, HENRY DENYS BENOIT MARIE (1854-). A French writer and legislator (see Vol. V). In 1914, he retired from the French Chamber of Deputies in favor of his son. He was for four years *Conseiller Général du Nord*. His works published since 1914 include: *Les deux guerres* (1916); *L'œuvre de guerre du peintre Albert Besnard* (1918); and *François Pétrarque* (published in the collection *Les cent chefs-d'œuvres étrangers* 1920).

COCHIN-CHINA. See FRENCH INDO-CHINA.

COCHRAN, CHARLES B. (1873-). A theatrical manager born in Sussex, England. He was educated at Oxford, became an actor and made his first appearance in New York. Subsequently he was press representative to various theatres, circuses and exhibitions in the United States. For three years he was personal representative of the late Richard Mansfield. After 1917, he became responsible for the productions of the Oxford Theatre and produced *The Better 'Ole*. His other successes include: *In the Night Watch* (1918); *The Man Who Came Back* (1920); *The League of Nations* (1921); *As You Were* (1918). He has been interested in many of the best known English theatres either as lessee or licensee.

COCKRAN, WILLIAM BOURKE (1854-1923). A distinguished American lawyer and orator (see Vol. V). He was active throughout his career in Democratic politics and was at the time of his death a member of Congress. Mr. Cockran was generally acknowledged to be one of the leading orators of his day, and was also one of the most prominent lawyers in the United States.

COCTEAU, JEAN (1891-). A French poet and pamphleteer born at Maison-Laffite, France. His work is a barometer of contemporary developments in art and music. Thus we have from his pen both Cubist and Dadaist poems, besides pamphlets in which he justifies his own evolution. He does not hesitate to condemn his own works after he has come to a new point of view in regard to the art of literary expression. He seems more at ease in the pamphlet than in any other type of writing, his most brilliant and successful work being perhaps, *Le Coq et l'Arlequin: Notes autour de la musique* (1918). His first novel, *Le Grand écart*, appeared in 1923. Like his poems, it is impressionistic. His other works are: *La Lampe d'Aladin* (poem, 1909); *Le Prince Frivole* (poems, 1910); *La Danse de Sophocle* (poems, 1912); *L'Art décoratif de Léon Bakst* (with Arsène Alexandre, 1914); *Prélude à l'après-midi d'un faune* (with others; 1915); *Le Cap de Bonne-Espérance*; *Potomak* (dedicated to Stravinsky, and condemned by the author afterward); *Parade* (a ballet with music by Eric Satie, 1917); and *Les Mariés de la Tour Eiffel*.

CODLING MOTH. See ENTOMOLOGY, ECONOMIC.

COD LIVER OIL. See **FOOD AND NUTRITION.**

CODY, HENRY JOHN (1868-). A British educator and clergyman (see Vol. V). In 1914-15 he was a member of the Ontario Commission on Unemployment. He was Minister of Education in the same province in 1918-19, and in 1921 chairman of the Commission on University Finances in Ontario. He was elected Archbishop of Melbourne, Australia, in the same year, but declined the office. Other offices held by him include: Chaplain of the Queen's Own Regiment, Toronto, Honorable Lieutenant-Colonel in the Canadian Militia, and member of the Board of Governors of Toronto University.

COE COLLEGE. An institution at Cedar Rapids, Iowa, founded in 1881. The student enrollment increased from 742 in 1918 to 924 in the year 1923-24, with 132 in the normal school and 262 in the college in the summer of 1923. The faculty was increased in the same period from 47 to 75 members, and the library from 15,926 to 21,000 volumes. Harry Morehouse Gage, D.D., LL.D., succeeded John Abner Marquis, D.D., LL.D., as president in 1921.

COFFIN, HENRY SLOANE (1877-). An American clergyman and author, born in New York, educated at Yale University, at New College, Edinburgh, the University of Marburg and the Union Theological Seminary, New York. He was ordained to the Presbyterian ministry in 1900, and after five years as pastor of the Bedford Park Church, New York, was appointed to the Madison Avenue Church in the same city in 1905. In the previous year he had been named associate professor of practical theology in the Union Theological Seminary. He was several times preacher to universities, including Yale and Harvard. Aside from editing and collaborating, he wrote a number of books, among them: *The Creed of Jesus* (1907); *Social Aspects of the Cross* (1911); *The Christian and the Church* (1912); *University Sermons* (1914); *The Ten Commandments* (1915); *Christian Convictions* (1915); *In a Day of Social Rebuilding* (the Lyman Beecher Lectures, at Yale University, 1918); *A More Christian Industrial Order* (1920), and *What is there in Religion?* (1922).

COFFMAN, DE WITT (1854-). An American naval officer, born in Shenandoah Co., Va. He graduated from the United States Naval Academy in 1876. During the Spanish-American War he served on the *Terror*. He was appointed lieutenant-commander in 1899; commander in 1905; captain in 1909, and rear-admiral in 1914. He served in many capacities, both ashore and afloat, and in 1916 was commander of the 3d Division of the Atlantic Fleet. Later in the same year he commanded the 6th Division of the Atlantic Fleet, and in June, 1916, he was promoted to be vice-admiral. He commanded the second battleship force in 1918 and in the same year was given the command of the 5th Naval District and Naval Operating Base at Hampton Roads. On Nov. 28, 1918, he was retired by operation of law. He was a member of the Board of Awards, Medals and Honors until Oct. 30, 1919.

COGHLAN, TIMOTHY AUGUSTINE SIR (1856-). An Australian statistician (see Vol. V). He was created Knight in 1914, and Knight Commander of the Order of St. Michael and St. George in 1918. He was again Agent-General for New South Wales in 1916-17, and

1920- . In 1918, he published a *History of Labour and Industry in Australia* (4 vols.).

COHAN, GEORGE MICHAEL (1878-). An American playwright and producer (see Vol. V). His recent successful plays and productions include: *Hit-the-Trail Holiday*; *Abie's Irish Rose*, written by Anne Nichols, *The Song and Dance Man*, and *The Rise of Rosie O'Reilly*, a satire on Cinderella.

COHEN, JULIUS HENRY (1873-). An American lawyer. He was born in Brooklyn, N. Y., and was graduated from the Law Department of New York University in 1896. In the following year he was admitted to the bar and began practice in New York City. He served as city attorney of the Transit Reform Committee of One Hundred (1900 to 1905), and as special counsel to the Public Service Commission, and to other civic organizations. He was a member of several legal societies and was the author of *Law and Order in Industry* (1916); *The Law—Business or Profession* (1916); and *American Labor Policy* (1918). He was a frequent contributor to legal periodicals.

COHEN, MORRIS RAPHAEL (1880-). An American professor of philosophy born in Minsk, Russia. He was brought to America when still a child, and was educated at the College of the City of New York. He pursued graduate studies in philosophy under Royce and James at Harvard and received the doctorate in 1906. He taught mathematics and philosophy at the College of the City of New York and at intervals at Columbia University, Johns Hopkins, and the New School for Social Research (New York). His writings, although limited largely to addresses before philosophical and mathematical bodies and to critical reviews in professional journals, exercised an influence beyond the ordinary. Professor Cohen also contributed polemical writings on political and social questions to the *New Republic* and other journals.

COHEN, OCTAVUS ROY (1891-). An American author, born in South Carolina where he received his secondary and college education. At first an engineer, he soon drifted into journalism, which he relinquished for authorship in 1915. He immediately became popular as a result of his stories printed in the *Saturday Evening Post* which concerned themselves with the adventures of the Southern Negro. If his people seemed to possess the usual mythical Negro qualities of drollery and misconceptions, his tales at any rate were spirited. Among others he wrote: *Polished Ebony* (1919); *Gray Dusk* (1920); *Come Seven* (1920); *Highly Colored* (1921); besides some plays and mystery romances.

COKE. In the period between 1914 and 1924 many important developments were recorded in the manufacture of coke which normally takes about 15 per cent of the bituminous coal produced in the United States and is essential for smelting the ores of iron and other metals, as well as for use in foundries, while it also finds application as a smokeless domestic fuel. In the United States the principal sources of coke had been the beehive oven, involving the loss of the many valuable by-products which could be obtained by the distillation of coal in a by-product oven where the valuable volatile content was preserved. The by-product oven of the Semet-Solvay type had been introduced in the United States in 1892, but its use had made slow progress until the beginning of the War, when

there was a considerable demand for benzol, toluol, and ammonia for use in the manufacture of explosives. These were produced at first for export but with the entry of the United States into the War in 1917 the demand increased so that in 1919, 56 per cent of all the coke manufactured in the United States was made in by-product ovens, and since that time the proportion has been even greater. See CHEMISTRY, ORGANIC.

The economic advantage of the use of the by-product oven is shown by the fact that a ton of coal of 2000 pounds so treated would yield approximately 19 pounds of sulphate of ammonia, 7.1 gallons of tar, 2.4 gallons of crude light oil, and 10,500 cubic feet of gas and 1425 pounds of coke. The ammonia thus obtained can be used in refrigeration and for the manufacture of the high explosive ammonium nitrate (see EXPLOSIVES), and for making the fertilizer ammonium sulphate. From the tar are derived many organic compounds, such as the aniline dyes, and the ultimate residue, coal tar pitch, is employed in road making, in making roofing and as a binder for fuel briquettes. In refining

dustry, with the exception of that in 1920, the last normal year. Compared with 1920, 1922 showed decreases of 29 per cent in the total production, 8 per cent in by-product coke, 58 per cent in beehive coke. The total production was less in 1922 than in any year since 1911, except 1921, when business was extremely depressed.

The exports of coke from the United States are principally to Canada, in 1923 totaling 1,104,770 tons, valued at \$11,889,897. The imports of coke into the United States in 1923 were 75,895 tons, valued at \$862,596.

COKE PRODUCTS. See CHEMISTRY, ORGANIC.

CKER, WILLIAM CHAMBERS (1872-). An American botanist, born at Hartsville, S. C. He graduated from South Carolina College in 1894 and took postgraduate courses at Johns Hopkins University and in Germany. He taught for several years in the summer schools of the Brooklyn Institute of Arts and Sciences, at Cold Spring Harbor, L. I., and in 1902 became associate professor of botany at the University of North Carolina. He was made professor in 1907 and Kenan professor of botany in 1920.

PRODUCTION OF COKE IN THE UNITED STATES

(Short Tons)
UNITED STATES GEOLOGICAL SURVEY

Years	Beehive	Per cent of total	By-product	Per cent of total	Total
1913	33,584,880	72.5	12,714,700	27.5	46,299,580
1914	23,335,971	67.5	11,219,943	32.5	34,555,914
1915	27,508,255	66.2	14,072,895	33.8	41,581,150
1916	35,464,224	65.0	19,069,361	35.0	54,533,585
1917	33,167,548	59.6	22,439,280	40.4	55,606,828
1918	30,480,792	54.0	25,997,580	46.0	56,478,372
1919	19,042,936	43.1	25,137,621	56.9	44,180,557
1920	20,511,092	40.0	30,833,951	60.0	51,345,043
1921	5,538,042	21.9	19,749,580	78.1	25,287,622
1922	8,573,000	22.0	28,551,000	78.0	37,124,000

the tar some crude light oil is obtained, but much more is secured by washing the coke oven gas. The crude light oil is valuable inasmuch as it yields benzol, the base of picric acid, and toluol, the base of the explosive trinitrotoluol, or TNT, which was employed so extensively in the War. The distillation of coal also yields illuminating gas.

Naturally the most important use of coke is in blast furnaces, foundries and metallurgical furnaces as a fuel for melting the charge of ore or metal, and in 1918 when there was a total production of 56,478,000 tons, about 88 per cent was used in this way. Coke also finds employment in the manufacture of water gas, in certain high-temperature manufacturing processes, as a steam boiler fuel, as a producer gas fuel and as a domestic heating fuel. In this last respect the use of coke was increasing because of the cost of coal.

As is shown by the accompanying table the production of beehive coke declined from 1913 to 1922, while that of by-product coke increased considerably, though in 1922 there was an increase in the production of beehive coke over the previous year due to the demand of the steel industry which in that year was very active. Of the total output of 37,124,012 net tons produced in 1922, only 23 per cent came from beehive ovens, as compared with 22 per cent in 1921, and 40 per cent in 1920; the amount produced being the smallest since 1888, except that in 1921. The output of by-product coke was the largest recorded since the beginning of the in-

In 1903, he was chief of the botanic staff of the Bahama Expedition of the Geographical Society of Baltimore. Professor Coker was a member of many scientific societies and the author of *The Plant Life of Hartsville, S. C.* (1912); *The Trees of North Carolina* (with H. R. Totten) (1916); and *The Saprolegniaceae of the United States* (1921). Besides these he contributed numerous articles on morphology and botany to scientific periodicals.

COLBY, BAINBRIDGE (1869-). An American lawyer and statesman, born at St. Louis, Mo., and educated at Williams College and at the Columbia and New York University law schools. In 1892, he began the practice of law in New York. From 1901, when he was elected a member of the New York Assembly, he took an active interest in State and national politics, being one of the founders of the Progressive National party. He served on numerous boards and commissions of the government, and in 1917 was a member of the American Mission to the Inter-Allied Conference, in Paris. In 1920-21, he was Secretary of State.

COLBY, EVERETT (1874-). An American lawyer (see VOL. V). He was a member of the Republican National Committee from 1916 to 1920. In 1917, he served in the United States Food Administration, was major in the Officers' Reserve Corps in 1918, and occupied the chairmanship of the Executive Committee of the League of Nations Non-Partisan Association founded in January, 1923.

COLBY COLLEGE. A coeducational institu-

vion at Waterville, Me., founded in 1813. The number of students increased from 440 in 1916 to 506 in 1923 and the library from 50,000 to 60,000 bound volumes besides pamphlets. Three buildings were erected or acquired in the 10 years between 1914 and 1924, including Hedman Hall, a dormitory for men; Foster House, purchased as a dormitory for women; and the Woodman Stadium, a memorial for the men of Colby who served in the War, given by Mrs. Eleanor Woodman. A fund amounting to \$500,000 was raised in 1920, of which \$150,000 was given by the Hon. Richard C. Shannon and \$125,000 by the General Education Board; in the three years following, the Board of Education of the Northern Baptist Convention gave \$100,000, and a campaign for a \$150,000 endowment was brought to a successful conclusion. President, A. J. Roberts, A.M.

COLE, LEON JACOB (1877-). An American zoölogist born at Allegheny, N. Y. He was educated at the University of Michigan (A.B., 1901) and at Harvard (Ph.D., 1906). He was assistant in zoölogy at Michigan (1898-02); Austin teaching fellow, Harvard (1903-06); chief of the division of animal breeding at the Rhode Island Experiment Station (1906-07), and instructor in zoölogy, Yale (1907-10). In 1910, Professor Cole went to the College of Agriculture, University of Wisconsin, where he was successively associate professor of experimental breeding (1910-14), professor (1914-18), and professor of genetics (1918-).

COLE, TIMOTHY (1852-). The foremost American wood engraver (see VOL. V). He published with his own illustrations, *Wood Engraving. Three Essays* (Groslier Club, New York, 1916), and *The Magic Line, a Study of the Technique of Wood Engraving* (New York, 1917).

COLEMAN, ARTHUR PHILEMON (1852-). Professor of geology in Toronto University (see VOL. V). He was president of the Geological Society of America in 1915, and of the Royal Society of Canada in 1921. He published, with W. A. Parks, *An Elementary Geology* (1922).

COLETTE, or COLETTE WILLY (pseudonym of Mme. Henri de Jouvenel) (?-). A French novelist whose work includes: *Claudine à l'école*; *Claudine à Paris*; *Claudine en ménage*; *Claudine s'en va*; *L'Ingénue libertine*; *Dialogues de bêtes*; *L'Envers du Music Hall*; *La Re traite Sentimentale*; *En Camarades*; *La Vagabonde*; *L'Entrave*; *La Paix chez les bêtes*; *Mitsou*; *Chéri*; *La Chambre éclairée*; *La Maison de Claudine*; *Le Blé en herbe*.

COLGATE UNIVERSITY. A nonsectarian institution at Hamilton, N. Y., founded in 1819. With the exception of the two war years, 1917-19, the university showed a steady growth for the decade between 1914-24. The student body increased from 518 to 771; the faculty from 47 to 57; the library, from 80,000 to 99,217 volumes; and the endowment, from \$2,000,000 to approximately \$3,000,000. A chapel and a dormitory housing 200 men were built in 1922. George Barton Cutten, Ph.D., D.D., LL.D., succeeded Elmer Burritt Bryan, LL.D., as president in 1922.

COLLEGES. See UNIVERSITIES AND COLLEGES.

COLLENS, CHARLES (1873-). An American architect, born in New York City and educated at Yale University and at the Ecole des Beaux Arts in Paris. He collaborated on

the plans for the buildings of the Union Theological Seminary in New York and of the Andover Theological Seminary in Cambridge, Mass.; also on those of the libraries of Ohio State University and Vassar College and of the Memorial Chapel of Williams College, as well as on the plans for Mrs. Eddy's Church in Concord, N. H., and for the Fifth Avenue Baptist Church, New York City.

COLLIER, WILLIAM MILLER (1867-). An American diplomat (see VOL. V). He was lecturer on international law at the New York Law School until 1918. In 1915, he held the same position at Wells College, and from 1916 to 1918 he lectured on diplomacy at George Washington University, of which he was president from 1917 to 1921. In 1914 he was appointed head of the American delegation to the International Conference at Christiania, to outline a government for the Islands of Spitzbergen. In 1917-18 he collaborated on *The Inquiry*, conducted by Col. E. M. House. He was a member of the Committee on Policies and Platform, authorized by the Republic National Committee in 1920. From 1916 to 1919 he was a national councilor of the United States Chamber of Commerce. In 1921 he was appointed Ambassador Extraordinary and Plenipotentiary to Chile. He was the recipient of several foreign decorations, during and after the War. He is author of: *The Law and the Higher Law* (1918); *George Washington's Will and George Washington University* (1918), and *College Influences Before the War and After the War* (1920).

COLLINS, CHARLES WALLACE (1879-). An American lawyer. He was born at Galion, Ala., and studied at the Alabama Polytechnic Institute, the University of Chicago, and Harvard. He was admitted to the bar in 1901 and for five years practiced in Birmingham, Ala. From 1915 to 1918, he was in charge of the Economic Section of the Legislative Reference Service of the Library of Congress, and the director of this section from 1918 to 1920. He assisted in drafting a bill for a national budget, and in 1920-21 was law librarian of Congress, serving also as counsel of the Bureau of the Budget. He wrote *The National Budget System in American Finance* (1915); *The British Budget System* (1920), and contributed articles on constitutional law and public finance to many law periodicals.

COLLINS, JOSEPH (1866-). An American neurologist, born in Brookfield, Conn. He received the degree of M.D. from New York University in 1888, and after some years of private practice took up the specialty of neurology; in 1907, he was made a professor of that subject in the New York Post-Graduate Medical School. He was later a co-founder and visiting physician to the New York Neurological Institute. In addition to his attainments as a practitioner of medicine, Dr. Collins has long been known in general literature. His major writings, medical and secular, are: *Letters to a Neurologist* (1908; second series 1910); *The Way with the Nerves* (1911); *Sleep and the Sleepless* (1912); *Neurological Clinics* (1918); *My Italian Year* (1919); *The Doctor Looks at Literature* (1923). He has also been an extensive contributor to periodical literature, both medical and secular.

COLLINS, ROSS ALEXANDER (1880-). An American lawyer, born at Collinsville, Mass.

He graduated from Kentucky University in 1899, and from the Law Department of the University of Mississippi in 1901. In the same year he began practice in Meridian, Miss. He was elected attorney general of the State in 1912 and was re-elected in 1915. In 1919, he was a candidate for governor in the Democratic primary. He was elected to the 67th Congress in 1921, and in 1922 was re-elected to the 68th Congress.

COLLITZ, HERMANN (1855-). An American philologist (see VOL. V), professor of German language and literature at Johns Hopkins. He is editor of *Hesperus: Schriften zur germanischen Philologie* and author of *Sammlung der griechischen Dialektschriften* (1884-1915).

COLLOIDAL STATE, COLLOIDAL DISPERSION. See PHYSICAL CHEMISTRY.

COLLOIDS. See CHEMISTRY; BOTANY; SOIL.

COLOMBIA. A South American republic situated in the northwestern part of the continent. Because of boundary disputes its frontiers were not definitely delimited in 1924. Its area is variously estimated at 435,000 square miles to 440,846 square miles. The population at the census of Mar. 5, 1918, was 5,855,077, of whom 158,428 were Indians. The population in 1912 was 5,072,604. The capital, Bogota, had 143,994. Other large cities with their populations were: Barranquilla, 64,543; Cartagena, 51,382; Medellin, 79,146; Cali, 45,525; Manizales, 43,203.

Industry and Trade. Coffee was the principal crop and chief article of export, for Colombia ranked second only to Brazil as a coffee producing country. The export totaled 235,368,038 pounds in 1922, with a value of \$35,705,780, the United States taking 191,848,984 pounds. The export in 1913 had been 134,136,000 pounds. Bananas were the second most important agricultural product, with exports in 1922 of 160,298 tons, valued at \$3,427,051. In 1913, 157,385 tons had been exported. Other important crops were rice, sugar, cotton, corn, tobacco and wheat, while vegetable ivory, rubber, gums, medicinal plants and dyewoods were important forest products. Gold mining, one of the oldest industries in Colombia, has been carried on since Spanish colonial days, and exports, which represented practically the entire production, were \$5,699,920 in 1922. The platinum mines, which furnished the greatest part of the world's supply, had an annual production worth some \$2,000,000. The emerald mines, controlled by the government, were the largest producers in the world. The petroleum industry was still in its infancy but promised to be of increasing importance. One foreign company opened a considerable number of producing wells, and it was reported that there were other deposits of value. The impetus given manufacturing during the War placed many small-scale industries in the towns on a stable footing, and progress was made in the production of cotton textiles, shoes, cigarettes, beer, flour, soap and matches. The making of Panama hats, a native industry requiring no machinery, prospered. The foreign trade of Colombia grew steadily. The balance of trade was favorable for many years, with the result that the Colombian peso, which is worth \$0.973, was in 1918 above par in New York, and in 1924 practically at par. Exports in 1922 were valued at \$52,390,199 compared with \$33,457,370 in 1913; and imports

for 1922 were \$42,978,101, compared with \$27,822,385 in 1913. The United States took on the average about 70 per cent of all exports and supplied some 47 per cent of all imports, so that it ranked first in Colombian foreign trade, with Great Britain second. Exports to the United States in 1922 amounted to \$36,064,000 as compared with \$15,714,000 in 1913, while imports from the United States were \$20,137,000, compared with \$7,647,000 in 1913. The chief exports were coffee, gold, bananas, platinum, and hides; and the principal imports, textiles, food-stuffs, machinery, and construction material.

Finance. The Colombian national debt as of May 31, 1923, was 45,698,382 pesos. This figure comprised 22,076,730 pesos of foreign debt and 23,621,652 of internal debt. The budget for the year 1924 showed estimated revenues of 38,285,397 pesos as against 12,043,145 pesos in 1912, and 42,965,953 pesos for expenditures, which amounted to 12,500,000 pesos in 1912. The deficit was to be covered by a \$5,000,000 foreign loan for the retirement of certain treasury bonds. Total currency in circulation as of Dec 31, 1923, was 38,950,292 pesos. During July, 1923, the Colombian government used the first \$5,000,000 installment of the American payments on the \$25,000,000 guaranteed under the 1921 treaty to establish a central bank of issue modeled on the Federal Reserve Banks. This exerted a stabilizing effect on the finances and currency of the country. An American mission gave Colombia valuable assistance in its finances in 1923.

Communications. In 1922 there were 937 miles of railway, compared with 620 in 1911. Construction work was done during 1923 on the Pacific railway, so that this line was complete to Zarzal, a distance of about 200 miles from the port of Buenaventura. The 1923 Colombian congress passed laws providing for the expenditure of the remaining \$20,000,000 of American payments on the construction of 11 railroads and other public improvements.

History. The outstanding events in Colombia's history for the decade centred in the settlement of the Panama question with the United States. After the failure of the treaty of 1909 a new pact was drawn up in 1914 which contained a plain apology, attributed to the Secretary of State at the time, William J. Bryan, for the American part in the Panama revolution; the agreement gave Colombian citizens the same rights as those of American citizens in the use of the Canal Zone and the Panama Canal, and it provided for the payment of a \$25,000,000 compensation in five equal annual installments. Colombia ratified the treaty, but the American Senate, incensed at its apologetic tone, withheld its consent until 1921, when, under the Republican administration, the objectionable phrases were withdrawn. On Nov. 5, 1921, the Colombian Senate accepted the treaty as revised, and on Mar. 2, 1922, the House of Representatives finally acceded, so that in the fall Colombia received its first payment of \$5,000,000. From 1914 to 1918, José Vicente Concha served as president; and his minister for foreign affairs, Marco Fidel Suárez was elected to the office for 1918-22. A decree issued by President Suárez nationalizing oil resources caused considerable excitement in business circles but was declared unconstitutional by the Supreme Court. President Suárez resigned in 1921 because of opposition encountered in the Congress, and a

provisional president, Jorge Holguin, was appointed to fill out the term. For the years 1922-26, General Pedro Nel Ospina, Conservative, was elected. Colombia remained a neutral during the War. In 1920 it joined the League of Nations. Relations with Panama continued unfriendly in 1924.

COLORADO. Colorado is the seventh of the United States in size (103,948 square miles), and the thirty-third in population; capital, Denver. The population increased from 799,024 in 1910 to 939,629 in 1920, a gain of 17.6 per cent. The white population increased from 783,415 to 924,103; the number of native whites rising from 656,564 to 807,149, while the foreign-born white population decreased from 126,851 to 116,954. The Negro population decreased slightly from 11,453 in 1910 to 11,318 in 1920, while the number of Japanese increased from 2300 to 2464. The urban population rose from 404,840 in 1910 to 453,259 in 1920, the rural population from 394,184 to 486,370. The principal cities, with their population in 1910 and 1920, are Denver (q.v.), 213,381 and 256,491; Pueblo, 41,747 and 43,050, Colorado Springs, 29,078 and 30,105.

Agriculture. While the population of the State increased 17.6 per cent in the decade 1910 to 1920, the number of farms increased 29.8 per cent, from 46,170 to 59,934. In 1910 the acreage was 13,732,113, in 1920 it was 24,62,014, while the acreage of improved land in farms in those years was 4,302,101 and 7,744,757 respectively. The total value of farm property apparently increased in the decade, from \$491,471,806 to \$1,076,794,749, or 119.1 per cent; the average value of farm property, from \$10,645 to \$17,966. In interpreting these values, and indeed all comparative values for the decade 1914-24, the inflation of currency in the latter part of the period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. The total percentage of land used for agricultural purposes in 1910 was 20.4 per cent; in 1920, 36.9 per cent. The percentage of improved land in farms remained practically constant, being 31.8 per cent in 1910 and 31.7 per cent in 1920. Of the total of 59,934 farms in 1920, the number operated by owners was 45,291; by managers, 880; by tenants, 13,763. There was an increase in the decade of about 8300 owners, 93 managers, and 5370 tenants. The white farmers numbered 59,381 in 1920, as compared with 45,596 in 1910; foreign-born farmers, 9535, as compared with 8398; and colored farmers, including Negroes, Indians, Japanese and Chinese, 553 as against 574. There were 20,965 farms free from mortgage in 1920; 26,822 in 1910. Those under mortgage numbered 21,131 in 1920, compared with 9636 in 1910. The number of dairy cows rose to 233,747 in 1920, from 144,734 in 1910; beef cows to 691,731, from 405,884; sheep, to 1,813,255 from 1,305,596. Of the 59,934 farms in 1920, 28,756 were irrigated, as compared with 25,857 in 1910, the area irrigated increasing from 2,792,032 to 3,348,385 acres. The estimated production of the chief crops in 1923 was corn, 31,267,000 bushels; wheat, 16,157,000 bushels; oats, 6,677,000 bushels, barley, 5,609,000 bushels; potatoes, 16,786,000 bushels; hay, 2,393,000 tons; sugar beets, 1,890,000 short tons. Comparative figures for 1913 are: corn, 6,300,000 bushels; wheat, 9,680,000; oats, 10,675,000;

barley, 3,250,000; potatoes, 9,200,000; hay, 1,824,000 tons. Apple trees of bearing age numbered 1,688,425 in 1910 and 1,777,737 in 1920. In 1909, 3,559,094 bushels of apples were grown; in 1919, 3,417,682.

Education. The high standard always maintained in education in Colorado continued to be upheld in the decade 1914-1924. During this period a closer relationship was established between the various units of the school administrative forces. This has resulted in a marked progress along all educational lines, resulting in an increase in the number of centralized, consolidated and standardized schools. In 1914 there were 120 centralized and consolidated schools, and in 1920, 130. The standardized schools in 1914 numbered 337; and in 1923, over 600. Colorado was the first of the States to adopt Americanization as a part of its system of education, and was also the first to adopt modern tests and measurements. The legislature of 1921 passed measures providing for a minimum teachers' salary.

The enrollment in the grades below high school increased from 110,963 in 1914 to 195,828 in 1920. The high school enrollment increased from 17,676 in 1914 to 24,000 in 1920. In 1923 there were over 3000 grade schools, and 260 high schools. The total expenditure for the administration of the educational system increased from about \$7,000,000 in 1914 to approximately \$18,000,000 in 1922. The percentage of illiteracy decreased from 4.4 per cent in 1910 to 3.4 per cent in 1920, among the native white population from 2.4 per cent to 2 per cent. Among the foreign-born whites it increased from 11.3 per cent to 12.8 per cent.

Mining. Colorado is one of the most important of the mineral-producing States. Gold, however, was no longer its most important mineral resource, having latterly been superseded by coal. The products in the order of their value are coal, gold, silver and clay. The progress of the coal industry in the decade 1914-24 is shown by these comparative figures: 1914, production 8,170,559 short tons, value \$13,601,718; 1915, 8,624,980 and \$13,599,264; 1916, 10,484,237 and \$16,964,104; 1917, 12,483,336 and \$27,669,129; 1918, 12,407,571 and \$33,404,743; 1920, 12,278,225 and \$42,829,000; 1921, 9,122,760 and \$32,377,000; 1922, 10,019,597 short tons. The decrease in gold production is indicated as follows: 1914, 960,345 fine ounces, 1915, 1,084,323, 1916, 926,566, 1917, 760,901, 1918, 616,864, 1919, 478,266; 1920, 366,504; 1921, 330,659, and 1922, 308,314. As silver is derived chiefly from ores which are also gold-bearing, a decrease in production of that metal has accompanied that of gold. Figures for several of the years of the decade will indicate the progress of the silver mining industry. In 1914, 8,796,065 fine ounces were produced, in 1915, 7,027,972, in 1917, 7,304,353; in 1920, 5,409,335; in 1921, 5,631,657, and in 1922, 5,855,911. A considerable amount of copper is also produced in the State: in 1914, 6,639,173 pounds, valued at \$883,010; 1919, 3,560,207 pounds. \$662,198, 1922, 3,373,454 pounds, \$455,416. Other important minerals produced are lead and zinc, of which in 1922 23,477,200 and 23,258,000 pounds respectively were marketed. Colorado produces also a small quantity of petroleum. The total value of the mineral products in 1921 was \$54,045,056, compared with \$76,037,896 in 1920, and \$52,161,660 in 1914.

Manufactures. The manufacturing establishments of the State increased from 2034 in 1909 to 2126 in 1914, and to 2631 in 1919, while the number of persons engaged in manufacture rose from 34,115 to 33,715 and to 44,729. The capital invested in these three years, was \$162,667,801, \$181,776,339, and \$243,826,617, respectively. The value of the products apparently increased from \$130,044,312 in 1909 through \$136,839,321 in 1914, to \$275,622,335 in 1919, but this increase was largely due to the change in industrial conditions brought about by the War, and cannot be properly used to measure the growth of manufactures between the industrial censuses of 1914-19. The increase in the number of wage earners and the number of establishments, on the other hand, indicates a decided growth in the manufacturing activities of the State. The most important industries in point of value of products are those connected with slaughtering and meat packing, which were valued in 1909 at \$9,657,000; 1914, \$12,726,000; 1919, \$41,008,000. Flour and grist mill products in 1909 were valued at \$7,868,000, 1914, \$7,536,000; 1919, \$19,954,000. Car construction and repairing had a production in 1909 valued at \$6,559,000; 1914, \$6,822,000; 1919, \$15,130,000. Foundry and machine shop products in those years were valued at \$5,907,000, \$4,575,000, and \$17,778,000 respectively. Other important industries are the manufacture of butter, cheese and condensed milk, printing and publishing, saw mills and grist mills. The two most important manufacturing cities in the State are Denver and Pueblo. In Denver, the number of manufacturing establishments, with total value of their product, was in 1909, 765 and \$46,925,000; 1914, 885 and \$46,982,000; 1919, 1097 and \$125,411,000. Pueblo, in 1909, had 92 manufacturing establishments; in 1914, 108, and in 1919, 120. The value of the products in those years was \$3,009,000, \$3,324,000, and \$13,978,000.

Finance. For finance, see STATE FINANCES.

Political and Other Events. Much of political and industrial importance happened in Colorado in the decade 1914-24. In 1914 serious coal strikes in the southern coal mines of the State created a situation of national importance. The apparent inability of the State authorities to control it resulted in a call for Federal aid, and President Wilson, on April 28, ordered Federal troops to the State to prevent conflicts between the State militia and the strikers. These troops remained in the State throughout the year. See STRIKES AND LOCKOUTS. In the elections of 1914 the Democratic State administration was overthrown and George A. Carlson was elected governor. Senator Thomas, Democrat, was reelected. The State, by a small majority, voted for constitutional prohibition at this election. Conflicts between the State Legislature and Judge Ben B. Lindsey in 1915 attracted wide attention through the prominence of the latter as an authority on juvenile courts and the reformation of delinquent children. The Legislature attempted to pass laws abolishing the juvenile courts so as to remove Judge Lindsey from office. The attempt grew out of the refusal of Judge Lindsey to divulge on the witness stand confidential conversations with a boy of 12. He declared that the whole juvenile court was founded on the protection of children who gave their confidence to him. He was declared guilty of contempt of court and was fined \$500.

In 1916, in spite of a vigorous campaign waged by the Republicans and the assistance of Col. Theodore Roosevelt, President Wilson carried the State by the largest plurality ever given by the State and the entire Democratic State ticket was elected. President Wilson received 178,816 votes and Charles E. Hughes 102,308 votes. Julius C. Gunter, Democrat, was elected governor, and all the other State officers elected were Democrats. The Legislature, however, had a Republican majority of one. During 1917 the State subscribed over \$40,000,000 to Liberty Loans, and voluntary enlistments to the army and navy amounted to over 20,000. In 1918 elections for governor, congressmen, and State officers, were held. The Republicans returned to power, electing their candidate for governor, Oliver H. Shoup and sent Lawrence I. Phipps to the Senate. In December of this year, the State became "bone dry" in accordance with a constitutional amendment endorsed by the people. In 1920 Governor Shoup was reelected and S. D. Nicholson, Republican, was elected to the United States Senate. In the presidential election of this year, Warren G. Harding received 173,248 votes and James M. Cox 104,936. In June, 1921, cities in the central and southern part of the State suffered severely from devastating floods. At Pueblo, as the result of the breaking of a dam, over 350 city blocks were flooded. Many buildings were destroyed, and there were many deaths. The total damage amounted to nearly \$15,000,000. In November, 1921, as a result of a miners' strike in Huerfano County, Governor Shoup established martial law. In the elections in 1922 the Democrats again were successful. William E. Sweet was elected governor. This year witnessed a reaction from radical movements which had been more or less active in the State in the years previous. William Z. Foster, the radical labor leader, was ejected from the State. On Jan. 1, 1923, William E. Sweet, elected in the previous year, assumed the office of governor. As the result of failure of the Arizona Legislature to ratify the so-called Colorado River Compact, a difference arose between the governments of the two States. An alternative plan proposed by Arizona encountered strong opposition in Colorado. Samuel D. Nicholson, United States Senator, died in May, 1923, and on May 17, Alva B. Adams, Democrat, was appointed to succeed him.

Legislation. The Legislature meets biennially. Among the important measures passed during the period 1914-24 were those noted below. In 1915 a workmen's compensation law was passed. In 1917 a special session of the Legislature voted \$2,500,000 in war bonds. The Legislature in this year amended the liquor laws, passed a pure food law, and amended the laws relating to elections. The Legislature of 1919 ratified the Federal Prohibition Amendment and reenacted the workmen's compensation law amendments. In 1921 the Legislature referred to the electors an amendment prohibiting aliens from holding land in the State. Laws relating to corporations were amended and an inheritance tax measure enacted. A special session of the Legislature, held in April, 1922, provided for the creation of an improvement district against which bonds to the amount of \$6,720,000 were authorized for the construction of a railway tunnel through the mountains near James Peak, northwest of Denver, on the line of the Denver

and Salt Lake Railroad. A second act authorized the organization of a flood control district along the Arkansas River for the protection of Pueblo and other communities. The Legislature of 1923 passed measures to compensate veterans of all wars, beginning with the Civil War, to facilitate the cooperative marketing of agricultural products.

COLORADO, UNIVERSITY OF. A coeducational State institution at Boulder, Colo., founded in 1876. The student enrollment increased 100 per cent, from 1236 in 1914 to 2503 in 1923-24; the faculty increased from 200 to 268 in the same period, and the number of volumes in the library from 100,000 to 150,000. Twenty residence fellowships were established in 1922, and separate departments in journalism and anthropology were opened. The General Education Board gave \$700,000 to be used for the construction of a medical plant at Denver, and a yearly stipend of \$50,000 for its maintenance over a term of years; and the Liberal Arts Building, the Macky Auditorium, a University Hospital and Medical School, the State Psychopathic Hospital and Nurses' Home, the gymnasium, the engineering laboratory, a greenhouse, and a tunnel for the heat lines were built during the decade. In 1918 George Norlin, Ph.D., succeeded Livingston Farrand, LL.D., as president.

COLORADO COLLEGE. An institution at Colorado Springs, Colo., founded in 1874. The student enrollment increased from 561 in 1914 to 700 in 1923-24, the number of members in the faculty from 51 to 69, and the number of volumes in the library from 75,000 to 100,000. The endowment was increased from \$1,042,000 to \$1,689,000 during the same years and the annual income from \$55,165 to \$244,312. The General Education Board also promised to give \$300,000 to the endowment on condition that the college raise \$600,000 additional. A new system of honors courses permitting greater specialization and wider scope for individual investigation was established for members of the two upper classes who distinguished themselves in the work of the first two years. It included among its requirements papers embodying the results of individual reading and study, a final dissertation, and a comprehensive examination, in the field of concentration. The entrance requirements were to be changed in the fall of 1924. C. A. Duniway succeeded William F. Slocum as president. Charles C. Mierow was acting president in 1923-24.

COLOR-BLINDNESS, TRANSMISSION OF. See HEREDITY.

COLORED METHODISTS. See METHODISTS, COLORED.

COLUM, PADRAIC (1881-). An American poet and dramatist, born at Longford, Ireland. One of the early leaders of the Irish literary renaissance, he soon gained prominence as editor of the *Irish Review* and a writer of charming lyrics. He came to the United States in 1914, where, in company with Ernest Boyd and others, he did much to familiarize Americans with the current trends in Irish literature. His later work was largely concerned with the preparation of children's books, done with that meticulous care and poetic sense so conspicuous in all his writings. Among his books were: *Wild Earth* (1907); *Three Plays* (1916); *The Adventures of Odysseus* (1918); *The Golden Fleece* (1921); *Castle Conquer* (a novel, 1923).

COLUMBIA UNIVERSITY. A nonsectarian institution founded in 1754, whose principal buildings at Morningside Heights, New York City, comprise Columbia College, a college of liberal arts for undergraduate men; Schools of Mines, Engineering, Chemistry, Architecture, Journalism, Business, and Dentistry; the non-professional graduate faculties of political science, philosophy, and pure science; Barnard College, for undergraduate women; Teachers' College, including the quarters of education and practical arts; and the university library. The College of Physicians and Surgeons is on West Fifty-ninth Street and the College of Pharmacy on West Sixty-eighth Street. In addition to the regular session there is a thorough system of university extension, and in the summer, besides the summer session at Morningside Heights, a summer camp at Morris, Conn.

The enrollment of the university grew steadily from 14,098 in 1913 to 28,861 in 1923-24, including the 12,675 of the summer session of 1923 but excluding duplicates; and the number of members in the faculty was increased from 907 in the earlier year to 1830 in the later. The library was increased during the period from 550,000 bound volumes and 75,000 German dissertations to 863,341 volumes; the income from \$2,793,332.32 to \$6,403,808.99; and the productive funds from \$29,038,975.73 to \$47,537,200.94. An extensive building programme was laid out in 1919. By the close of 1923 the Faculty House was in use, and the new residence hall for women, the School of Business and the library for Teachers' College were all expected to be ready within a year. Work was begun on an additional residence hall for Barnard College. Plans for other buildings in the original programme were temporarily abandoned on account of the excessive cost of construction, which was estimated at a sum between \$10,000,000 and \$12,000,000. Approximately \$12,426,000 had been collected towards the \$15,000,000 called for by the plans for the new buildings for the College of Physicians and Surgeons, and a lot at Washington Heights was donated in 1919 for the joint use of the college and the Presbyterian Hospital. Women were admitted to the College of Physicians and Surgeons for the first time in 1918. In 1923 the College of Dental and Oral Surgery of New York was merged with the School of Dentistry, established in 1917. The school thus formed was known as the School of Dental and Oral Surgery of Columbia University and was located at 302 East Thirty-fifth Street and 309 East Thirty-fourth Street.

Lincoln School was established in 1917 under the direction of Teachers' College for the purpose of scientific experimentation and constructive work in the reorganization of elementary and secondary education. In 1919 psychological tests were instituted which might be substituted for entrance examinations for Columbia College, and a course in contemporary civilization for freshmen was given to take the place of courses formerly given in history, economics and philosophy. Home study courses were offered in the same year under the department of university extension. Institutes of educational research, cancer research and public health were founded in 1921. The faculty of law completed in 1923 the plan for the organization of advanced instruction and research in the field of public and private law, and in May the trustees created the degree of doctor of law (Doctor

Juris) to be conferred on practically the same terms as the degree of doctor of philosophy in other fields of knowledge. The objection that had been offered to the institution of this new degree, that it paved the way for an objectionable diversification of doctorate degrees, was met by the trustees of the university with the declaration that the degree of doctor would be confined to the four traditional academic groups, law, medicine, philosophy, and theology. Further to ensure uniformity in the awarding of the doctorate degrees in philosophy and law, a single representative committee drawn from the faculties of political science, philosophy, pure science, and law were to have direct supervision of the work of candidates for these degrees. Arrangements were made in 1919 for the preparation and publication through the Columbia University Press of the complete works of John Milton, under the editorship of members of the department of English and comparative literature. Early in the War a plan of mobilization of the university resources was drawn up, which the Bureau of Education of the Department of the Interior at Washington approved and submitted as a model to all the colleges and universities in the country. A war hospital of 1000 beds was organized and turned over to the government as United States Army General Hospital No. 1. More than 2000 students left the university before June 1, 1917, to enter the service, and leave of absence was granted in that time to approximately 200 members of the faculty for war work. President, Nicholas Murray Butler, LL.D. (Cantab), D.Litt. (Oxon.), Jur. D. (Paris).

COLUMBUS. The capital of Ohio. The area of the city was increased from 14,570.2 to 15,824.5 acres by the annexation of Linden Heights village in 1921; the population increased from 181,511 in 1910 to 237,031 in 1920, and to 261,082, by the estimate of the Bureau of the Census, for 1923.

A new Federal plan municipal charter of the home-rule type, with nonpartisan ballot, preferential voting, recall of elected officials, the referendum, and a small council elected at large, went into effect in 1916. A city planning commission was created and carried on an active programme in 1920; its membership comprised the city engineer and director of public safety and citizens, including a professor of municipal engineering, a real estate man, an architect, and a newspaper publisher. Plans were developed for the establishment of an elaborate civic centre along the Scioto River. Extensive public works were constructed. The reservoir in the Scioto River was increased in capacity by raising the dam until it was capable of containing 5,833,000,000 gallons, and the purification and pumping works were enlarged. The cost of this was met by a \$3,000,000 bond issue voted in 1919. A second large dam was being constructed to increase the water supply. In 1921 three concrete arch bridges were opened to traffic to replace the bridges lost in the great flood of 1913. The Mound Street Bridge, 1050 feet long and supported by 9 arches, was built by the city at a cost of \$6,000,000; the others, at Broad Street and Town Street, were built by Franklin County at a cost of \$600,000 apiece. Nearly \$6,000,000 was expended on a school building programme. The value of manufacturing increased from \$70,000,000 in 1914 to \$100,000,000 in 1923.

COLVIN, SIR SIDNEY (1845-). An

English art and book critic (see Vol. V). Besides being a member of numerous learned and art societies, he is author of *John Keats, His Life and Poetry* (1917), and *Memories and Places* (1921).

COMBES, (JUSTIN LOUIS) EMILE (1835-1921). A French statesman (see Vol. V). He became a member of the Briand ministry without portfolio in 1915. He died on May 26, 1921.

COMETS. See ASTRONOMY.

COMFORT, WILL LEVINGTON (1878-). An American novelist, born at Kalamazoo, Mich., and educated in the public schools of Detroit. He served in the United States Cavalry during the Spanish-American War and in 1899 was war correspondent in the Philippines and China. In 1904 he was war correspondent in Japan and Russia. Besides numerous contributions to periodicals he wrote the following: *Routledge Rides Alone* (1910); *Fate Knocks at the Door* (1912); *Down Among Men* (1913); *Midstream* (1914); *Red Fleece* (1915); *Lot & Company* (1915); *Child and Country* (1916); *The Hive* (1918); *The Shielding Wing* (1918); *Son of Power* (1920); *This Man's World* (1921); and *The Public Square* (1923).

COMMISSION AND COMMISSION-MANAGER PLAN OF CITY GOVERNMENT. See MUNICIPAL GOVERNMENT.

COMMUNISM. As the type of socialist doctrine which, on the basis of the Marxian Communist Manifesto, strives for the attainment of the socialist aim by means of the dictatorship of the proletariat, communism is a recent development and quite different from the earlier interpretation. While the communists believe, like the socialists, in collective ownership of the means of production, they are unalterably opposed to any temporizing and to any coöperation toward this end with the bourgeois arties. The communists believe that the revolutionary working classes must seize the power and set up a dictatorship of the proletariat in preparation for the socialist state. This does not mean, however, that the communists reject democracy as such, but they hold that during the period of transition until the socialist state is achieved, majority rule is unfeasible and the struggle must be carried on by a class conscious minority. In their insistence on the ultimate application of majority rule and in their theory of the state, the communists are at variance with the syndicalists, who regard the militant minority as the tool of all progress and whose aim is the industrial society with the workshop as the basis of organization. The tactics of the communists are primarily political, those of the syndicalists exclusively industrial.

Modern communism is distinctly a fruit of the Russian Bolshevik revolution of November, 1917. Previous to the War two socialist groups, differing in aim and procedure, existed in Russia. The first group, the Revolutionary Socialists, regarded Russia as an agricultural country whose economic development must necessarily be different from that of western Europe. The second group, the Social Democratic party, stood squarely on the basis of the Marxian doctrine of the class struggle and held that Russia must first go through the industrial and capitalistic stage in order to attain the socialist ideal. It was this group or rather its majority element, the Bolsheviks, who through their

majorities in the Workmen's and Soldiers' Councils seized the power in Russia in November, 1917, organized the communist state, and elaborated the communist doctrine. To the Bolsheviks, Russia was the arena of the class struggle in which the conflict between the proletariat and the bourgeoisie had to be fought out. They set up a dictatorship of the proletariat—that is, of the communists—and suppressed all elements opposed to their rule. They had no illusions as to the advisability of applying their principles of liberty and democracy to existing conditions. In their opinion Russia was in a state of transition during which all opposition had to be wiped out ruthlessly and preparations had to be made to bring about the socialist state. The executive power of the Russian communist state was in the hands of the Board of People's Commissaries, which derived its authority from the All Russian Congress of Soviets, the members of which were communists with very few exceptions. The Communist party in Russia, which wielded absolute power, seldom exceeded a membership of 700,000. It was the agency through which the government kept in contact with the trade unions and all other organizations.

Under the auspices of the Soviet government, the Third or Communist International was organized in March, 1919, at Moscow. At its second congress in Moscow, July, 1920, it was declared to be established for the purpose of organizing common action among the workers of various countries who are striving toward a single aim: the overthrow of capitalism, the establishment of the dictatorship of the proletariat and the International Soviet republic, the common abolition of classes, and the realization of socialism as the first step to the communist society. Twenty-one conditions of membership were laid down at this congress. The third congress was held in Moscow, June 22–July 12, 1921, with 510 delegates representing 48 countries. Having in the preceding congresses defined the sharp theoretical lines of demarcation between the revolutionary and the reformist elements of the proletariat of all countries, the Internationale devoted itself now to tactics and methods of organization of the Communist parties. At this time the organization had a membership of 2,800,000 in 51 countries. At the fourth congress, Nov. 7–Dec. 3, 1922, which was attended by 400 delegates from 62 countries, representing a membership of 2,200,000, further measures were taken to make the Third International the truly international communist party. Separate from the Third International, but connected with it, was the Young Communist International, which was organized in Moscow in December, 1919, and included most of the socialist youth in all countries.

Outside of Russia the Communists were strongest in France, Germany and Italy. After the French Socialist party had voted against affiliation with the Third International in 1921, the radical minority withdrew and formed the French Communist party. The party had 60,000 members in 1923 and secured 29 seats in the Chamber in the elections of May, 1924. The German Spartacists formed the German Communist party in December, 1918. At the end of 1923 it reported a membership of 300,000. It grew still further in strength during the early part of 1924 and obtained in the elections of May in the same year 60 seats in the Reichstag. The Italian Communist party was

born out of the secession of Bombacci and his followers from the Leghorn Congress, January, 1921. The party, which had 50,000 members at the time of its formation, reported only half that number at the end of 1922 and declined still further during a year and a half of Fascist rule. The Communist party of Great Britain, formed in August, 1920, out of the British Socialist party, a section of the British Socialist Labor party and other small groups, was negligible in membership and influence.

The radical dissenting elements of the American Socialist party established the American Communist party in September, 1919. A day later the Communist Labor party was founded by John Reed. The differences between the two groups were very slight, and a section of the Communist party united in 1920 with the Communist Labor party to form the United Communist party. The American government took strong action against the Communists, and as a result the movement in the United States was driven underground. When it became imperative to conduct activities publicly because of the great number of left wing Socialists who were joining the Communists, the Workers' party was formed in December, 1921, to give authoritative expression to the communist movement in the United States. But the Communist party continued to exist secretly and held in August, 1922, a convention in the woods near Bridgman, Mich., which was raided by Federal and State authorities. The participants in the convention were prosecuted. On April, 1923, the Communist party voted to desolve and designated the Workers' party as its successor. The latter held three conventions, the last in Chicago, Dec. 30–Jan. 2, 1924. Its membership in 1923 was 15,233. See also SOCIALISM.

COMSTOCK, ADA LOUISE (1876–). An American educator, born in Moorhead, Minn. She studied at the University of Pennsylvania from 1892 to 1894, and at Smith College in 1897. She took postgraduate courses at Columbia, Mt. Holyoke and the University of Michigan. She served on the faculty of the University of Minnesota as professor and dean of women until 1912, when she was appointed dean of Smith College. She was a member of several societies and from 1921 was president of the American Association of University Women.

COMSTOCK, F. RAY (1880–). An American theatrical producer born in Buffalo, N. Y., who began as a producer for the theatre in 1900 and has been best known for his productions of *Very Good, Eddie*; *Oh, Boy!*; *Oh, Lady, Lady*; *Oh, My Dear*; *Chu Chin Chow*; *Mecca*.

COMSTOCK, HARRIET THERESA (1860–). An American author, born at Nichols, N. Y. She was educated at an academy in Plainfield, N. J. In 1885, she was married to Philip Comstock, of Brooklyn. Her books, mostly for children, had a very wide sale. They include:

Molly, the Drummer Boy (1900); *A Boy of a Thousand Years Ago* (1902); *Janet of the Dunes* (novel, 1908); *Joyce of the North Woods* (1911); *A Son of the Hills* (1913); *The Place Beyond the Winds* (1914); *The Vindication* (1917); *Mam'selle Jo: A Novel of the St. Lawrence Country* (1918); *Unbroken Lines* (1919); *The Shield of Silence* (1921); *At the Cross-roads* (1922); and many others.

CONCRETE. See CEMENT; ROADS AND PAVEMENTS

CONE, HUTCHINSON INGHAM (1871-). An American naval officer (see VOL. V). He commanded the United States Naval Aviation Forces from August, 1917, to October, 1918, and was wounded when his ship was sunk in the Irish Sea by a German submarine, in 1918. He received many foreign decorations and the Distinguished Service Medal of the United States Navy.

CONFLAGRATIONS. See FIRE PROTECTION.

CONGER, SEYMOUR BEACH (1876-). An American newspaper writer, born at Port Huron, Mich. He graduated from the University of Michigan in 1900, served on the staff of several papers in Michigan and from 1903 was connected with the Associated Press. He served this organization in St. Petersburg during the revolution of 1905 and the Russo-Japanese War. He was director of the Berlin bureau of the Associated Press from 1910 to 1917 and was war correspondent with the German and Austro-Hungarian forces until the United States entered the War. He represented the Associated Press at the Peace Conference at Paris. In 1918, he was foreign adviser to the War Trade Board in Washington, and following the War acted as chief correspondent of the *Public Ledger*, Philadelphia, in Central and Eastern Europe. During the Spanish-American War he served as private in the 32d Michigan Infantry.

CONGO, BELGIAN. A Belgian colony of Central Africa, with an estimated area, since 1919, of 928,000 square miles, and a native population estimated at 8,500,000 to 11,000,000. The white population on Jan. 1, 1922, numbered 9631; on Jan. 1, 1921, it was 8175, against 5465 in 1912. Of the population of 1921, 4706 were Belgians, 938 English, 303 Americans, 1047 Portuguese, and 351 Italians. The leading cities were Boma, the capital, Matadi, Banana, Leopoldville, Stanley Pool, and Elizabethville.

Industry and Trade. The rubber industry steadily dropped in importance. In 1921 only 786,436 kilos were exported as compared with 3,401,970 kilos in 1911. On the other hand, the palm-oil industry, exploited by British capital, made steady advances so that by 1921 the export of palm nuts was 45,876,469 kilos (5,573,630 in 1910), and of palm-oil, 8,970,173 kilos (1,963,637 in 1910). With the fall in rubber, attention was turned to the cultivation of cotton, cocoa, rice, and copal, whose export in 1911 amounted to 1,944,455 kilos. In 1921 this export amounted to 11,097,103 kilos. The development of the copper mines, too, increased enormously under the British penetration into Katanga. (See COPPER.) Furnaces were built for the smelting of the ore for shipment to the United Kingdom. In 1911, the shipment was about 909,090 kilos; by 1921 it had reached 30,464,000 kilos and in 1922, 43,362,000. Gold, diamonds, and ivory were other important products. Exports both general and special had been valued at 142,590,000 francs in 1912. Special exports

alone were worth 217,980,062 francs in 1921. Copper, palm-nuts, and oil were particularly important. Belgium, of course, absorbed most of the trade. Great Britain, United States, Rhodesia, Angola, France, were next in order. Leading imports were cotton, provisions, machinery, spirits, ships, and arms. Imports in 1913 were worth 71,590,781 francs; in 1920, 237,534,767; and in 1921, 276,027,218. In 1920, the countries of origin of imports in the order of value of goods, were Belgium, Great Britain, Union of South Africa, Rhodesia, the United States, and France. The United States imports were put at 10,844,247 francs, a tremendous increase over the 74,525 francs of 1913. By Jan. 1, 1921, the total length of railways had increased to 2663 miles. The most important project begun in 1921 was a line from Chilongo in the Katanga to Angola, 400 miles, to be linked eventually with the line to Lobito Bay on the Atlantic Ocean. This would give the Katanga mines direct connection with European markets. In 1911 a pipe line was laid from Matadi to Leopoldville for the purpose of transporting crude oil for the use of river steamers. In 1921 there were 2,085 miles of telegraph line, about twice as much as in 1912 (1145 miles), and 15 wireless stations (5 in 1912).

Finance. In 1922 receipts were 87,320,908 francs, against 40,418,100 for 1913; 1922 expenditures were 191,796,313 francs, against 50,933,064 for 1913. The public debt in 1919 was 349,847,446 francs, a gain of more than 100 per cent since 1912. Expenditures regularly exceeded receipts, with the result that the deficit steadily mounted and loans had to be made for its service. The estimates of the 1923 budget showed a deficit of 82,028,462 francs. In 1921 a loan of 500,000,000 francs was raised for an ambitious programme of public works.

History. Natives were employed in the fighting in East Africa and aided in the subjection of German East Africa. At the conclusion of the War, Belgium was given the districts of Ruanda and Urundi, formerly belonging to German East Africa, and the territory around Lake Kivu necessary to make it Belgian. All in all, 19,000 square miles were added to the Congo's territory. To facilitate the construction of the Cape to Cairo railway and more particularly a line from the Tanganyika Territory to Uganda, Belgium turned over to Great Britain portions of this new territory. The native population continued to express its dissatisfaction, from time to time, in revolts. In 1920 one of these manifestations took on a larger importance when the white civil servants went on strike.

CONGREGATIONALISM. Congregationalism traces its origin to both the Separatist and Puritan developments of the Reformation in England. Its polity represents adaptation to conditions rather than accord to a theory of church government. The local church is the unit and every church member has an equal voice in its conduct and is equally subject to its control. The membership increased from 750,193 in 1914 to 861,168 in 1923, and the number of Sunday school pupils from 701,460 to 780,375; but the number of churches declined from 6096 to 5716 and the number of ministers from 6066 to 5581. In October, 1923, the National Council, the representative body of the denomination, approved the proposals of the Interchurch Conference on Organic Union, that so soon as at least six denominations agreed, they

should merge under the name of the United Churches of Christ in America. The plan grew out of overtures made by the General Assembly of the Presbyterian Church in the United States of America in 1918 and was referred in 1921 to State conferences and district associations for action. The National Council in 1923 also expressed its willingness to confer with the Presbyterian Church with a view to immediate merger. A five year tercentenary campaign in celebration of the anniversary of the landing of the Pilgrim Fathers was carried on, 1915-20, one item of which was the subscribing of \$5,000,000 as an endowment of a pension system for ministers; a further movement was inaugurated to raise \$5,000,000 annually for missionary and educational purposes. Foreign missions were carried on throughout the period in 1600 centres under 14 flags, and home missions in 45 States and Territories of the United States. Nine theological seminaries and 40 colleges were affiliated with the denomination.

CONGREGATIONAL METHODISTS. This branch of the Methodist Church was organized in Georgia in 1872 as a protest against certain features of the episcopacy and the itinerancy, and for the purpose of securing a more democratic form of church government. By the figures issued by the Census bureau in 1916 there were 12,503 members of the denomination and 250 ministers; in 1924, according to a statement issued by an official of the church there were about 8497 members and 128 ministers.

CONGRESS POLAND. See POLAND.

CONKLING, GRACE WALCOTT HAZARD (?-). American author, born in New York City, educated at Smith College and abroad. In 1914, she went to Smith to teach English. Her collected volumes of verse included *Afternoons of April* (1915); *Wilderness Songs* (1920). In the period she attracted wide attention as the teacher of her little daughter, Hilda Conkling, whose *Poems by a Little Girl* (1920) displayed great ability.

CONNAUGHT, ARTHUR WILLIAM PATRICK ALBERT, DUKE OF (1850-). English statesman (see VOL. V). In 1916, he retired from his position as Governor-General of Canada, and in 1920 went to India to represent the King of England in the inauguration of the legislative councils of Madras, Bengal, and Bombay. His only son, Prince Arthur of Connaught, was appointed Governor-General of the Union of South Africa in 1920.

CONNECTICUT. Connecticut is the forty-sixth of the United States in size (4965 square miles) and the twenty-ninth in population; capital, Hartford. The total population of the State increased, during the decade 1914-24, from 1,114,756 in 1910 to 1,380,631 in 1920, a gain of 23.9 per cent. The white population increased from 1,098,897 to 1,358,732; Negro, from 15,174 to 21,046; native white, from 770,138 to 982,219; foreign-born white, from 328,759 to 376,513. The urban population rose from 731,797 in 1910 to 936,339 in 1920; the rural, from 382,959 to 444,292. The growth of the principal cities was New Haven (q.v.), 133,605 to 162,537; Bridgeport (q.v.), 102,054 to 143,555; Hartford (q.v.), 98,915 to 138,036.

Agriculture. While the population of the State increased 23.9 per cent in the decade 1910-20, the percentage of rural population declined from 40.1 in 1900 and 34.4 in 1910, to 32.2 in 1920. The total area in farms decreased

13.1 per cent, from 2,185,788 acres in 1910 to 1,898,980 in 1920; the number of farms, from 26,815 to 22,655, or 15.5 per cent, the improved land in farms, from 988,252 acres to 701,086, or 29.1 per cent. The total value of farm property, on the other hand, apparently increased from \$159,300,771 in 1910 to \$226,091,617 in 1920, the average value per farm, from \$5944 to \$10,019. In interpreting these and all other comparative values for the decade 1914-24, the inflation of currency in the latter part of the period is to be considered. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. The total percentage of land used for agricultural purposes in 1920 was 61.6 as compared with 70.9 in 1910; the percentage of improved land in farms decreased from 32 to 22.7. Of the 22,655 farmers of 1920, 14,955 were native white, as compared with 19,841 in 1910; foreign-born white, 7625, compared with 6861; colored, 75, as compared with 113. Of the total number of farms in 1920, 19,666 were operated by their owners, as compared with 23,234 in 1910; managers operated 1070 farms in 1920 and 949 in 1910; tenants operated 1919 farms in 1920, 2632 in 1910. Farms free from mortgage in 1920 numbered 9597, 13,080 in 1910. Those under mortgage numbered 8920, compared with 9958. The number of all cattle on farms in 1920 was 173,764; in 1910, 195,318. The number of sheep decreased to 10,842 from 22,418. Tobacco growing showed a large increase in the decade, in production 50 per cent and in acreage nearly 68 per cent. The estimated production of the chief farm crops of 1923 was as follows: corn, 3,355,000 bushels; oats, 335,000; potatoes, 2,662,000; hay, 436,000 tons; and tobacco, 48,165,000 pounds. Comparative figures for 1913 are corn, 2,348,000 bushels; oats, 308,000; potatoes, 2,208,000; hay, 432,000 tons; and tobacco, 28,520,000 pounds.

Mining. Connecticut is not an important mineral-producing State, and its mineral products in the decade were chiefly non-metallic. In order of importance, they were clay, stone, lime, sand and gravel. The value of the clay products, lumped with those of Rhode Island, was \$1,229,037 in 1914. In 1920 the value for Connecticut alone was \$3,255,295; and in 1921, \$1,703,528. The annual value of the stone production was approximately \$1,500,000. The total value of the mineral products of the State was \$3,023,192 in 1914; \$3,501,460 in 1918; \$6,326,326 in 1920, and \$4,219,457 in 1921.

Manufactures. Connecticut is one of the most important of the manufacturing States. In 1920, 18 of its cities had more than 10,000 inhabitants, with a combined population of 865,943, or 62.7 per cent of the population of the State. In 1919, 71 per cent of the value of the State's manufactured products was reported from these cities. The number of manufacturing establishments in 1909 was 4251; in 1914, 4104; and in 1919, 4872. Persons engaged in manufacture in those years numbered 233,871, 254,499, and 338,033, respectively. The capital invested in 1909 was \$517,546,554; in 1914, \$620,194,294, and in 1919, \$1,232,324,318. The value of the products rose from \$490,271,695 in 1909, to \$545,471,517 in 1914, and \$1,392,431,620 in 1919; but this increase was largely due to changes in industrial conditions brought about by the War, and cannot be properly used to measure the growth of manufactures during the

census period, 1914-19. The increase in the number of wage earners indicates a decided growth in the manufacturing activities of the State. Foundry and machine shop products rank first in their value, which in 1909 was \$65,535,000; in 1914, \$87,009,000, and in 1919, \$203,626,000. Industries relating to the manufacture of brass, bronze and copper products rank second, with products valued at \$66,933,000 in 1909; in 1914, \$69,353,000, and in 1919, \$169,550,000. In the manufacture of textiles Connecticut is one of the most important of the States; it ranks first in the fur felt hat industry, fourth in silk, sixth in manufactured cotton, and sixth in the combined woolen and worsted goods industry. The value of cotton goods product in 1909 was \$24,232,000; 1914, \$30,809,000; and 1919, \$105,054,000. The silk goods were valued at \$21,063,000 in 1909, \$30,592,000 in 1914; and \$68,053,000 in 1919. The value of the woolen products fell from \$19,363,228 in 1909 to \$17,128,975 in 1914; in 1919 it had risen to \$53,814,059. The most important manufacturing cities of the State are Bridgeport, Hartford, New Britain, New Haven, and Waterbury. Bridgeport had 367 establishments in 1909; 405 in 1914, and 443 in 1919, with products valued at \$65,609,000, \$85,126,000, and \$208,090,000 in those years. In Waterbury 169 establishments in 1909, 190 in 1914, and 253 in 1919, had products valued at \$50,350,000, \$50,659,000, and \$130,193,000, respectively. New Haven had 588 establishments in 1909, 538 in 1914, and 769 in 1919; producing a value of \$50,870,000, \$57,752,000, and \$125,456,000 in those respective years. In Hartford, which had 396 establishments in 1909, 380 in 1914, and 504 in 1919, the value of local products rose from \$40,680,000 in 1909 to \$42,831,000 in 1914, and to \$118,003,000 in 1919. New Britain counted 111 establishments in 1909, with a product valued at \$22,021,000, 1914, 120, with a product of \$23,227,000, and in 1919, 116, with a product of \$63,622,000. Other important manufacturing cities are Ansonia, Bristol, Danbury, Meriden, Middletown, New London, Norwalk, Torrington, Stamford, and Willimantic.

Education. Connecticut has always been one of the most progressive States in the development of its educational system. Legislation in 1913 provided for the codification of the school laws and for vocational guidance in schools. In 1917 an agreement was made with the Federal Board of Vocational Education, under the Smith-Hughes Act, for Federal assistance in vocational education. A measure passed in 1921 provided for a division of physical education and health; another bill created a division of special educational standards. Several important laws were passed by the Legislature of 1923. Provision was made for State aid for the transportation of elementary school pupils and for the penalizing of any town which unduly delays in providing adequate school facilities for children under 16. The department of Americanization, established in 1919, was changed to the Division of Adult Education. The registration in the public schools in 1913-14 was 211,975, with an average attendance of 168,060. In 1917-18, 243,870, with a 190,897 average, in 1921-22, 279,043 and 229,689. In the year mentioned last, registration in the elementary schools was 245,747, and in high schools, 33,182. The total expenditure for education in

1921-22 was \$20,800,637. The percentage of illiteracy in the State increased from 7.2 per cent in 1910 to 7.8 per cent in 1920, although among the population of native white parentage it decreased from 0.6 per cent in 1910 to 0.4 per cent in 1920, and among the Negroes, from 7.8 to 7.5 per cent. Among foreign-born whites it increased from 16 to 18.1 per cent.

Finance. For finance, see STATE FINANCES.

Political and Other Events. During the decade 1914-24, Connecticut remained Republican in politics, and few political events had national importance. In the elections of 1914, Marcus H. Holcomb, Republican, was elected governor, defeating Lyman T. Tingier. Senator Brandegee was reelected over Gov. Simeon E. Baldwin. Governor Holcomb was reelected in 1916, and George P. McLean was reelected senator. In the presidential election in 1916, Charles E. Hughes received 106,514 votes; President Wilson, 99,786 votes. In 1917 and the years following, the great industrial cities of the State were benefited by the activities following the entrance of the United States into the War. Manufactories were made over for war uses and additional factories were built. At the end of 1917 the State had about 9000 men in camp under the selective draft law and about 4000 volunteers. In 1918 Governor Holcomb was elected for a third term, together with the entire Republican State ticket. The total number of men drafted in the Federal service, 1917-18, was 23,533, with a total of 54,123 in the army and navy for the State. Ammunition factories and metal-working concerns continued prosperous during this year. In 1920 Everett J. Lake was elected governor, and Senator Brandegee was reelected. In the presidential voting of this year, Warren G. Harding received 229,238 votes and James M. Cox 120,721. In 1922 Charles A. Templeton, Republican, was elected governor, and Senator McLean was reelected to the Senate. Governor Templeton was inaugurated on Jan. 3, 1923. In his inaugural address he denounced the tendency to violate the prohibition law. He also proposed a commission to study and report on agricultural conditions with a view to their improvement.

Legislation. Sessions of the Legislature are held biennially. Among the more important matters acted on by the Legislature in the decade 1914-24 were the following. In 1915, the budget system was adopted and the State's financial policy revamped to provide a "pay-as-you-go" policy which virtually wiped out the State debt. In 1915, the woman suffrage amendment was rejected by the Legislature, but the State, after steadfastly opposing it, suddenly ratified in 1920 when doubt about Tennessee's ratification seemed likely to threaten the validity of the forthcoming presidential election, barely thirty-six States having ratified. The Legislature rejected the prohibition amendment in 1919. Demand for a soldiers' bonus resulted in the establishment of a \$2,500,000 State fund, the income from which is paid to an ex-service men's organization, for the aid of needy men who served in the War, or their dependents. In 1921, a child welfare bureau and a juvenile court system were established; a new motor vehicle law enacted, basing registration fees on piston displacement and putting a tax of \$0.1 a gallon on gasoline; a uniform system of accounting for all State departments and institutions set up, and persons accused of crimes given the right

to choose whether to be tried by the court instead of by jury. In 1923, the Legislature passed a bill to facilitate coöperative marketing of agricultural products and made provision for the creating of associations for this purpose; amendments were made to the income tax laws and a resolution passed by the Legislature for a constitutional amendment to allow the governor to veto single items in appropriation bills, subject to reconsideration by the Legislature if it is in session.

CONNELLEY, WILLIAM ELSEY (1855-). An American author (see VOL. V). His recent works include *History of Kansas* (5 vols., 1917), and *History of Kentucky* (5 vols., 1922).

CONNELLY, MARC (MARCUS COOK) (1890-). An American playwright born at McKeesport, Pa. He began his writing as a reporter for the *Pittsburgh Sun*. He has contributed verse and articles to *Life*, *Everybody's* and other magazines and has written lyrics for several musical comedies including: *Dulcy: To the Ladies*; *Little Old Millersville* (in collaboration with G. S. Kaufman, 1921-22); *The Beggar on Horseback* (with Kaufman, 1923), founded on P. Apel's *Hans Sonnenstossers Hollenfahrt*.

CONNOR, WILLIAM DURWARD (1874-). An American soldier, born at Beloit, Wis. He graduated from the United States Military Academy in 1897, and was appointed second lieutenant. He served in the Philippines campaign and during the Filipino Insurrection in 1898 and for several years following was engaged in engineering capacities, serving also with the General Staff from 1912 to 1916. In 1917, he served with the General Staff of the A E F as assistant chief of staff. He was appointed chief of staff of the 32d Division in 1918, and in the same year commanded the 63d Infantry Brigade of that division. In 1918-19, he was chief of staff of the Service of Supply, and was commanding general of the American forces in France to Jan. 7, 1919. In 1921, he was chief of the Transportation Service and in the same year acted as assistant chief of staff. He received decorations and honors from the British and French governments.

CONRAD, JOSEPH (1856-1924). An English novelist (See VOL. V). The following works by Conrad were published over the period surveyed: *Within the Tides* (1915); *Victory* (1915); *The Shadow-Line* (1917); *The Arrow of Gold* (1919); *Rescue* (1920); *Notes on Life and Letters* (1921); *The Rover* (1923). Early in 1924 he made a short visit to the United States. He died in August, 1924.

CONSCIOUSNESS AND THE UNCONSCIOUS. The conception of consciousness was revolutionized in the period 1914-24 by the action of two antithetical extremist movements. These movements were behaviorism and the new psychology centring around psychoanalysis and clinical investigations of abnormal psychology. The theoretical principles in the name of which they took the field against the old-fashioned structural psychology were diametrically opposed, but the new schools were at one in their dissatisfaction with experimental introspection as a method for dealing with the practical problems of psychology.

The systematic position of structural psychology was expressed in the doctrine of psycho-physical parallelism; this doctrine not only gave a certain theoretical clearness to the problems of psychology, but what is more important,

it lent itself to a vast experimental programme. Psychical phenomena were regarded not as in any sense caused by physical or physiological phenomena but as running parallel with the lower series. The hypothesis of parallelism dates back to the seventeenth century, when it was used as a metaphysical theory to explain the entire structure of the universe. In its modern form the hypothesis was less pretentious. It took psychological and physical experience at their common-sense face value and postulated as a method of investigation and comparison the non-interaction of the two series. In order to compare consciousness with physiology it was necessary to analyze its structure. This was done by the method of introspection; in opposition, that is, to the method of logical reflection under which philosophers down to Kant had decomposed the mind into abstract categories or faculties. The analysis of consciousness was carried on under experimentally controlled external conditions, and in this manner consciousness was first decomposed into sensations as elements, and when this theory proved untenable, into attributes as the fundamental units. These attributes, such as extensity, duration, clearness, quality and intensity, were aspects of conscious life corresponding to specific alterations of physical or physiological conditions. By the method of controlled introspection experimental psychology was designed to avoid the Scylla of the subjective faculty psychology and the Charybdis of materialistic mechanism. But in the view of its opponents structuralism sinned in both directions. In actual practice the theory of psycho-physical parallelism was held to approach more and more the doctrine known as epiphenomenalism, according to which consciousness was only a phosphorescence peculiar to the biological behavior of the neuron particles. Structuralism certainly failed to satisfy the common-sense belief in the efficacy of mind on the material world. On the other hand its preoccupation with defining mental life in terms of a logical system drew on it the wrath of those who were growing impatient at the failure of psychology to become a science like other sciences. Add to this the failure to deal adequately with perception and with the higher thought processes, and its rather uncertain stand in the case of instincts and the general substratum of our conscious life, and we are in a fair way to appreciate the significance of the revolt against structuralism as a psychological doctrine.

If one should employ a metaphor drawn from politics, the revolt of behaviorism might be characterized as a revolt from the left; that is, in the direction of more mechanical objectivity. The revolt of the psycho-analytic movement would then be a push from the right. Behaviorism (q.v.) developed out of the objective methods of animal psychology and biology and in theory sought to abolish consciousness as anything but a functional relation of physiological reflexes. It achieved thereby unity of method but only at the expense of ruthlessly exterminating the chiaroscuro of mental life. Behaviorism, whatever its significance in psychological experimentation, marked a return to the metaphysics of the man-machine with the addition of the notion of the conditioned reflex. It is this conditioned reflex, the phenomenon that we observe so frequently in gymnastic training, that is the unconscious saving grace of behav-

iorism, for willy-nilly it imports into the rigid materialistic mechanism the principle of contingency. Several attempts have been made to combine behaviorism with a realistic metaphysic for the evident purpose of eliminating consciousness as a directing principle in the universal drama. Typical of these are the works of E. B. Holt (*The Concept of Consciousness* and *The Freudian Wish*) and articles by Prof. R. B. Perry. On the other hand the English Neo-Realist, Prof. S. Alexander, while postulating a general monistic position, yet refuses to reduce the quality of consciousness to any of the lower levels of existence. To him, it is a quality over and above the nervous system in much the same manner that life is something beyond the physico-chemical reactions of the living plant or animal.

The line between the scientific aspects of the problem of consciousness and the radiating metaphysical speculations is always difficult to draw, and it is still more difficult to maintain in the concept of the unconscious. The importance of this notion has arisen from its growing use in clinical psychiatry, where it serves to explain and to link together facts which cannot be organized on the old hypothesis of parallelism. The unconscious might have remained merely a romantic idea dear to the metaphysicians of Schopenhauerian descent had not the French school and the psychoanalytic group developed it into a systematic theory of neuroses and psychoneuroses. It is in vain, therefore, that Knight Dunlap protested (*Mysticism, Freudianism and Scientific Psychology*) against the unscientific nature of the new movement. The theory of the unconscious is much less rigorous than the theories employed in the physiological branch of psychology, and it is moreover based on a different method of approach and different type of word symbols; hence arise problems of liaison between the so-called old and new psychology. But withal, the Freudian theory of the unconscious, despite its admitted lack of rigor and its tendency to degrade into extravagance, is preferable to a refusal to organize the phenomena of abnormal psychology at all.

In brief, what is postulated by the theory of the unconscious is a hierarchic continuity of psychic life extending indefinitely back into the history of the individual, the history of the race, and ultimately into the history of life itself. Whereas we ordinarily explain the sensations of consciousness by the presence of physical stimuli outside the body, the theory of the unconscious explains a great part of conscious phenomena, particularly those which are not explained by the first method, by past history. In dream life very little correlation can be traced between the mental phenomena and the physical stimuli affecting the person; much more interesting correlations can be obtained between the events of a dream and the past history, or even the future, of the individual. Even in normal consciousness, there appears to be much more in the mind than the stimulus which has given rise to the sensory experience, and the residue is generally explained on the basis of memory. The parallelistic hypothesis is unable to account for the impulse to action save by the intervention of a new mechanism, from which consciousness is excluded, the mechanism of reflexes, instincts, and habits. The theory of the unconscious is an effort to unify the three schemas of sensory perception, memory, and instinctive

response into a single chain. What we regard as full or clear consciousness is merely the end product of an historical evolution. As an end product it contains the cumulative story of the past, a story which can be recovered by the proper analytic method.

The method of analysis parallels the comparative method of biology in searching for vestigial traces. Obviously it cannot be mere external observation by the microscope and the scalpel, since that form of observation is insufficient to detect even the grosser biological evolution. The analysis has to be within consciousness, or within the lower levels of consciousness manifested in hypnosis or in dreams, and when this is insufficient, selected facts from the history of the individual are introduced. The event of breaking a leg is not generally of much importance to the subsequent morale of the individual, but a childhood fear, long since forgotten, may be the missing link which accounts for a present psychological condition. The daring genius of Freud has consisted very largely in seizing on certain facts as significant which to other observers seemed irrelevant. Prof. Pierre Janet in recent years elaborated a theory of various levels of psychological tension, according to which there are stable gradations of plateaus in the continuity from psychological automatism to the highest levels of reflective conscious activity. These levels are interestingly correlated with the physical metabolism of the organism. Thus the execution of a conscious and deliberate act was found to demand a greater expenditure of physical energy than the same act executed as a reflex. This theory serves also to make more understandable not only the phenomena of sleep and hypnosis but the fluctuations in the behavior of psychopathological cases.

Another ramification in the theory of the unconscious is the problem of multiple personalities. The clinical evidence on this subject shows all gradations from what might be regarded as metaphorical divisions of personality to genuine cleavages in conscious activity. Impressed by these phenomena, Dr. Morton Prince and Prof. William McDougall have fought for a recognition of pluralism. Professor McDougall's method of meeting the problem is through a revision of the Leibnitzian monadology. From the point of view of positive science, this problem, in reality the metaphysical problem of the one and the many, is quite irrelevant. Whether the individual be regarded as a distinct consciousness or as a collection of conscious instincts or monads, it is evident that here is no escape from the paradox of unity and diversity. In cases of multiple personality, it is the type of unity and the type of diversity which differ from those to be found in a normal conscious personality with multiple interests. The relation of consciousness and the unconscious to the instincts or hereditary tendencies is equally a problem of the one and the many. Freudian psychologists often identify the unconscious with the sex instinct, and at other times they speak of the sex instinct as an instinct among other instincts. At other times they split the unconscious into two warring entities. These ambiguities are practically unavoidable in the attempt to give dialectic movement to the life of the psyche. The physical instinct of sex, because it is in the generality of men the strongest of the discreet physical urges as well as the most mysterious, has very fre-

quently been employed as a symbol for the entire drive of life. Plato's Eros is an instance in point. But the symbol qua symbol of an underlying reality cannot be confounded with the symbol qua independent entity. The whole theory of sublimation hinges on the distinction between symbol and reality; for it is not sex, regarded as a discreet instinct, that is sublimated into intellectual or artistic activity; it is rather the *elan vital* expressed in the sex instinct which has found new channels. Yet from a phenomenological view it would seem as if there were a real conversion or substitution.

From the foregoing discussion it is evident that the representative theory of consciousness, according to which the mind carried a point-to-point image of a physical reality, must now be regarded as obsolete. If our psychological life is made up of images, then our physical experience too is made up of images or symbols. The latter symbols or images are more stable and conventional than the so-called fainter images of the subjective consciousness, but they are not different in kind. If consciousness be regarded as the phenomenon of knowledge or intelligible awareness, it follows that we never escape that phenomenon in all human experience. But if consciousness be employed in another sense to denote the subjective level of experience, then the phenomena of consciousness form a distinct subject matter of science, a subject matter paralleling biology but not reducible to it. And this science has now been organized by means of the unconscious as a concept of continuity. The unconscious must not be hypostasized into an entity, for like the concept of an imaginary number in mathematics it makes trouble when it is set up against concrete physical experience, although it remains perfectly intelligible in its scientific setting.

It is useful for many purposes to correlate one level of experience with another, and in this respect there will always be room for a science of physiological psychology which uses the method of controlled introspection. This science is analogous to the sciences of biochemistry (q.v.) and biophysics, but like the latter it can only make correlations and cannot reduce the facts of one level to those of a lower level. Under the view here exposed there is justification for all the prevailing methods of investigating the phenomena of consciousness, but the justification cannot be extended to the metaphysics which is consciously or subconsciously brought in with each method. Thus behaviorism as a metaphysic means materialistic monism, but this extrapolation of the doctrine is not at all necessary to the positive method of charting individual behavior and thereby predicting conduct. The same principle applies to structuralism and the psychoanalytic methods of investigating consciousness. Whatever conflict arises exists between rival metaphysical dogmas and not in the positive intellectual organization of facts.

CONSTANT, FRANK HENRY (1869-). An American engineer, born at Cincinnati,

Ohio, on July 25, 1869. He was graduated in 1891 at the University of Cincinnati, and at once entered upon the practice of his profession, as assistant engineer of the King Bridge Company. In 1893-95, he was with the Osborn Engineering Company. In 1895, he became assistant professor of structural engineering at the University of Minnesota and two years later was made full professor. In 1914, he was called to the chair of civil engineering and made head of the department at Princeton. The degree of Sc.D. was conferred on him by Cincinnati in 1915 and by Lafayette in the same year.

CONSTANTINE I, KING OF GREECE (1868-1923). (see VOL. V.) His connection with the German Imperial family (his wife was the sister of the former German Emperor) and his known sympathies for German methods generally, prompted him to maintain Greek neutrality in the War. The ensuing struggle between him and Venizelos, who was disposed toward an alliance with the Allies, in large part makes up the history of Greece in the eventful years 1914-17. The occupation of Saloniki by an Allied army, the formation of a Venizelist "Provisional government," the capture of Athens by English and French contingents, all combined to seal Constantine's fate. He yielded to the Allied demand and on June 11, 1917, relinquished his throne in favor of his second son Alexander. To December, 1920, he lived in exile. The death of his son and the overthrow of Venizelos in the election of November, 1920, resulted in his triumphal reentry into his capital, and it was largely to rehabilitate his fortunes that he embarked on the Anatolian adventure (June, 1921). The disastrous defeat that his armies suffered in the Græco-Turkish War (1921-22) and the consistent refusal of the Allies to support or recognize his aspirations again combined to bring him low. He was forced to abdicate a second time, Sept. 27, 1922, and took refuge at Palermo. Here he died, Jan. 11, 1923. He was succeeded on the throne by his son, George II, who, in turn, on Dec. 18, 1923, was compelled to leave the country. On Apr. 13, 1924 the Greek people expressed themselves as overwhelmingly in favor of a republic. See GREECE, *History*.

CONVOY. See WAR IN EUROPE.

CONWAY, SIR (WILLIAM) MARTIN (1856-). An English art critic (see VOL. VI). He became trustee of the Wallace Collection (1916), director general of the Imperial War Museum (1917), and president of the Kent Archaeological Society (1923). His recent books include *The Sport of Collecting* (1914); *The Crowd in Peace and War* (1915); *The Abbey of St. Denis* (1916); *Mountain Memories* (1920), and *The Van Eycks and Their Followers* (1921).

COOK, GEORGE CRAM (1873-1924). An American author, born at Davenport, Ia., and educated at the universities of Iowa, Harvard,

Heidelberg and Geneva. In 1895-99, he taught in the University of Iowa and for a short time in Leland Stanford Jr. University. In 1911, he became associate literary editor of the *Chicago Evening Post*, and in 1915 director of the Provincetown Players. His works include: *In Hampton Roads* (1899), *Roderick Taliaferro, a Story of Maximilian's Empire* (1903); *Evolution and the Superman* (1906); *The Chasm* (1911); *Battle-Hymn of the Workers* (1912); *The C T U.* (1914); *Suppressed Desires* (1920; first written as a play in 1915); and *The Spring* (1921; produced as a play and published).

COOK, PHILIP (1875-). An American Protestant Episcopal Bishop of Delaware, born at Kansas City, Mo. He was graduated at Trinity College in 1898 and from the General Theological Seminary in 1902. He was ordained to the priesthood of the Protestant Episcopal Church in 1902, and after serving as a missionary in North Dakota for two years, became vicar of the Chapel of the Incarnation in New York City. In 1911, he was called to other pastorates, going to Baltimore in 1916, where he remained until 1920, when he was elected Bishop of Delaware and was consecrated on October 14 of that year. He was a delegate to the General Conventions of the Protestant Episcopal Church in 1913 and 1919. During the War, he served in France with the 77th Division of the American Expeditionary Forces as Y. M. C. A. secretary.

COOKE, MARJORIE BENTON (?-1920). An American author, born at Richmond, Ind. She began writing for magazines at an early age, and won success for her monologues, which she delivered throughout the country after 1902. Three one-act plays by her were produced on the stage. *Bambi*, a novel produced in 1914, had an immediate and remarkable success. She also wrote: *Modern Monologues* (1903); *Dramatic Episodes* (1905); *Plays for Children* (1905); *The Girl Who Lived in the Woods* (1910); *Dr David* (1911); *The Dual Alliance* (1915); *Cinderella Jane* (1917); *The Threshold* (1918); *The Clutch of Circumstance* (1918); *The Cricket* (1919); *Marrried?* (1921). She died in 1920 while in Japan on a world tour.

COOKE, MORRIS LLEWELLYN (1872-). An American engineer, born at Carlisle, Pa. After having served as a reporter on various Philadelphia, Denver, and New York newspapers he was graduated from Lehigh University (M.E., 1895). He practiced his profession with various corporations until 1905, after which he devoted himself to consulting practice until 1911. Then, for four years, he was director of the Department of Public Works in Philadelphia. During the Spanish-American War he served in the United States Navy as assistant engineer, and during the recent War he was in Washington engaged as chairman of the storage system of the War Industries Board of the Council of National Defense (1917) and as assistant to the chairman of the United States Shipping Board (1918). He frequently lectured on scientific management and municipal administration, and is the author of *Academic and Industrial Efficiency* (1910), *Snapping Cords* (1915), and *Our Cities Awake* (1918).

COOK ISLANDS. See PACIFIC OCEAN ISLANDS.

COOLEY, MORTIMER ELWYN (1855-). An American engineer (see VOL. VI). He was elected president of the Federated American En-

gineering Societies in 1921, and was also an officer in a number of scientific societies.

COOLIDGE, ARCHIBALD CARY (1866-). An American university professor (see VOL. VI). In 1918, he was sent as special agent of the State Department to Sweden and Northern Russia. The following year he was chief of the mission attached to the Peace Conference which spent five months in Vienna and three months in Paris. In 1921, he became a member of the American Relief Administration in Russia. He is author of *The Origins of the Triple Alliance* (1917), and translator of the English edition of *Secret Treaties of Austria-Hungary*, 1879-1914, by Alfred Francis Pribram (2 vols., 1920-21).

COOLIDGE, CALVIN (1872-). A President of the United States, born at Plymouth, Vt. He graduated at Amherst College, Mass., and practiced law at Northampton, Mass. He held various local offices and served in the Massachusetts State Senate (1912-15). He was lieutenant-governor of Massachusetts (1916-18) and governor (1919-20). He first became nationally known through his intervention in the Boston police strike of 1919, when his prompt action in calling out the State troops prevented serious trouble and ended the strike. He was hailed throughout the nation as a strong champion of law and order, and his selection as candidate for the vice-presidency was felt to add greatly to the chances of Republican success at the polls. At the convention he was nominated by acclamation. When President Harding died on Aug. 2, 1923, Calvin Coolidge became president, taking the oath of office on August 3. He announced that he would follow in general the policies of his predecessor. Toward the end of the year 1923, the so-called "oil scandals" caused him much embarrassment. The criticisms launched against Attorney-General Daugherty and Secretary of the Navy Denby finally forced their resignations from the cabinet and relieved the situation somewhat. But Congress proved more and more independent of his leadership by passing the bonus bill over his veto, changing the Mellon tax bill, and refusing to accede to his request in regard to postponing the operation of the Japanese exclusion part of the immigration bill. He was nominated at the Republican National Convention in June, 1924, as candidate for the presidency to succeed himself. *The Price of Freedom*, a collection of his speeches, was published in 1924.

COOPER, COLIN CAMPBELL (1856-). An American artist (see VOL. VI). He won a gold medal for oil painting and a silver medal for water color at the Panama Pacific International Exposition (1915) as well as other prizes in 1918 and 1919. One of his best recent pictures was "Broadway in War Time" in the Pennsylvania Academy of Fine Arts.

COOPER, DEAN THOMAS POE (1881-). An American agriculturist, born at Pekin, Ill. From 1902 to 1907, he was statistical agent of the Minnesota Experiment Station and special agent of the Bureau of Statistics, United States Department of Agriculture. He graduated from the University of Minnesota in 1908 and until 1911 was assistant in farm management and agricultural economist at that university. From 1914 to 1917, he was director of the North Dakota Experiment Station and in 1918 became dean and director of the Agricultural College of the University of Kentucky. He was a member

of several scientific societies and wrote on farm management and agricultural economics.

COOPER, IRVING STEIGER (1882-). An American bishop of the Old Catholic Church, and theosophist, born at Santa Barbara, Cal., and educated at the University of California and at Madras, India. He was consecrated regionary bishop for the Liberal Catholic Church in 1919. He published the following works: *Methods of Psychic Development* (1911); *Ways to Perfect Health* (1912); *The Secret of Happiness* (1912); *Theosophy Simplified* (1915); *Reincarnation, the Hope of the World* (1917).

COOPER, JAMES (1846-). A British theologian (see Vol. VI). In 1916, and again in 1921, he was president of the Scottish Logical Society, an office which he had held at various times previously. He was Moderator of the General Assembly of the Church of Scotland in 1917. In 1922, he retired from his professorship in church history at the University of Glasgow, an office which he had held since 1899. His later works include: *Our Sacred Heritage* (closing address as Moderator, 1917), and *Reunion, a Voice from Scotland* (1918).

COOPER, LANE (1875-). An American university professor (see Vol. VI). He was acting associate professor during the summer term of 1914 at the University of Illinois. The following year he became full professor of English language and literature at Cornell University, and was professor elect at Smith College. He was acting professor during the summer quarter at Stanford University in 1918, and at the University of California the following year. Among his later works are: *Methods and Aims in the Study of Literature* (1915, 1921); *A Concordance to the Works of Horace* (1916); *Louis Agassiz as a Teacher* (1917); *The Greek Genius and its Influence* (1917); *George Meredith, an Essay on Comedy* (1918), and *Two Views of Education, with Other Papers* (1922).

COÖPERATION. The decade 1914-24 witnessed a growth in all forms of coöperation. This development was not equal in all countries; consumers' coöperation was still most important in England; coöperative credit was outstanding in Germany and India; producers' coöperation was most manifest in Holland and Denmark. In the United States which had never been friendly soil for the coöperative movement, significant tendencies toward coöperative effort appeared.

Credit Unions in the United States. Alphonse Desjardins was responsible for the passing of the first general law in North America which authorized the organization of coöperative credit associations. This was in 1906. His plan was a combination of the Luzzati system of Italy and the German Raiffeisen plan of coöperative credit. Many French Canadians who had become acquainted with the operation of credit societies in Canada emigrated to the factory towns in New England. The first coöperative credit association in the United States was established in Manchester, N. H., by Desjardins at the end of 1908. Almost all the members were French. In 1924, it was still operating under a special charter granted by the Legislature in 1909. Massachusetts, however, was the first State to consider the possibilities of coöperative credit seriously. Desjardins was invited to describe the working of the credit associations of Quebec before the Twentieth Century Club of Boston; and in 1909, Massachusetts

passed an act similar to the Quebec act. The first society opened was the Myrick Credit Union of Springfield, which began its work in May, 1910. Literature was published and scattered broadcast to explain the advantages of coöperative credit associations. The cause was advanced by addresses delivered before the Ohio Bankers' Association in 1910 and before the American Bankers' Association in 1912. In 1913 the First National Conference on Marketing and Foreign Credits met in Chicago. From that time on, the agitation for legislation authorizing the establishment of credit societies was more pronounced, and after 86 different bills had been submitted by members of Congress, the Farm Loan Bill was finally passed, July 17, 1916. This bill was not entirely coöperative in its nature, but was a combination of coöperation and Federal aid. During this time 19 States passed laws which permitted the States to lend money to the farmers and provided for rural savings banks. The characteristics of credit associations differ somewhat in the various States, but the main principles are common to the majority.

1. In Massachusetts, New Hampshire, New York, Rhode Island, Florida, North Carolina, the associations are called credit unions, in Wisconsin and Nebraska they are called coöperative credit associations.

2. The control is usually exercised by the banking department of the State. North Carolina is an exception.

3. The number of members necessary to form a union as authorized by the different States ranges from 5 in Rhode Island to 15 in Nebraska.

4. The par value of each share is low so that any person of good character may become a member. The range of share values is from \$5 in New Hampshire, South Carolina and Utah to \$25 in Texas, New York, North Carolina and Oregon.

5. Only members may receive loans from the credit unions, and most States provide a limit to the amount that may be borrowed by one individual. Some States do not permit loans greater than \$50.

6. Most credit unions operate on the limited liability plan, although it is possible for them to adopt the unlimited liability plan current in Germany, if their by-laws permit.

7. Credit unions may receive deposits from members in all States, and in Utah, North Carolina and South Carolina from non-members.

Massachusetts had 81 credit unions in 1921 with 32,226 members and a share capital paid in during the year over \$1,000,000. More than 12,000 members borrowed a total of \$3,000,000 from the unions. \$83,000 was paid as dividends. New York had 68 credit unions at the end of 1920, with 22,490 members, about one-third of whom were women. These unions lent \$4,511,000 during 1920. There was an increase each year in the number of unions formed. North Carolina had 22 credit unions in 1921, with 1000 members, and during that year lent \$84,000 to 290 borrowers.

The success of the credit unions must not be judged by the number of unions. The most important aim of the States in encouraging the formation of coöperative unions was to furnish relief to farmers. This object had not been fully attained. North Carolina had the most conspicuous success in meeting the demand for rural credit. The reasons were obvious. The

unions should not have been under the control and protection of the State banking departments, since these departments seemed to rest content with assuring themselves that the unions fulfilled the requirements of the law for banks, while European experience had definitely proved that coöperative rural credit required encouragement and direction. North Carolina was able to provide this service. Coöperative credit is a form of self-help which should be divorced from financial aid. If the poor farmers of South Germany and the indigent ryots of India could, by combination, meet their own needs, it seemed that the farmers of America should be able to do as well. It is a fundamental principle of Raiffeisenism that governments should not furnish financial assistance but only supervision and sympathetic direction. See AGRICULTURAL CREDIT.

Consumers' Coöperation in the United States. The latest official report for the United States, from the United States Bureau of Labor Statistics Bulletin 313 (1920), stated that there were 2600 unions in the United States. Perhaps 50 per cent were operated on strict coöperative principles. Consumers' coöperation was reported to be particularly strong among the Finns and the coal miners of Illinois and Pennsylvania. The bulletin referred to reports that 650 consumers' societies sold \$65,000,000 worth of goods. There seemed no reason to suppose that there would be any rapid development of consumers' coöperation in the United States.

Producers' Coöperation in the United States. While this form of coöperation made great progress in the United States during and immediately after the War, its exact growth could not be gauged because of the overlapping of consumers' and producers' coöperation. For example, rural societies often purchase coöperatively and market collectively their own output. In 1920, the latest year for which figures were available, the Bureau of Labor Statistics reported that the United States had 63,351 members of such associations with a paid-in share capital of 11,079,945. See COTTON and AGRICULTURE.

Coöperation in Other Countries. Outside of the United States were reported over 60,000 coöperative societies with a membership of more than 25,000,000. The Coöperative Union of the United Kingdom comprised 1472 societies in 1921, 91 per cent of them consumers' societies. There were 102 producers' and 3 wholesale associations. The total membership of the union was 4,598,737, of which number 3,838,000 were members of consumers' societies in England and Wales and 662,885 in Scotland. The coöperative wholesale societies had become very prosperous, owning their own fleet of vessels and more than 29,000 acres of tea plantations in Ceylon and India. The National Federation of Consumers' Societies of France had 1,360,000 members. Besides this group there were reported to be as many societies which were not affiliated, and also a considerable number of coöperative credit societies, some organized according to the Luzzatti system and many more on the Raiffeisen plan. The Federation of Coöperative Societies of Belgium had over 231,000 members. There were also several people's banks organized on the Schulze system. There had been a partial change from unlimited to limited liability. This system differs from that of Germany in having no central bank. India made great prog-

ress in the development of coöperative credit. In many districts the power of the money lenders over the poor farmers was broken. Latest reports showed 42,000 agricultural credit societies with 1,400,000 members. The 1921 data from official sources in Russia showed 1082 consumers' unions and 7500 agricultural and over 6000 industrial societies. The All Russian Central Union of Consumers' Societies, comprising 98 federations and representing a membership of 6,000,000, had a wholesale trading organization, and published a daily and a weekly paper.

COOVER, JOHN EDGAR (1872-). An American psychologist born at Remington, Ind. He was educated at the Colorado State Normal School and Leland Stanford Jr. University. After 1910, he was a member of the psychology department of the last named institution, becoming full professor in 1921. He is the author of *Investigation with a Trumpet Medium* (American Society for Psychical Research, 1915), *Formal Discipline from the Standpoint of Experimental Psychology* (1916), and *Experiments in Psychical Research* (1917). He is also the contributor of a number of articles on psychology, psychical research, education, and statistical methods, published in professional journals.

COPEAU, JACQUES (?-). A French actor-manager and director of the Théâtre Vieux Colombier. He is a reformer in the theatre, and of the various theatrical experiments in Paris, his seem to be the only ones which have resulted in a completely modern self-dependent institution established on a basis of stability and organized so that all resources may be directed toward an idealistic aim. He has successfully waged war against decrepit tradition but he has kept traditions which are still full of life and richness. The classics, for the most part, form his repertory. Among his performances are: Dostoevsky's *The Brothers Karamazov*, a very moving production; *Twelfth Night*, one of the plays most frequently presented; and André Gide's *Saul*, one of his most important theatrical achievements of recent years. In 1919, the Vieux Colombier came to New York City, and he took the part of Washington in Percy Mackaye's *Washington*.

COPELAND, ROYAL S (AMUEL) (1868-). Physician and ophthalmologist, and United States Senator from New York. Born in Dexter, Mich., he received his M.D. from the University of Michigan, 1889, and in 1905 was made ophthalmologist to his alma mater. He moved to New York in 1908 to occupy the same chair and assume the deanship of the New York Homoeopathic Medical College and Flower Hospital. He began his political career as mayor of Ann Arbor in 1901-03 and was president of the local Board of Education in 1907-08. In 1918, he became Commissioner of Public Health and president of the Board of Health, New York City, resigning in 1923 to assume the duties of senator. In 1906, in collaboration (Copeland and Ibershoff) he published the work *Refraction*.

COPPER. The War naturally had an important effect on the production of copper as this metal was required in large quantities for muni-

tions. The world's production in 1913 was 2,181,253,000 pounds, but with the stimulation of the War it began to increase, reaching a maximum of 3,150,552,000 pounds in 1918, when almost 2,000,000,000 pounds were produced in the United States alone. From this time, however, the production dwindled until 1921 when but 1,234,576,000 pounds were produced of which 505,586,008 pounds were the output of smelters in the United States. This was considerably less than the annual production for the period of 1916-17-18, but in 1922 the output was larger amounting to 1,851,864,000 pounds, while in 1923 the United States alone had a smelter

WORLD PRODUCTION OF COPPER

(In Pounds)

1913	2,181,253,000
1914	2,054,090,000

production from domestic ores of 1,434,999,962 pounds. For the World's production in pounds for the years 1913-22 see next column.

Naturally with the extensive use of copper for cartridge cases and other munitions of war the outbreak of hostilities in 1914 stimulated activity in the copper industry, especially in

metal mounted, and in the United States there was great activity both in the mining and in the refining and manufacture of copper. The British government at this time considered shipments of copper to neutral countries contraband, on the ground that it was destined for the Central Powers. Accordingly some 45,000,000

pounds of copper were thus seized. On the other hand the Allies were large consumers of American copper.

By March, 1917, a maximum price of 37 cents a pound was secured in the United States, and when the American government entered the War it received adequate supplies of copper from the producers, though the question of price was deferred. On September 6th the War Industries Board of the United States bought about 77,000 pounds of copper for the Allies which advanced the price, but finally a price of 23½ cents was fixed by agreement between the War Industries Board and the copper producers. There were strikes in Montana and Arizona at this time which curtailed production, but these were adjusted and during the War copper in adequate amount was forthcoming.

With the great demand due to the War, production of copper by the United States was carried on at an extraordinary rate. Naturally with the termination of hostilities there was no further call for this metal for munitions, and at the beginning of 1919 the copper producers held some 839,510,000 pounds of unsold metal. In addition the allied governments at the same time held over a billion pounds of virgin copper bought for war purposes but not required after the Armistice. Furthermore there was twice that amount of scrap copper and held copper accumulated by various war manufacturing plants. Such conditions naturally had their effect on the industry which was slow in adjusting itself.

However, conditions improved very slowly through 1921, and during 1922 the world's surplus stock of copper was being slowly absorbed. At the end of 1922 secondary copper stocks were so far reduced that they ceased to be considered as a menace to the industry, and new production was entered into on a much larger scale. Copper mining in 1922 in the United States employed approximately 100,000 men. The industry during the year improved as in connection with the refining of copper; gold and silver were also recovered.

During 1923 the smelter production of primary copper from domestic sources in the United States amounted to 1,434,999,962 pounds, an increase of approximately 51 per cent over 1922. The value of smelter production increased approximately 64 per cent in 1923 over 1922, this increase in value being mainly due to the high prices prevailing during the first quarter of the year, for at the end of the year prices were at a lower level than the average for 1922. The average price of 2,404,768,102 pounds of copper delivered during the year, as reported to the Geological Survey by selling agencies, was 14.71 cents a pound, as against 13.5 cents in 1922. Smelter production of copper in Arizona increased from 428,200,624 pounds in 1922 to 615,493,561 pounds in 1923; in Montana from 165,341,414 pounds to 224,353,764 pounds; and in Utah from 79,665,563 pounds to 210,118,291 pounds. Most of the large companies in 1923 and 1924 were maintaining production at a rate somewhat below capacity, which they stated was because they did not wish to reduce their reserves at prices which do not yield an adequate return. In 1922-23 the Calumet & Hecla, the Ahmeek, the Allouez, the Centennial, and the Osceola companies formed the Calumet & Hecla Consolidated Copper Co., and the Kennecott Copper Corporation absorbed the Utah Copper Co.

Domestic production of new refined copper

from domestic and foreign sources, in 1923 was at a higher rate than that maintained during any previous year, except the abnormal years of 1916, 1917, and 1918. Domestic consumption also kept pace with production and except for the years mentioned was also at the highest rate, but because of unfavorable conditions in Europe, which had retarded consumption in the important consuming countries there, and the increased production in South America and Africa, which tended to increase competition in European and other markets, stocks by 1924 had increased, and prices were below what the producers had confidently expected they would be. The American producers sought to offset the low selling price of copper, so far as they were able, by decreased costs of production. These decreases were obtained by increased efficiency of operation, by improved labor, by consolidation of mining companies, and by closer cooperation between producers and manufacturers.

COPPER PRODUCED IN THE UNITED STATES
FROM DOMESTIC ORES, 1923
(Smelter output, in pounds fine)

State	1923
Alaska	68,648,368
Arizona	615,493,561
California	27,042,835
Colorado	4,343,418
Georgia	..

Tennessee	18,721,932
Texas	4,216
Utah	210,118,291
Washington	839,254
Wyoming	87,686
Undistributed	390,734
Total	1,434,999,962

In the above table the production is apportioned to the States in which the copper was mined. The figures represent the content of fine copper in the blister produced, the smelter output of ingot, and anode copper from Michigan.

It was realized that additional uses for copper could be developed with advantage to producers and manufacturers, and in 1921 the Copper and Brass Research Association was organized to promote a more general knowledge of the availability of copper for various purposes. This body made a survey of dwelling house construction and found that in this field alone 150,000,000 pounds of copper were used, and more would be required with the resumption of active building construction. Accordingly a campaign was put under way to increase the use of copper in this field.

In the period under consideration there had been heavy investments of American capital in South America in copper properties, particularly in Chile where the mines at Chuquicamata, Raicagua and elsewhere were receiving the attention of well organized and financed companies.

Likewise an important development with a considerable bearing on the copper situation of the world was the opening and exploitation of the copper deposits in the Katanga region of the Belgian Congo Free State owned by the Union Minière du Haut Katanga, said to be the largest in the world. This was a Belgian

STATISTICS OF THE COPPER INDUSTRY IN THE UNITED STATES IN 1922 AND 1923
U. S. GEOLOGICAL SURVEY

Summary of features of the copper industry in the United States in 1922 and 1923

Production of copper	1922	1923
Smelter output pounds	950,285,947	1,434,999,962
Mine production do	964,583,894	(a)
Refinery production of new copper		
Electrolytic do	766,944,836	1,302,454,492
Like do	122,545,126	137,691,306
Casting and pig do	15,180,723	24,019,197
Total domestic do	904,670,685	1,464,164,905
Total domestic and foreign do	1,255,515,959	1,979,835,616
Total new and old copper do	1,927,000,000	2,802,000,000
Ore produced		
Copper ore short tons	26,898,247	(a)
Average yield of copper per cent	1.74	(a)
Other ore yielding copper short tons	52,370	(a)
Average price per pound cents	13.5	14.7
Imports (un-manufactured) pounds	541,013,320	676,473,331
Exports of metallic copper ^b do	742,755,957	828,854,827
Withdrawn from total supply on domestic accounts:		
Total new copper pounds	896,633,833	1,300,473,331
Total new and old copper do	1,568,000,000	2,122,000,000
Stocks of refined copper ^c do	216,000,000	264,000,000
Stocks of blister and materials in solution ^c	861,000,000	432,000,000
Value of production in the United States	\$128,289,000	\$210,945,000
World's production pounds	1,851,864,000	(a)

^a Figures not available when table was compiled.

^b Total exports of copper, exclusive of ore, concentrates, and composition metal, and for 1923, unrefined material which can not be separated from ore and concentrates.

^c At the end of the year.

company in which the Tanganyika Concessions, a British corporation, owned a 39 per cent interest. With its mines, local smelters and refineries the Union Company was the largest copper producer in the world in 1921, with an output of 67,012,000 pounds, which was exceeded in 1922 when the production was estimated at 92,400,000 pounds. The official estimate of the ore reserves at the 12 great mines of the eastern group of the Union Minière was 2,800,000 tons of copper contained in 6-per cent ore aggregating some 49,000,000 tons. The other group of mines under development by this corporation was said to include 1,700,000 tons of metal in 8- to 9-per cent ore.

Large refining and reducing works have been erected in proximity to the mines, and hydroelectric power from the Lufira and Lualaba rivers was to be installed, inasmuch as other copper deposits have been found in Katanga, as well as elsewhere in Africa, the advent of which into the world's copper production was an important factor.

The rapid development of the copper industry in the Belgian Congo by 1923 had reached a point where the production amounted to some 57,000 metric tons as compared with 43,362 tons in 1922. The leading copper mines under operation were the Star of the Congo, Kambove, Likasi

and Luishia. The Star of the Congo had been exhausted three times, but in 1922 large reserves of ore were found. A smelter at Lumumbashi handled the ore and concentrates, some of which were prepared at the mines. There were reverberatory furnaces and electrocathodes were produced. The copper was sent to Europe by way of Beira ordinarily, but in 1923 some went out by Dar-es-Salaam, as the cost of transportation was slightly less. Half of the black copper produced in the Belgian Congo was shipped to America for refining, while the rest was treated in Europe, but there was under construction an electrolytic refinery to handle this ore near Antwerp.

CORAL REEF FORMATION. See GEOL. OGX.

CORBIN, JOHN (1870-). An American dramatic critic and author (see Vol. VI). He wrote *The Edge* (1915) and until 1916 was secretary of the Drama Society of New York. From 1917 to 1919, he was dramatic critic of the *New York Times* and after 1919 editorial writer for the same paper. He produced Shakespeare's *Tempest* (with full text in the Elizabethan manner) in 1916, and in 1922 published *The Return of the Middle Class*.

CORELLI, MARIE (1864-1924). An English novelist (see Vol. VI). Her later publications

include: *Innocent, Her Fancy and His Fact* (1914, 1921); *The Young Diana* (1917); *My Little Bit, a Record of War Work* (1919); *The Love of Long Ago* (1920); *The Secret Power* (1921), and *The Treasure of Heaven: a Romance of Riches* (1921).

COREY, WILLIAM ELLIS (1866-). An American capitalist, born in Braddock, Pa. He was educated in the public schools and at Duff's College, Pittsburgh. He entered the Edgar Thompson Steel Works at the age of 16, and became superintendent of the plate mill at the Homestead Steel Works in 1899. He succeeded Charles M. Schwab as general superintendent at these works in 1897. From 1901 to 1903, he was president of the Carnegie Steel Company, and from that year to 1911 was president of the United States Steel Corporation. In the latter year he resigned this post to become chairman of the board of the Midvale Steel and Ordnance Company. He was a director and official in many important financial institutions.

CORFU GOVERNMENT. See SERBIA.

CORFU INCIDENT. See ALBANIA; GREECE; ITALY.

CORN. According to the census of 1920, corn was produced on three-fourths of the farms in the United States. The average annual production of the country for the years 1914-23, inclusive, was 2,883,000,000 bushels. The average annual production of the leading corn states for the same period was as follows: Iowa 402,000,000 bushels, Illinois 320,000,000 bushels, and Nebraska 205,000,000 bushels. The average acre yield in the United States increased from 24.1 bushels for the ten-year period 1890-99 to 26.1 bushels for the ten-year period 1910-19. It was estimated that 40 per cent of the corn crop was fed to swine on farms, 20 per cent to horses on farms, 15 per cent to cattle on farms, and 10 per cent was used for human food. About 4,000,000 acres of corn each year were made into silage, over 2,500,000 acres were cut for fodder and more than 2,000,000 acres were pastured off with hogs. About four years after the War, corn production in southeastern Europe had practically regained its pre-war status. The corn area of Russia in 1923 was 3,548,000 acres, as compared with 2,223,000 acres in 1913. Largely as a result of the War, corn production in Argentina was increased to a considerable extent, although the yield in 1923 was below the average for the years 1909-13, which was 174,502,000 bushels.

The average annual total value of the corn crop of the United States for the five-year period 1910-14 was \$1,577,000,000, but the higher price of corn from 1916 to 1919 raised the value for that period to \$3,024,000,000. The 1920 crop was the largest ever harvested, but prices were receding and its total value was only \$2,150,000,000, while in 1921, with a yield only 4 per cent under the crop of 1920, prices had dropped so low that the total value was only \$1,303,000,000, or only 43 per cent of the annual value during the war period and about 16 per cent less than the pre-war value although the crop was 10 per cent larger than the pre-war average. During the war the average farm price of corn rose above \$1.00 per bushel; but the price began to decline in 1920 and reached the low point at the end of 1921, reducing the purchasing power of corn far below that of any other year. A marked

rise in the cost of production occurred from 1914 to 1920, and the rise in price was even greater and more rapid. The cost of production was far from declining in the same proportion as the price of corn, and this was one of the principal factors leading to the agricultural economic crisis beginning in 1920 and continuing for several years.

The United States Grain Standards Act of Aug. 11, 1916, required that in all interstate buying and selling of corn the grades used shall be the Federal grades established by the Secretary of Agriculture. According to these grades, based on condition and quality, the best corn is graded Number One and corn lower in quality is given numerical grades down to and including Number Six, while a "sample grade" is added for corn too low in quality for the numbered grades. To the insect pests attacking the corn crop in the United States was added the European corn borer. This insect, first reported within the United States near Boston in 1917, became established during the following six years in eastern New York and in a narrow strip along the shores of Lake Erie in New York, Pennsylvania and Ohio. By that time the insect infested, in Ontario, Canada, an area extending from Lake Erie northward and equal to the area infested in the United States. Quarantine regulations were put in force to prevent its spread and Congress appropriated money for its control. The diseases of corn which have become troublesome in recent years are the brown spot disease, characterized by brown spots usually on the leaf, the leaf sheath and the stalk, and root rot of corn which results in the partial or total decay of the root system causing the plant to lodge, and which attacks also the stalk and the ear.

Corn Oil. Corn oil, derived largely from the germ in the corn kernel and produced economically only in connection with the manufacture of corn products from which the germ is excluded, is of growing importance. Formerly used mainly in the manufacture of soaps and paints, it is now refined and used for food in the form of lard and butter substitutes, salad and cooking oils, shortening, and other similar substances. With the increase in the manufacture of corn products during the War, due in part to flour substitute regulations, the annual production of corn oil rose to 118,000,000 pounds but later receded to about 90,000,000 pounds. Corn oil is used also in making rubber substitutes. Corn cobs are utilized in paper-making, the production of adhesives, the manufacture of fibre board and wall board, and for other similar purposes. In some of the manufacturing processes employed, furfural, a compound used for technical purposes and also as a germicide and fungicide, is recovered as a by-product. Consult *United States Department of Agriculture Yearbook*, 1921. See AGRICULTURE.

CORN BORER, EUROPEAN. See ENTOMOLOGY, ECONOMIC.

CORNELL, KATHARINE (?-). An American actress who made her first appearance in 1916 with the Washington Square Players in *Bushido* and remained with that company some time, playing *The Death of Tintagiles*, *Plots and Playwrights*, etc. In 1918, she was with the Jessie Bonstelle stock company at Buffalo and subsequently toured in *Cheating Cheaters* and *The Man Who Came Back*. In 1919, she played Jo in *Little Women* in London and the next year toured in *The Man Outside*. One of

her best characterizations in New York was the part of Eileen Baxter-Jones in *Nice People* (1921).

CORNELL UNIVERSITY. A nonsectarian, coeducational institution at Ithaca, N. Y., established in 1865. The university's annual income available for current expenses increased during the decade between 1914 and 1923-24 from \$3,000,000 to \$4,500,000. Besides augmented income from invested funds, somewhat higher tuition fees, and increased State appropriation for the State College of Agriculture and Veterinary College, this increment included some \$100,000 given annually by alumni, \$100,000 from rents of new residential halls, and \$200,000 from the United States for research and extension instruction in agriculture. A campaign for new endowment, begun in 1919, yielded subscriptions of more than \$6,000,000, mainly for increased salaries for faculty members. The enrollment of students in 1923-24 was 5153, as compared with 5015 in 1914, and the faculty numbered 949, an increase of 199 over 1914. The number of volumes in the library was multiplied by almost one-half. The Baker Laboratory of Chemistry, for which George F. Baker gave \$1,500,000, and a \$400,000 State building for the department of dairy industry, were completed in 1923. Gifts received within the decade were \$500,000 from August Heckscher to endow research, \$50,000 from Mrs. Sarah Manning Sage for medical research, and an anonymous gift of \$200,000 for pediatrics. The library received from Charles W. Wason a collection relating to China, with a \$50,000 endowment. Col. Oliver H. Payne's bequest of \$450,000 to endow the medical college, which is situated in New York City, became available in 1914. The New York State Drill Hall was completed in 1917 and was used during the War by an army school of military aeronautics. Livingston Farrand succeeded Jacob Gould Schurman as president in 1921.

CORPS. See **ARMIES AND ARMY ORGANIZATION.**

CORTISSOZ, ROYAL (?-). An American journalist, born in New York City. For many years he was literary and art editor of the *New York Tribune*, and was a frequent contributor to magazines on art subjects and also lectured much on art. He was the author of *Augustus St. Gaudens* (1907); *John LaFarge* (1911), and *Art and Common Sense* (1913). He edited many classics, including *Don Quixote* and *The Autobiography of Benvenuto Cellini*. He also edited Whitelaw Reid's *American and English Studies*. He was a member of the National Institute of Arts and Letters.

COSGRAVE, WILLIAM THOMAS (1880-). An Irish statesman, born at Dublin. He was educated at the Christian Brothers' Schools, and, engaging in business in Dublin, amassed a fortune. He was a member of the secret revolutionary organization called the Irish Republican Brotherhood. In 1909, he was elected to the Dublin City Council. He was a leader in the Sinn Féin ranks, and on May 5, 1916, he was arrested, brought to trial, and sentenced to death. His sentence was changed to imprisonment for life, but he was released in the general amnesty of 1917. In the fall of 1917, he was elected to Parliament, but because of his Sinn Féin principles, did not take his seat. In May, 1918, he was again arrested and taken to England. He returned in 1919, was again arrested and deported. Upon his return to Dublin this

last time, he became minister of local government in the Dail Eireann. In January, 1922, he put through a plan to spend £1,000,000 on housing within the year. On the death of Arthur Griffith and of Michael Collins, Cosgrave became head of the Provisional Government. The constitution of the Free State was ratified, and in December, 1922, the Provisional Government came to an end. Timothy M. Healy became the first governor-general of the Irish Free State, and Cosgrave was elected president of the Executive Council. He also became Minister of Finance.

COSMOGONY. See **ASTRONOMY.**

COSTA RICA. A Central American republic situated between Nicaragua and Panama. Its area, variously estimated at 18,691 to 23,000 square miles, seated in 1922 an estimated population of 576,581 (population in 1911, 388,266). Immigration in 1920 was 6040 (1911, 9537) and the emigration, 5280 (1911, 8170). The populations of the largest cities, as estimated in 1920, were: San José, with suburbs, 51,395; Cartago, 17,402; Heredia, 13,885; Alajuela, 11,908; Limón, 10,231.

Industry and Finance. Agriculture continued to prosper. The coffee planters in 1922 had the best year in the history of their industry. In 1913, exports totaled 13,019,059 kilos, at a value of \$3,605,930; in 1922, 18,616,803 kilos, at \$6,677,762. Exports for 1923 and 1924 were large and commanded excellent prices. The 1924 crop was very good. In 1913, Great Britain took 82 per cent of the total; the United States, 6 per cent. During the War the United States displaced Great Britain from her commanding position, only to be compelled to yield up first place once more in 1922, when she bought 34 per cent, and Great Britain, 59. The sugar industry showed great advances. In 1913, production was 2,869,429 kilos with only an insignificant amount exported. In 1920, the export was 5,107,251 kilos, and in 1922, 2,608,678 kilos. Production in 1923-24 was placed at 19,000,000 pounds. The banana industry, worked for the most part by the United Fruit Company, ranked second in importance in point of export value. In 1912, the number of bunches shipped was 10,647,702; in 1922, 7,671,619, (with a value of \$5,003,455). Production was decreased somewhat in 1923 by blight. Cacao production assumed economic importance during the decade. Exports in 1913 were 845,931 pounds; in 1922, 7,236,378. Mining, on the other hand, decreased because of the exhaustion of the known ore bodies. Exports of gold and silver bullion for 1905-14 were worth an annual average of \$706,457; in 1922, \$491,188. Commerce over the whole period showed imports of \$8,687,280 for 1913; for 1922, \$8,344,670; exports for 1913 and 1922, \$10,234,149 and \$14,224,332. In 1912, 46 per cent of the imports came from the United States; in 1922, 61 per cent. Exports to the United States increased from 55 per cent to 56 per cent in 1922. They had reached 68 per cent in 1921. Government accounts fluctuated over the period. The year 1922 was the first to show a surplus since 1912. Expenditures in 1913 were 10,184,261 colones; in 1922, 17,311,165 colones. Revenues for the same years were 9,612,533 and 18,971,023 colones. Largely as a result of the deficits, the internal debt increased from 3,829,783 to 40,050,901 colones. The external debt increased in the same period from \$7,869,295 to \$13,635,852. The par value of the colon

is \$0.465 (2 15 colones to the dollar). In 1922 the colon was worth 4 4 to the dollar, so that the government was compelled to fix the legal rate of exchange, in October, 1922, at 4 colones. During 1923 there was a fluctuation in value, the colon going as high as 4 54 to the dollar, but the exceptionally good coffee crop and high prices of 1924 increased the gold exchange and made possible the regulation of the rate at 4 colones again.

History. President Alfredo González, elected in 1914, was confronted by serious disturbances in 1917 on his attempt to inaugurate a radical financial programme and was compelled to relinquish his office. His successor, Federico Tinoco, leader of the revolutionists, was refused the recognition of the United States, with the result that his waning influence ended with his overthrow in 1919 at the hands of Julio Acosta García. The latter served as president, 1920-24, and during his administration the country regained the stability for which it had formerly been celebrated in Spanish America. Under a small and satisfied land-owning class, prosperity prevailed. In 1917 Costa Rica severed relations with Germany and in 1918 assumed the rôle of an Associate Power on the side of the Allies. In 1920 the suffrage was extended to women. In 1921 the administration was thwarted in its attempt to join the newly-formed Central American Union by the negative vote of the National Assembly. (See CENTRAL AMERICAN UNION). In 1923 Secretary of State Hughes announced that it was the intention of the United States to recognize Costa Rica's rights in the use of the San Juan River for the Nicaraguan Canal route. The question had arisen out of Costa Rica's protest against the Bryan-Chamorro treaty of 1916 and her subsequent suit before the Central American Court of Justice, on the ground that the route, in being run through the San Juan River, alienated her territorial rights. For the presidential term 1924-28 Ricardo Jiménez was elected in May, 1924.

COST OF LIVING IN THE UNITED STATES. The cost of living index numbers given by the United States Bureau of Labor Statistics show the changes in the cost of living throughout the United States during 1914-24 in comparison with the average cost in 1913. Retail prices of food are secured directly from 15 to 25 dealers in each of 51 cities, and prices are also secured for coal, wood, gas, electricity, and kerosene from dealers in a number of cities. Other data on retail prices are secured by special agents. Rental figures are for 400 to 2000 houses and apartments in each city, according to its population. The costs of clothing, furniture, and miscellaneous items are determined from four quotations from each city on each of a large number of items; in Greater New York five quotations were secured instead of four. In the calculation of the index number the prices for the different articles of food are weighted according to the relative values shown in the budgets of over 12,000 families secured by the United States Bureau of Labor Statistics in its investigation during 1918-19. The different types of expenditure are weighted according to their relative values in total expenditure, as shown also in this budget investigation, but prices within the budget divisions are not weighted except for food. The following weights are used for the different budget divisions in the calculation of the cost-of-living index num-

ber for the United States: food, 38.2; clothing, 16.6; housing, 13.4; fuel and light, 5.3; furniture and furnishings 5.1; and miscellaneous, 21.3.

As shown by the figures given above, there were marked differences in the rate of increase, in 1913-24, in the six budget divisions. Food costs increased rapidly and also decreased rapidly; food costs after May, 1921, were nearer the cost level of 1913 than any of the other budget divisions. The cost of housing increased but slowly and was still showing a tendency to increase, and the cost of house and furnishing goods was also rising during the latter few years, after a rapid decrease from its peak in 1920. The cost of clothing remained well above the level of 1913, as did also the cost of fuel and light and the cost of miscellaneous items. The total cost of living shows amounts of change quite different from those indicated by any of the budget divisions separately.

In addition to the cost-of-living index number for the United States, the Bureau of Labor Statistics publishes data on the change in the cost of living in 32 cities. In 19 of these cities comparison is made with prices prevailing in December, 1914; in 13, with prices prevailing in December, 1917. Each of these index numbers is weighted according to the proportionate expenditure for the different budget divisions shown by the budgets collected in the city during the 1918-19 investigation. The food expenditure, however, is weighted according to the average expenditure shown in all budgets collected in the geographical division in which the city is located, rather than according to that shown in the budgets secured in the particular city. As will be seen by reference to the accompanying table, there is considerable variation among the cities in the amount of change in the total cost of living, variation being partly from differences in weights and partly from differences in retail prices. In all instances, however, living costs increased slowly at first, and then more rapidly until the highest point was reached in June, 1920. The decrease was fairly rapid until March, 1922, and since then there has been a tendency in some instances toward a slight decrease and in others toward a slight increase. Monthly prices for 43 articles of food are secured by the Bureau in 51 cities and are published at quarterly intervals in the *Monthly Labor Review*, separately for each article in each city, and also combined to show the change in the cost of food for a family, the same system of weighting being used as in the calculation of the cost-of-living index numbers. There is also quarterly publication of retail prices of coal, gas, and electricity, and until November, 1923, of retail prices of dry goods. Other index numbers of the cost of living are those of the National Industrial Conference Board and the Massachusetts Commission on the Necessaries of Life, the first based on data on prices from all sections of the United States and the second on price data secured in Massachusetts.

Two interesting index numbers for the period 1909-19 were prepared by the National Bureau of Economic Research in connection with the study of income in the United States (*Income in the United States: Its Amount and Distribution, 1909-1919*, vol. ii). It was felt that an index number of the cost of living based on the goods and proportionate expenditure of families with small incomes might not measure accurate-

° November, 1919

ly the change in the cost of living of families with larger incomes, and special indexes were prepared based on the goods and proportionate expenditure estimated for families spending \$5000 and \$25,000 per annum on consumption goods. In both cases the increase in the cost of living was less marked during the latter part of the period than that shown by the index number of the cost of living of families with smaller incomes. Quantity budgets descriptive of the living standard of families at different economic levels have been used in a number of instances in determining wage rates for different classes of employees under local living conditions and also in making changes in wage rates in accordance with changes in local prices. Such quantity budgets have been published by the United States Bureau of Labor Statistics for the family of a government employee in Washington, D. C., and also for the family of a workingman; the level is described as one of "health and decency." The Philadelphia Bureau of Municipal Research prepared a very detailed estimate of the expenditures required for the maintenance of a fair standard of living among city employees and has issued periodic statements of the amount necessary for the maintenance of this standard at current prices in Philadelphia.

Quantity budgets at higher economic levels were issued in 1923 by the California State Civil Service Commission. In these, the estimated expenditures of families of executives and of clerical workers were given in great detail as well as the estimated expenditures of the families of laborers. Quantity budgets for the lower economic levels have been prepared in a number of places by social agencies as the basis for relief grants to dependent families. Budgets for women workers have been used frequently by Minimum Wage Commissions as the basis for the establishment of minimum wage rates. Two types of problems seem to need solution in connection with the measurement of the cost of living. It is necessary to know the amount of change in the cost of living because of changes in the price level, it being assumed that the standards of expenditure have remained relatively unchanged. It is also necessary to know the cost of maintaining a specified living standard under given conditions of living costs. The first type of problem is being solved by the availability of index numbers which measure the change in the living cost in many localities in the United States. The second type of problem is being solved by the use of quantity budgets. Along both lines much progress has been made in the United States. See WAGES.

COTTON, MANUFACTURES OF. See TEXTILE MANUFACTURING.

COTTON. The cotton situation of the world. in 1924 was unsatisfactory from almost every standpoint. As a result of recent investigations new industrial uses for cotton have been developed and the quantity required for automobile tires, artificial leather, pyroxylin, which has many uses, etc., is very large. This new demand, coupled with diminishing world supplies of cotton, has made it difficult if not impossible for spinners and weavers to keep their spindles and looms fully employed. On the other hand, the growers of cotton in many countries have been hard put to produce their crop at a profit on account of insects, diseases, unfavorable climatic, soil, and labor conditions, and in some cases, lack of adequate transportation. The

maximum world's production of cotton was attained in 1914 when a crop of 24,800,000 bales of 500 pounds each was marketed. Of this total, 15,934,000 bales, or nearly 65 per cent, was produced in the United States. In 1923 the estimated world's production of commercial cotton was 17,600,000 bales, of which 10,160,000 bales, or 58 per cent, was grown in the United States. Following the year 1920 there was a surplus of commercial cotton for a few crops and there was a large carry-over, but reduced production and growing demand had so drawn upon the reserve that in 1924 there was every prospect of a deficient supply. This was shown in the greatly depressed condition in the spinning centers of many countries.

Boll Weevil. In the United States the reduced production was due to a number of causes, the principal of which is the boll weevil, *Anthonomus grandis*. The boll weevil, which is a native of Central America and Mexico, made its appearance near Brownsville, Tex., about 1892. It advanced toward the north and east at an average rate of about 100 miles a year until in 1923 practically all the old cotton belt from Texas and Oklahoma to North Carolina was infested. So severe were its ravages that the production of upland cotton was greatly curtailed and the crop of Sea Island cotton was reduced from a maximum of 119,000 bales in 1911 to less than 1000 bales in 1923. The presence of the boll weevil necessitated the adoption of modified methods of growing the crop that materially increased its cost. Early maturing varieties are more extensively grown, and heavy applications of fertilizers are recommended to hasten the maturity of the crop. Poisoning the weevils with calcium arsenate has been extensively adopted and more than 1,000,000 pounds of this material were employed in 1923. Where the land is sufficiently fertile to produce at least half a bale to the acre the use of calcium arsenate has proved very profitable. By the combination of these methods it has been found entirely practicable to grow cotton in regions of heavy boll weevil infestation. See ENTOMOLOGY, ECONOMIC.

Distribution of Production. There was a very considerable extension of the cotton area of the United States between 1914 and 1924. Arizona and California became important producers of cotton, with a production in 1923 of more than 132,000 bales. In Arizona, the industry was largely built up around strains of Egyptian cotton, and in 1920 the production of Egyptian-American cotton was in excess of 100,000 bales. This cotton is of a special type, having very long and fine lint, and it is suited to special manufactures. The overproduction in 1920 resulted in a fall in price and a reduced planting of these varieties. In 1923 only about 22,000 bales of this type of cotton were grown, while there was a decided increase of short staple cotton both in Arizona and in California.

In Egypt, one of the great cotton producing countries, there was a steady decline in the yield of cotton per acre, and although there was a large area brought under cultivation by the construction of the great Assuan Dam, the total production of cotton showed little increase. Several commissions studied the situation and the reduced production per acre was attributed to various causes, among them changed cultural methods, rise of water table due to overirrigation, extensive planting of varieties of low pro-

duction but yielding fine lint, and the spread of pests, especially the pink bollworm.

For many years Great Britain has been the greatest consumer of cotton, about 35 per cent of all the spindles devoted to cotton spinning being in that kingdom. In order to make English spinners less dependent upon the United States for supplies of cotton, an active campaign was started to increase the growing of cotton within the British Empire. In 1902 there was organized the British Cotton Growing Association. In 1919 the Empire Cotton Growing Corporation was chartered and it is supported by contributions from the government and by a tax of 6d. per bale on all cotton imported into and spun in the United Kingdom. Through the activities of these organizations the growing of cotton has been stimulated in many parts of the British Empire. In some countries subsidies have been granted to growers, gins have been erected, experiment stations and seed farms established, and irrigation works constructed, all with a view to increasing cotton production. While no large amounts of cotton were added to the world's production, the possibilities of successful cotton growing in some countries seemed assured. Parts of Africa, particularly the Sudan, Uganda and Nigeria, were considered very promising. In Australia the climate and soils appeared favorable, and it was believed a profitable industry could be built up. Efforts were being made to improve the cotton situation in India, and a fund derived from a tax of 2 annas (about \$.08) a bale on all cotton grown in the country was devoted to research in the cotton industry. Brazil had a 1923 crop estimated at 660,000 bales. An international commission visited Brazil in 1922 and reported favorably on the possibilities for cotton growing and suggested means whereby production might be greatly increased.

Although active efforts were made by European agencies to increase the production of cotton in order that there might be larger supplies for the old spinning centres, there has been a rapid expansion of spinning in new territories and it is considered doubtful whether the desired object will be attained. Japan, reporting nearly 5,000,000 spindles in 1922, became an important consumer of raw cotton. In Brazil, as cotton production has increased, manufacturing it into yarn and cloth has grown. India is consuming more of its crop in domestic manufactures and the exports are not increasing very appreciably.

In February, 1924, there were in the United States 37,742,000 spindles, an increase of about 15 per cent since 1914, indicating a material increase in cotton consumption within the country. There was a decided movement of cotton spinning toward the cotton growing States, and while there were still about 2,000,000 spindles more in the northern than in the southern States, the number of active spindles and spindle hours per month in the cotton growing States were greater in the South in February, 1924. See TEXTILE MANUFACTURING.

Coöperative Marketing. An important development in cotton marketing in the United States took place soon after 1920. Coöperative marketing was established on an extensive scale through state-wide agencies, associations having been organized in Texas, Oklahoma, Georgia, North Carolina and South Carolina. These were federated into a Cotton Growers' Coöperative Association. In 1922 about 700,-

000 bales were marketed coöperatively, and of the crop of 1923 it is claimed that more than 1,500,000 bales were so handled. A selling organization known as the American Cotton Growers' Exchange was established in 1923. In connection with the Cotton Standard Act of March 4, 1923, the United States Department of Agriculture has established standards for American cotton that have become widely adopted, and on Aug. 1, 1924, they became the universal standards for grade and color. See AGRICULTURE: and the articles on individual States which lie in the Cotton Belt.

COTTON, HENRY ANDREWS (1869-). An American psychiatrist widely known in connection with the relief of certain forms of insanity through surgical intervention. Born in Norfolk, Va., he graduated at the Baltimore Polytechnic Institute in 1894 and took his medical degree at the University of Maryland in 1899. He studied psychiatry in Europe during 1905-07, being active in the laboratories of Professors Kraepelin and Alzheimer, at Munich. Upon his return he was placed at the head of the New Jersey State Insane Asylum. In 1921, he delivered a course of lectures at Princeton on the relation of focal infection to insanity. His views and experience are set down in his book *The Defective, Delinquent and Insane* (1921).

COTTON, JOSEPH POTTER (1875-). An American lawyer, born at Newport, R. I. He graduated from Harvard in 1896 and from the Harvard Law School in 1900. After 1915, he served as counsel to the New York Commission on Workmen's Compensations, and was consulting counsel of the Federal Reserve Board and of the United States Shipping Board. He was chief of the meat division, United States Food Administration, in December, 1917, and in the following year was European representative of the Federal Food Administration. He was also a member of the Inter-Allied Finance Council. He edited *Constitutional Decisions of John Marshall* (1906).

COTTON BOLL WEEVIL. See ENTOMOLOGY, ECONOMIC.

COTTRELL, FREDERICK GARDNER (1877-). An American chemist (see VOL VI). During 1920-21, he was director of the United States Bureau of Mines, and also chairman of the Division of Chemistry and Chemical Technology of the National Research Council. He was also a member of many important chemical and engineering societies.

COTTRELL PROCESS. The Cottrell process for precipitating fine particles of solid matter in smoke, gases, and furnace fumes was very widely applied in American metallurgical plants. Not only does it greatly reduce smoke and fumes exhausted from chimneys, but in some cases it recovers material of very great value, as in metal smelters. The process consists of passing the fumes between two conductors maintained at a unidirectional difference of potential of from 50,000 to 100,000 volts. For this purpose high potential alternating voltages are rectified by means of a mechanical rectifier or more recently by means of a hot cathode two-electrode vacuum tube known as a kenotron.

COUÉ ÉMILE (1857-1926). A French psychologist, born at Troyes, France. At 19, he became an apprentice in a pharmacy, and at the end of three years, went to Paris and took his Ph.D. in Pharmacy, helping to pay his way by

winning a competition for government fellowship of 1200 francs a year. Later, a druggist at Troyes offered him a partnership. This druggist soon died, leaving the store to his young partner. Coué married the daughter of a wealthy horticulturist of Nancy. He became a hypnotist, then an autosuggestionist. Later he had a sanitarium where he practiced without charge to his patients. After a somewhat sensational career in France and England, he came to the United States early in 1923 and held many clinics in New York City and throughout the country. Coué's theory was that the subconscious mind may be trained to direct the diseased organ to do the thing that will make it better. The subconscious mind was trained by repeating many times each day: "Every day in every way I am getting better and better." A National Coué Institute was organized under the auspices of Col. A. Woods, Mrs. W. K. Vanderbilt, and others.

COULTER, JOHN LEE (1881-). An American statistician (see VOL. VI). During 1917 and 1918, he was a member of the West Virginia State Council of Defense, also expert for the National Exports Council, and of the War Industries Board. He was with the Army Overseas Educational Commission during 1918 and 1919.

COUNCIL OF FIVE. See PEACE CONFERENCE AND TREATIES.

COUNCIL OF NATIONAL DEFENSE. See UNITED STATES, *History*.

COUNCIL OF TEN. See PEACE CONFERENCE AND TREATIES.

COUNTY, ALBERT JOHN (1871-). An American railway official, born in Dublin, Ireland. He entered the railway service with the Great Southern and Western Railway of Ireland, in 1885. Removing to the United States, he became clerk in the secretary's department of the Pennsylvania Railroad, and in the years following served in various important capacities with that road and with its subsidiary lines. In 1916, he was appointed vice-president in charge of accounting and corporate work of the Pennsylvania and affiliated roads and was also director and president of most of the branch and affiliated lines of the Pennsylvania Railroad Company. He was also an official and director in many important financial institutions and was a member of many learned societies.

COUPERUS, LOUIS (1863-1923). A Dutch novelist, born at The Hague, where he was educated. His youth was spent in Batavia, Greece, Italy, and the south of France. His publications began to make an impression in foreign countries as early as 1891, when *The Footsteps of Fate* was published in England. His first venture was a volume of verse, *Een Lent van Vaerzen* (1884). After the publication of *Orchideeën* (1887), he wrote only fiction. Many of his later works show the influence of his Italian experience, and indicate a lighter view of life. The first to be rendered into English by the official translator of his works, Alexander Teixeira de Mattos, was a short love story entitled *Ecstasy* (1891), which appeared in the United States in 1910. This was followed by English versions of *Majesty*; *Universal Peace*; *Psyche*; *Fidessa*; *Babel*; *God and the Gods*; and a series of four novels entitled "Books of the Small Souls," namely, *Small Souls*; *The Later Life*; *The Twilight of the Souls*; and *Dr. Adriaan*, which reached a wide public in the United

States. He also published at intervals historical novels which reflected his researches in the Greek and the Italian past, including *The Mountain Light*, a study of the emperor Heliogabalus, and *The Comedians* (*De Komodianten*, 1906), which deals with two young actors in the reign of Domitian. These were held back by the translator as unsuitable for an English version. Another, *The Tour*, of which the scene is laid in Egypt in the reign of Tiberius, was published in the United States in 1920. His other historical romances are *Abu-Abdallah the Unfortunate*, *The Flying Chessboard*, and *Ierxes or Pride*. He also wrote two mythological romances, *Dionysus* and *Heracles*, which were being translated in 1923. Meanwhile he wrote another story of modern life called *Old People and the Things that Pass*, issued in the United States in 1919. In addition, he published volumes of travelers' impressions, sketches, short stories, and a number of novels whose scenes are laid in the Dutch East Indies. He died at Amsterdam, July 16, 1923.

COURLAND. See BALTIC PROVINCES; LITHUANIA; LATVIA.

COURTENAY, WILLIAM (1875-). An American actor born at Worcester, Mass., who attracted notice first as a member of the late Richard Mansfield's company. He played in various places in the United States and made his most notable recent successes in: *Under Fire* (1915); *Pals First* (1917); *General Post* (1917); *The Maid of the Mountains* (1918); *Cappy Ricks* (1919); *Civilian Clothes* (1920); *Honors Are Even* (1921).

COURT OF INDUSTRIAL RELATIONS. See LABOR ARBITRATION; KANSAS.

COURT TENNIS. See TENNIS.

COUSE, E. IRVING (1866-). An American painter (see VOL. VI) whose specialty is the portrayal of Indian life. He recently won many prizes for his Indian paintings including a silver medal from the Panama Pacific International Exposition (1915), the Altman prize from the National Academy of Design (1916), Isidor prize from the Salmagundi Club (1917), the Ranger Fund Purchase Prize from the National Academy of Design (1921), and the Lippincott prize from the Pennsylvania Academy of Fine Arts (1921).

COVENEX, CHARLES CARDEN (1874-). An American architect born in Boston. He received his professional training in an architect's office and during travel in Europe. His principal architectural achievements are the Christian Science Church and the Burrage residence in Boston, the Memorial Church in Fairhaven, Mass., and the Messiah Home in New York.

COWL, JANE (?-). An American actress, born in Boston. She began her stage career as an extra girl, one of her early small parts being in *The Music Master*. She had her first big leading rôle in David Belasco's production, *Is Matrimony a Failure*, and then she played stock. This was followed by *The Gamblers*, her first great success, and by *Within the Law*, *Common Clay*, and other successes. She turned her attention to playwriting also, and wrote *Daybreak* with Jane Murfin, then *Lilao Time and Information, Please*. Her most notable triumph has been Juliet, in *Romeo and Juliet*, which she played in 1923 and 1924. She began to study this rôle when she was 13, and her interpretation of her part was given great praise. During the 1923-24 season she ap-

peared also in *Pelléas and Mélisande* and in *Antony and Cleopatra*.

COWLING, DONALD JOHN (1880-). An American university professor and college president, born at Trevalga, Cornwall, England. He was brought to America by his parents in 1882 and was educated at Lebanon Valley College, Yale and Baker Universities. He received the honorary LL.D. degree from Knox, Williams and Oberlin Colleges. After teaching philosophy at Baker University, he became, in 1909, president of Carleton College. Dr. Cowling was a leader in religious education, and was trustee of the Congregational Foundation for Education and of the Chicago Theological Seminary. In 1918, he was president of the Association of American Colleges and in 1919, served on the American Council on Education.

COWS. See DAIRYING, LIVE STOCK, VETERINARY MEDICINE.

COX, HAROLD (1859-). An English editor and economist (see VOL. VI). He was a member of the Bryce Commission on German Outrages in 1915, a member of the Committee on Public Retrenchment (1916), and of the Royal Commission on Decimal Currency (1919). He published *Economic Liberty* in 1920.

COX, JAMES M. (1870-). An American politician (see VOL. VI). He was Governor of Ohio for the terms 1913-15, 1917-19, and 1919-21. In 1920, he was Democratic nominee for President of the United States, but was defeated by the Republican candidate.

COX, SIR PERCY ZACHARIAH (1864-). A British High Commissioner of Iraq (Mesopotamia). He was educated at Harrow and Sandhurst. After a few years in the British army he was appointed to the Indian political department, and acted as consul on the Somali Coast, at Berbera, in Arabia, and on the Persian Gulf. In 1914, he was secretary of the foreign department of the Government of India, and acting British minister to Persia from 1919 to 1920. His administration of Iraq as high commissioner (1920-23) covered the transition from military rule through a provisional government to the time when Feisal, a son of the King of the Hejaz, was made king by the British in 1921. He had considerable trouble with cabinet crises which arose because of objections to the acceptance of the British mandate.

COXE, WILLIAM GRISCOM (1869-). An American marine engineer, born in Reading, Pa. He received his engineering education in Germany and for several years was with a marine construction company in Scotland. He acted as foreign representative and assistant general superintendent for the Cramp Shipbuilding Company from 1898 to 1904, and built for them several large battleships for Russia and other countries. He was president and official in many shipbuilding and engineering corporations. During the Spanish-American War he served as lieutenant in the United States Navy and from 1917 to 1920 was district manager of the Emergency Fleet Corporation, Delaware River District. He was president of the Atlantic Coast Shipbuilders' Association from 1917 to 1920.

CRACKING OF PETROLEUM. See CHEMISTRY, ORGANIC; PETROLEUM.

CRAFTS, WILBUR FISK (1850-1922). An American clergyman (see VOL. VI). He was United States delegate to the Purity Congresses

in 1915, 1916, and in the same years was a member of the Union National Commission to frame an amendment for Constitutional Prohibition. In 1917, he became a member of the Presbyterian Social Service Commission and of the United Committee of War-time Activities. At the time of his death he was superintendent of the International Reform Bureau at Washington, D. C. Among his later works are: *The Bible in School Plans in All Lands* (1914); *Bible Stories and Poems* (1914); *Dress Reform* (1918); *Why Dry? Briefs for Prohibition, Local, State, National and International* (1918, 1919); *Made in Mayflower Land* (1920); *That Boy and Girl of Yours, and Other Addresses* (1921).

CRAIG, AUSTIN (1872-). An American historian, born at Eddytown, N. Y., and educated at Cornell University, the University of Rochester and Pacific University, Ore. From 1895 to 1898, he was school superintendent in Oregon. In the latter year, he was admitted to the bar and began the practice of law. In 1904, he entered the Philippine Civil Service. In 1912, he became assistant professor of history in the University of the Philippines, and in 1918, Rizal research professor and head of the department of history. His works include: *The Story of José Rizal* (1909); *Los Errores de Retana* (1910); *The Lineage, Life and Labors of José Rizal* (1912), and *The Story of the Philippine People* (1919). He also edited the following: *The Rizal Translations* (1912-14); *Pre-Spanish Philippine History, A.D. 43-1521* (1915); *The Former Philippines through Foreign Eyes* (1915); *The Beginnings of Philippine Nationalism* (1916); *Famous Filipinos* (1916); *Rizal's Own Story* (1919); *The Filipinos' Part in the Philippines' Past* (1921).

CRAIG, CHARLES FRANKLIN (1872-). An American bacteriologist (see VOL. VI). Dr. Craig was appointed curator of the Army Medical Museum in 1918, resigning to accept in 1920 the chair of bacteriology, parasitology and preventive medicine at the Army Medical School, Washington, D. C. He was also appointed director of laboratories. His monograph, *The Wassermann Test*, was published in 1918.

CRAIG, EDWARD GORDON (1872-). An English actor (see VOL. VI). His recent publications on the theatre include *The Theatre Advancing* (1921) and *Scene* (1923).

CRAMER, JOHN LUTHER (1871-). An American railway official, born in Burlington, Iowa. He was educated in the schools of that city and began his railway career with the Chicago, Rock Island and Pacific Railway as clerk, in 1883. In the years immediately following, he served in various capacities with the Montana Central and other roads in the West and Northwest. From 1889 to 1902, he was auditor of the Great Northern Railway and was assistant comptroller of the Rock Island System from 1902 to 1904. From 1904 to 1911, he was vice-president and comptroller of the C. H. & D. Railway Company, and from 1904 on served in various offices with the Pere Marquette Railroad Company; in 1920, he became vice-president and treasurer of that company.

CRANE, CHARLES RICHARD (1858-). An American business man and diplomat, born at Chicago and educated in the public schools of that city. He early entered business and

from 1894 to 1914 was vice-president or president of the Crane Company of Chicago. In 1917, he was a member of the President's Special Diplomatic Commission to Russia, and in 1919 was American Commissioner on Mandates in Turkey. In 1920-21, he was American Minister to China.

CRANE, FRANK (1861-). An American journalist (see VOL. VI). His recent works include: *War and World Government* (1915); *Adventures in Common Sense* (1916); *The Looking Glass* (1917); *Christmas and the Year Round* (1917); *Dr. Frank Crane's Opinion of Astrology* (edited by F. T. Allen, 1918); *Lighted Windows* (1918); *400 Four Minute Essays* (10 vols., 1919), and *The Crane Classics* (10 vols., 1920). He also translated, with Arthur Crane, *Bhagavadgita*, or *The Battle of Life—the Ancient Poem of India* (1918).

CRANE, WALTER RICHARD (1870-). An American mining engineer, born at Grafton, Mass. He was graduated in 1895 at the University of Kansas, took post-graduate courses there in 1896 and then studied at Columbia, obtaining his Ph.D. in 1901. In 1898, he became assistant professor of mining at Kansas and seven years later returned to Columbia, where he taught until 1908, when he accepted a call to the chair of mining at the Pennsylvania School of Mines and Metallurgy, also serving as dean. In 1918, he went to Washington and became mining engineer with the United States Bureau of Mines, and in 1920 he was chief engineer of the War Minerals Relief Commission. In 1921, he became superintendent of the Southern Mining Experiment Station in Birmingham, Ala. Dr. Crane also served on the United States Geological Survey during 1902-05. In addition to many other technical papers, he is the author of *A Treatise on Gold and Silver* (1908), *Index of Mining Engineering Literature* (1909), and *Ore Mining Methods* (1910).

CRANES, ELECTRIC. See ELECTRIC MOTORS IN INDUSTRY.

CRAPSEY, ALGERNON SIDNEY (1847-). An American author and former Protestant Episcopal clergyman (see VOL. VI). Included among his later works are: *The Rise of the Working Class* (1914); *The Ways of the Gods* (1920), and *The Last of the Heretics* (1924).

CRAVATH, PAUL DRENNAN (1861-). An American lawyer, born at Berlin Heights, Ohio. He was educated abroad and at Oberlin College, graduating in 1882. He graduated from the Law Department of Columbia University in 1886, and in the same year was admitted to the bar. He was advisory counsel of the American Mission to the Inter-Allied Council on War Purchases and Finance, in London and Paris, in 1918, and was awarded the Distinguished Service Medal for exceptionally meritorious service during the War. He also received decorations from the French and Italian governments. He was a member of many legal and other societies.

CRAVEN, FRANK (?-). An American actor and dramatist who played in the United States until 1913, when he went to London in *Bought and Paid For*. He returned to the United States with his own play, *Too Many Cooks*, in which his acting established his reputation, and which he took to London in 1919. Other plays in which he has acted are: *This Way Out* (his own play, 1917); *Going Up*

(1917); *The Girl from Home* (1920); *The First Year* (His own play, 1920). In collaboration with George V. Hobart he wrote *The Little Stranger*. He also wrote *Spite Corner* (1921).

CRAWFORD, WILLIAM HENRY (1855-). An American educator (see VOL. VI). He was appointed National War Work Council secretary of the Y. M. C. A. in 1917, and went to France in 1917-18. In 1920 he resigned as president of Allegheny College, becoming president emeritus. He is the author of *The American College* (1915).

CREDIT, COÖPERATIVE. See COÖPERATION.

CREDIT BANKS. See AGRICULTURAL CREDIT.

CREDIT UNIONS. See COÖPERATION.

CREEL, GEORGE (1876-). An American editor and author, born at Blackburn, Mo., and educated in the public schools. From 1899 until 1913, he was successively editor of *The Kansas City Independent*, *The Denver Post* and *The Rocky Mountain News*. In 1917-19, he was chairman of President Wilson's Committee on Public Information. His works include: *Quatrains of Christ* (1904); *Children in Bondage* (1913); *Wilson and the Issues* (1916); *Ireland's Fight for Freedom* (1919); *How We Advertised America* (1920); *The War, the World and Wilson* (1920); *Police Commissioner Enright Replies to His Critics* (1921), and *Uncle Henry, Anonymous* (1922 Introduction by Irvin S. Cobb).

CREIGHTON, JAMES EDWIN (1861-1924). An American philosopher. Both as editor of the *Philosophical Review* and as professor at the Sage School of Philosophy (Cornell University), he continued to exercise a strong influence in the direction of idealism. On the occasion of the twenty-fifth anniversary of his service to philosophy, a testimonial volume of essays was published by former pupils of the Sage School (1917).

CREWS, LAURA HOPE (?-). An American actress born in San Francisco, who made her first appearance on the stage as a child. She appeared later in stock and played with Frances Starr. Her recent characterizations, which have been among her best, include: Mrs. Deane in *Peter Ibbetson* (1917); Mrs. Sherman Fessenden in *On the Hiring-Line* ("The Wrong Number") (1919); *The Wife in Tea for Three* (1920); *Olivia in Mr. Pim Passes By* (1921).

CRICKET. See SPORTS.

CRILE, GEORGE WASHINGTON (1864-). An American surgeon (see VOL. VI). Dr. Crile was very active throughout the War, and before the participation of the United States was at the head of the Lakeside Hospital Unit attached to the British Expeditionary Force in France. After the entry of the United States, he was again in France in the capacity of senior consultant in surgical research and was made colonel of the Medical Officers Reserve Corps. In 1921, with others, he founded the Cleveland Clinic, an institution for clinical and research activities in Cleveland. He has written the following books since 1914: *The Origin and Nature of the Emotions* (1915); *A Mechanistic View of War and Peace* (1915); *Man as an Adaptive Mechanism* (1916); *The Kinetic Drive* (1916); *A Physical Interpretation of Shock* (1921); *Surgical Shock and the Shockless Operation* in collaboration with Lower (1920).

CRIMINOLOGY. See PENOLOGY.

CRISP, ARTHUR (1875-). An American painter. He was born at Hamilton, Ont. and studied with Bryson Burroughs and Frank Dumond at the Art Students' League, New York City. His art is essentially decorative, and he is best known as a mural painter. Among his most important murals are the decorations of the Belasco Theatre and the Playhouse, in New York City, and of the Houses of Parliament in Ottawa, Canada, besides many private residences in the United States. His best known recent canvases are "British Recruiting on Boston Common," in the Commons' reading room of the House of Parliament, Ottawa, and "L'Encre," Canadian National Gallery. He was elected Associate of the National Academy of Design in 1911, won the first Hallgarten prize at the National Academy in 1916, and the gold medal at the New York Architectural League in 1923.

CROATIA. See **JUGO-SAVIA**; **SLAVONIC LITERATURE.**

CROCE, BENEDETTO (1866-). An Italian philosopher born at Pescasseroli, Aquila, Italy. Although he accomplished his mature work between his 30th and 50th years, his reputation in Anglo-Saxon countries has developed very largely since the War. The publication of a biographical volume in English by Piccoli (1923) has corresponded to the growing interest in a philosopher who, like Bergson, is able to combine popular appeal and intellectual insight. His theory of aesthetic as the expression of intuitions found literary champions in America in Mr. Joel Spingarn and his group, and this part of his philosophy is by far the most widely read. At the close of the War, Signor Croce took an active part in Italian politics. He attacked the humanitarian ideals of President Wilson, which he regarded as shortsighted and dangerous to Italian interests. He was made senator, and in 1920 served as minister for education in the cabinet of Giolitti. His works published since 1915 include a volume of *New Essays on Aesthetics* (English translation 1921); *Pagine sparse* (3 vols., 1919-20), *La Poesia di Dante* (1921; English translation, 1922); *La Spagna nella vita italiana durante la rinascenza* (1917); *Storia della Storiografia italiana* (1921), and *Ariosto, Shakespeare and Corneille* (1920). See **ÆSTHETICS** and **ITALIAN LITERATURE.**

CROCKER, BOSWORTH (MRS. LUDWIG LEWISOHN). (?-). A playwright born in London. She was brought to the United States as a child and educated in America. She is best known for her plays, *The Dog*, produced by the Bryden Road Players (1915); *The Last Straw* (1917); *Pawns of War* (1918); *The Baby Carriage* (1919); *Humble Folk*, a collection of one-act plays with a foreword by Ludwig LewisoHN (1923). She also wrote a novel, *Don Juan's Wife* (1924) and contributed verse and critical articles on the drama to contemporary magazines.

CROISSET (JOSEF MARIE) ALFRED (1845-1923). A French philologist (see **VOL. VI**). He is the author of *L'effort de la France* (1916), *Les democracies antiques* (1916) and *History of Latin and Greek and Democracy* (1919). He has also edited *Otero José Pacifico: L'Argentine devant l'histoire* (1921).

CROISSET, MAURICE (1846-) (see **VOL. VI**). A French philologist. He is the author of *Les civilisations helléniques* (1922) and has

translated into Spanish *Homer: la Odissea* (1921) and collaborated with his brother on a translation of *Euripides*.

CROKER, BITHIA MARY (SHEPPARD) (?-1920). An English novelist (see **VOL. VI**). She died in London on Oct. 21, 1920. Her works written since 1914 include: *Lismoyle* (1914); *Her Own People* (1914); *Babes in the Wood* (1915); *Given in Marriage* (1916); *Johanna* (1917); *Bridget* (1918); *The Chaperon* (1920), etc.

CRONAU, RUDOLF (1855-). A German journalist and author born at Solingen. He has spent a great part of his time in New York. Among his works are: *Geschichte der Solinger Klingeindustrie* (1885); *Unter dem Sternbanner* (1887); *Das Buch der Reklame* (1889); *Im wilden Westen* (1890); *Amerika, Geschichte seiner Entdeckung* (1890), *Our Wasteful Nation* (1908), *Drei Jahrhunderte deutschen Lebens in Amerika* (1909); *The British Black Book* (1915); *Our Hyphenated Citizens* (1915); *German Achievements in America* (1916), and *Woman Triumphant, the Story of Her Struggles for Freedom* (1919).

CROOKS, WILLIAM (1852-1921). An English labor leader (see **VOL. VI**). In 1916, he was appointed Privy Councillor. He died soon after his retirement from Parliament in 1921.

CROSLAND, THOMAS W (WILLIAM) HODGSON (1868-). A British editor and author (see **VOL. VI**). His later works include: *The Chant of Affection* (1915); *The Showmen* (1915); *The Soul of a Crown Prince* (1915), and *The English Sonnets* (1916).

CROSS, (CHARLES) WHITMAN (1854-). An American geologist (see **VOL. VI**). In 1918, he was president of the Geological Society of America, and an officer of the National Research Council. He was also author of geological reports and maps published by the United States Geological Survey.

CROSS, WILBUR LUCIUS (1862-). An American university dean (see **VOL. VI**). In 1916, he became dean of the Graduate School of Yale University, and in 1921, professor of English, resigning from a similar position in the Sheffield Scientific School. He is the author of *A History of Henry Fielding* (1918), and editor of the following: *Sterne's Political Romance* (1914); *Lounsbury's Life and Times of Tennyson* (1915), and *Shakespeare's Love's Labor's Lost* (Yale Shakespeare, 1918).

CROTHERS, RACHEL (?-). An American playwright born at Bloomington, Ill., who directs the production of her own plays. The quality of her work is good and her plays are exceptionally well known in the United States. They include: *The Three of Us*; *The Coming of Mrs. Patrick*; *Myself Bettina*; *A Man's World*; *Young Wisdom*; *Ourselves*; *The Heart of Paddy Whack*; *Old Lady 31*; *Once Upon a Time*; *Mother Carey's Chickens*; *A Little Journey*; *39 East*; *He and She*; *Nice People*; *Everyday*; *Expressing Willie*.

CROWDER, ENOCH HERBERT (1859-). An American army officer. He was educated at the United States Military Academy, and at the University of Missouri Law School, and became major in the United States Judge Advocate's office in 1895. He was in the Philippines from 1898 to 1901, and with the Japanese army in Manchuria in 1904-05. In 1899-1902, he was Judge Advocate General of the Army of Cuban Occupation; he drafted the legal code for the

new republic and also helped to frame its constitution and to direct its financial policies and legislation. General Crowder is best known for his remarkable record as Provost Marshal General during the War in administering the selective service act which he himself had drafted. Under this law, about 24,000,000 men altogether had been registered and classified within 18 months after America had entered the war, two million of whom were in France, and almost as many more ready to go. In 1923, the rank of the United States' representative in Cuba was raised to that of ambassador, and General Crowder was the first to serve in that capacity. See CUBA.

CROWELL, BENEDICT (1869-). A mining engineer, born in Cleveland, Ohio, who entered War Service in 1916 and was a member of the Kernan board of the War Department to report on munitions of war and arsenals. In 1917 he was appointed Assistant Secretary of War and in the next year was made director of munitions. Among his recent books are *The Iron Ores of Lake Superior* and *How America Went to War*, in collaboration with Capt. Robert T. Wilson.

CROWTHER, SAMUEL (1880-). An American author, born at Philadelphia. He was educated at the University of Pennsylvania and subsequently engaged in newspaper work. He toured Europe in 1918-19 and collected his impressions in several volumes. His most important work was *Henry Ford* (with Henry Ford, 1922), an excellent analysis of the mental processes of a large industrialist.

CROZIER, WILLIAM (1855-). A United States artillery officer (see VOL. VI). He was chief of ordnance from the beginning of the War until December, 1917; member of the War Council, and commander of the Northeastern Department in 1918.

CRUISER. See VESSEL, NAVAL.

CRUISER, ARMORED. See VESSEL, NAVAL.

CRYSTAL STRUCTURE. See PHYSICS.

CUBA. An island republic of the West Indies with an area of 44,215 square miles and a population according to the census of November, 1919, of 2,889,004. This was a gain of 840,024 over the last census year, 1907, or an annual average increase of 3.4 per cent. The white population increased, with a proportion to the total population in 1907 and 1919 respectively of 69.7 and 74.3 per cent. Males continued in excess of females, the proportions for the two years were 52.5 and 53 per cent. Toward the end of the decade 1914-24, immigration, largely from Spain, but also from Haiti and Jamaica, increased enormously. In 1911, it amounted to 38,053; 1919, 80,485; 1920, 340,241; 1921-22, 128,177. Immigration was of a transitory character, a large proportion of the immigrants returning to their native countries at the end of the sugar crop season. Populations of the large towns in 1907 and 1919 were: Havana, the capital, 295,157 and 363,506; Cienfuegos, 30,100 and 95,865; Camaguey, 29,616 and 98,193; Santiago de Cuba, 45,470 and 70,232; Matanzas, 36,009 and 62,638. The official estimate of population for Dec. 31, 1922, was given as 3,123,040, of whom a little over 70 per cent were whites. The progress of education was slow during the period 1911-22, for though registration almost doubled over the 11 years, attendance remained about the same. In

1911, average attendance was 105,774; in 1921-22, 183,672. In the latter year there were 3337 school houses open, served by 6075 teachers.

Industry. Sugar cultivation continued the leading activity and the source of the country's well-being. The crop consistently increased after 1913. For that year the crop was 2,443,086 long tons. The crop reached the very large total of 4,104,205 long tons in 1919 but dropped to 3,758,347 long tons in 1920. 1921 again showed an upward turn; 3,974,116 long tons were produced in that year. The 1922 crop reached almost 4,000,000 tons, while that of 1923, falling below previous estimates, showed a total production slightly in excess of 3,600,000 tons. Estimates for the 1924 crop made it at least equal to that of 1923. In 1912, 92 per cent of the whole crop went to the United States at a price between \$.02 and \$.03. The 1917-18 crop at \$.046 and the 1918-19 crop at \$.055 went mostly to the United States, but the failure of the Americans to buy the 1919-20 crop, together with the world shortage, sent the price crazily upward, so that by mid-year, 1920, it reached \$.235. The market then broke, and by the end of the year, sugar dropped below \$.04. During 1921 the fall was continuous; the price reached \$.02 or less, and Cuban growers carried over a heavy surplus into 1922. Conditions began to improve with that year as the price once more ascended. The purchase of sugar by the United States reflects the state of affairs. In 1913-14 the United States bought 4,926,606,000 pounds for \$98,394,782; in 1921, 5,180,145,000 pounds for \$194,156,615; in 1922, 9,054,289,838 pounds for \$227,257,590; and in 1923, 6,852,685,625 pounds for \$331,925,712. Tobacco was the crop of next greatest economic importance. In 1913 over 27,500,000 pounds (value \$16,164,795) were exported to the United States; in 1922, 22,600,000 pounds (value \$19,898,309). The 1923-24 tobacco crop was expected to be the largest in the history of Cuba. Other agricultural products were coffee, cacao, and tropical vegetables and fruits for the American winter markets; the economic value of these groups remained slight. Cattle raising was receiving increasing attention with the result that herds increased from 2,829,553 heads in 1912 to 4,771,394 in 1922. Horses similarly increased in number. Mineral areas were considerable; 1921, 407,000 acres of iron, 248,000 of copper, 102,300 of oil, and 42,000 of manganese. Exports to the United States dropped off, for interest in mining was not great. In 1913-14, 1,289,000 tons of iron ore were exported to the United States; in 1922, 381,746 tons.

Commerce. Imports in 1912 totaled \$120,229,317 and exports \$146,787,295; for 1918-19 they reached \$316,000,000 and \$477,000,000, and in 1919-20, the very high point of \$433,000,000 and \$862,000,000, for 1920-21 they dropped to \$356,435,000 and \$278,000,000, and for 1921-22 to \$180,259,000 and \$323,911,000. By 1923, imports once more ascended to \$226,118,000 for the fiscal year. The United States remained the most important factor in Cuba's foreign trade, the proportions for exports and imports ranging between 70 and 80 per cent of the whole. In 1913-14 the American imports from Cuba totaled \$132,303,795; for 1920, \$721,693,880; for 1922, \$267,840,867, and for 1923, \$376,442,581. American exports to Cuba amounted to \$68,884,428 in 1913-14; for 1920, \$515,208,-

731; for 1922, \$127,873,202, and for 1923, \$192,437,533. The importance of this trade may be gauged by the fact that in 1920, American imports and exports from and to Cuba almost equaled the whole United States trade with South America. For 1922-23 the American trade with Cuba was equal to 75 per cent of the whole South American trade. Other countries participating in Cuban trade during the period 1913-24 were Great Britain, Spain, and France. Imports, in order of importance, were foodstuffs, textiles, metals and metal goods, machinery, drugs, and wood. Cuba ranked fourth among countries exporting to the United States and seventh among importers of American goods.

Finance. For 1912-13 estimated revenues were \$37,940,000, and expenditures \$33,974,147; for 1922-23, \$55,638,800 and \$51,852,302; for 1923-24 (estimates), \$68,500,000 and \$67,779,438, and for 1924-25 (estimates), \$76,719,000 and \$66,400,282. The national debt in 1911 was \$62,083,100, with the debt service, in 1911, \$2,464,585. In July, 1922, the public debt was \$91,542,400 and in July, 1923, \$173,000,000, funded and floating. In January, 1923, a loan of \$50,000,000 was floated in the United States. The result was that the budget for 1923-24 carried the large figure of \$12,248,000 for the debt service. By the law of November, 1914, a Cuban coinage was established, with a gold peso equal to the American dollar. American coinage remained legal tender. Cuban currency in circulation in January, 1921, was \$23,787,250 gold, \$8,413,140 silver, and \$1,449,560 nickel. It was estimated that there was also in circulation in 1923 \$2,000,000 in United States gold coin and more than \$100,000,000 in United States paper notes. In an effort to hasten the stabilization of financial conditions, the United States Federal Reserve Board granted the applications of the Boston and Atlanta Federal Reserve Banks to establish agencies in Cuba in June, 1923. At the same time, as a result of the recommendations of the former governor of the Federal Reserve Board, W. P. G. Harding, who had served as financial adviser to Cuba in 1922, a Cuban national commission reported in favor of the creation of a Cuban Reserve Bank with powers to accept deposits, rediscount commercial paper, and issue paper currency.

Economic Conditions. In 1920 financial affairs reached so chaotic a condition that a national moratorium was declared on October 10 for 50 days and was then extended several times, until Jan. 31, 1921. This was precipitated by the break in the sugar market and the fact that banks had lent as much as \$.15 and \$.16 on sugar stored in warehouses by speculators who were waiting for a rise in price. Eighteen of the Cuban banks went into the hands of a liquidation commission. Rejected merchandise, amounting to an estimated invoice value of from \$60,000,000 to \$100,000,000, accumulated in bonded warehouses, with the result that American exporters were particularly hard hit. It was not until 1922 that conditions began to show improvement. By 1922 seven banks had already been liquidated; settlements made through the Havana Clearing House began to increase; and interest rates decreased. On Jan. 4, 1921, in the interest of the United States, General Crowder went to Cuba as adviser. The end of 1923 saw conditions in general in Cuba distinctly favorable. Sugar prices

were firm, and crop prospects were fairly good, with estimates ranging from 3,500,000 to 3,700,000 tons. It was expected that the 1923-24 tobacco crop would be the largest in the history of Cuba, with prices continuing at a high level. Government income exceeded expenses consistently during the early months of 1924, and imports and exports were much higher than in 1923. Sales in many lines were better than for the corresponding months in 1922, and business in general was in a satisfactory condition.

Communications. In 1922 there were 3020 miles of railway as compared with 2200 in 1913. The largest developments of the period 1913-23 centred in the construction of motor roads, so that by November, 1922, there were 1500 miles of these fit for travel. An air service was started in 1920 between Havana and Key West, Fla. In 1922 steam vessels with an aggregate of 5,498,850 net tons entered Cuban ports in the foreign trade. An enactment whose implications seriously affected the conduct of the sugar trade was the Tarafa bill, signed Oct. 9, 1923. It provided for the formation of a holding company under which all Cuban railways were to be consolidated. American sugar interests attacked it because it aimed at closing many of the small ports used in the sugar trade. The result was that on the request of the United States State Department certain monopolistic provisions were eliminated.

History. The country continued peaceful, and as a result of the large sugar crops, became increasingly prosperous. With the approach of the presidential elections, partisan feeling accounted for many disorders. The election of 1916 was closely contested, with the result that because of irregularities charged by the Liberals, a revolt broke out under ex-President Gomez on Feb. 9, 1917. By March the government had the uprising well in hand, being aided, materially, by the presence of American forces in the province of Oriente and, morally, by the condemnation of the rebels by Secretary of State Lansing. In May, 1917, the Cuban Congress announced the reelection of President Menocal over his Liberal opponent, Alfredo Zayas. On Apr. 7, 1917, both houses of Congress unanimously passed a measure declaring war on Germany, and financial measures to put the country on a war footing were drawn up. A war loan of \$13,000,000 was raised, and extraordinary taxes were placed on sugar and on the profits of mining and insurance companies. In 1918 a draft act was passed and the office of an alien property custodian created. In 1919, as a result of the aid of General Crowder, a new electoral law provided for obligatory voting and the public counting of ballots. In 1920, the year of the presidential election, sentiment was again at a high pitch. The office was contested by Dr. Alfredo Zayas, running on a coalition Conservative-Liberal ticket, and his old leader Gen. José Miguel Gomez. Zayas's supporters had united with the Conservatives because of their fear of Gomez's strength. Zayas was declared elected, but the unwillingness of the Gomez partisans to accept the result again threatened a national crisis. This, and the moratorium, led President Wilson to send General Crowder once more to Cuba. New elections were held in four provinces on Mar. 15, 1921, with the result that Zayas's election was confirmed and he was inaugurated on May 20. General Crowder's continued stay on

the island occasioned criticism, and so did the presence of American marines at Camagüey. General Crowder's presence stimulated the passage of a series of noteworthy administrative reforms which included a new civil service law, improvement of the accounts system, means for facilitating the removal of judges, and the contraction of a large foreign loan. General Crowder returned to the United States in October, 1922. In January of the same year, the American marines had been removed from the island. The loan of \$50,000,000 was approved by the United States, in accordance with the Platt Amendment, and was floated in January, 1923. This measure, together with the political reforms mentioned, aided materially in bringing the country back to its former commercial prosperity, so that by 1923 the financial depression of 1920-21 was being rapidly obviated. General Crowder was nominated as the first American Ambassador to Cuba on Feb. 9, 1923, and proceeded at once to his post. Dr Cosme de la Torriente was appointed Cuban Ambassador to the United States on Sept. 1, 1923. Two days later he was elected President of League of Nations Assembly at Geneva. The continued participation by the United States in Cuban affairs was protested, and the Cuban Congress by a joint resolution in July, 1923, declared that "outside interference with their civil affairs" might prejudice Cuba against the United States. As a result Ambassador Crowder was summoned to Washington to confer with the State Department. A new force in Cuban domestic affairs emerged in August, 1923, with the formation of the Veterans' and Patriots' Association. It immediately began to conduct a campaign against public graft; the Tarafa bill (see above, *Communications*), the national lottery, the disabilities of women, and for the paying of soldiers' back pensions. It was so powerful that its programme was at once adopted by one of the candidates for presidential honors. In 1924, this propaganda almost succeeded in precipitating a national crisis. President Zayas moved against the Association with alacrity; its leader, General García-Vélez, was dismissed from the diplomatic service and compelled to quit the country; *El Sol*, the Association's organ, was suppressed on March 25. García-Vélez took refuge in New York and continued to direct activities, and sentiment in Cuba became feverish. An armed revolt broke out on April 29, in Central Cuba; to this the government replied by seizing the leaders of the Veterans' and Patriots' Association. Fighting went on for two weeks, principally in the provinces of Santa Clara and Oriente, but the back of the rebellion was broken when President Zayas succeeded in inducing the United States War Department to sell the Cuban government large stores of arms and ammunition. Materials to the value of \$208,000 were purchased in this way by May 10. A general amnesty was granted May 17. Hostile elements insisted that the incident had been enormously magnified, for the most part by Zayas himself who sought to strengthen his popularity in Cuba, and that the Veterans' and Patriots' Association, instead of being discredited, remained a great force in internal affairs. At any rate, in the summer of 1924, it was seen that Zayas's position was unstable.

CUBISM. See **PAINTING**.

CULBERTSON, WILLIAM SMITH (1884-).

An American lawyer and tariff expert, born at Greensburg, Pa. He graduated from the College of Emporia, Kan., in 1907, and from Yale University in 1908. After taking special courses in German universities, he became examiner of the United States Tariff Board in 1910, serving until 1912. From 1917, he was a member of the United States Tariff Commission. He was reappointed for a term of 12 years from 1921, by President Harding. From 1922, he was vice-chairman of the board of the commission. During the War he was engaged in Y. M. C. A. service in France, and in services for the government at the Peace Conference in Paris. He is the author of *Alexander Hamilton, an Essay* (1911) and *Commercial Policy in War Time and After* (1919).

CULLEN, THOMAS STEPHEN (1868-). An American gynecologist, born at Bridgewater, Ont. He was educated at the Toronto Collegiate Institute and the University of Toronto. He became associated with the Johns Hopkins Hospital College and was made a professor of clinical gynecology at the latter and visiting gynecologist to the hospital. He has written, alone, and in collaboration, four important monographs: *Cancer of the Uterus* (1900), *Adenomyoma of the Uterus* (1908), *Myomata of the Uterus* (1909), *Diseases of the Umbilicus* (1916).

CULTURE, HISTORY OF. See **ETHNOLOGY**.

CUMBERLAND, WILLIAM WILSON (1890-). An American economist, born at La Verne, Cal., and educated at Occidental College, Los Angeles, and at Columbia and Princeton universities. In 1916, he became a member of the faculty of the University of Minnesota. In 1918-19, he was economic or financial expert on several United States government boards and commissions in France and Armenia. In 1919-20, he was financial expert with the United States High Commission in Turkey, and the following year was attached to the Department of State as expert on foreign trade. In 1921, he was appointed Administrator of Customs of the Republic of Peru. He published *Cooperative Marketing* (1918).

CUMBERLAND PRESBYTERIAN CHURCH. This denomination originated in Tennessee in 1810 as an outgrowth of the revival of 1800 in Kentucky and Tennessee and in protest against some of the doctrines taught by Calvinists of that day. The membership in 1923, according to figures supplied by the organization, was 65,000, as compared with a membership of 72,052 by the Federal census of 1916, and the number of ministers in 1923 was about 800, as compared with 728 in 1916. In the latter year there were reported 12 synods and 70 presbyteries. As a result of the merger movement of 1906, when about half the denomination joined with the Presbyterian Church in the United States of America, the Cumberland branch in 1914 was practically without property and without any educational endowment; in 1924 it owned a good educational plant at McKenzie, Tenn., with buildings and equipment valued between \$150,000 and \$200,000; \$500,000 in endowment; a faculty of 20 persons, and a publishing plant having \$65,000 assets above liabilities.

CUMMINS, ALBERT BAIRD (1850-1926). An American senator (see Vol. VI). He was reelected United States senator for the terms 1915-21 and 1921-27. He was joint author

with Representative Esch of the act which returned the railroads to private ownership after the War.

CUMONT, FRANZ VALÉRY MARIE (1868-). A Belgian writer on Oriental Religions (see VOL. VI). Besides being a corresponding member of learned bodies in various countries, he is author of *Etudes syriennes* (1916), and *After-life in Roman Paganism* (1922).

CUNNINGHAM, LEON (?-). A playwright, whose best known recent play was *Hospitality*, produced at the Forty-eighth Street Theatre (New York) in 1922. He also wrote *The Draldo Bloom* (1919) and *The Wondership* (1919), one-act plays of considerable beauty.

CUNO, CARL JOSEPH WILHELM (1846-). A German chancellor, and director-general of the Hamburg-American Steamship Line. He was born at Suhl, Thuringia, Germany, in 1846, and educated at Berlin, Heidelberg, and Breslau. He became connected with the department of the treasury in 1906, and in 1912 was made privy counselor. During the War he was director of the grain and food organization, and upon the death of Albert Ballin became the head of the Hamburg-American Steamship Line. He represented Germany at Brussels and Versailles, and became chancellor in November, 1922. He was much criticized because of his policy of passive resistance to the French occupation of the Ruhr, and also for the fall of the mark. He resigned on Aug. 12, 1923, the immediate cause being the loss of Socialist backing in the Reichstag. Upon a number of occasions, Dr. Cuno was urged to accept the post of German Ambassador to the United States.

CUREL, FRANÇOIS, VICOMTE DE (1854-). A French dramatist (see VOL. VI). He recently wrote *L'Âme en Folie*, *La Comédie du Génie*, and *L'Irrescue du Sage*.

CURLEY, MICHAEL JOSEPH (1879-). An American bishop, born at Golden Island, Athlone, Ireland, and educated in the Royal University of Ireland and at the College of the Propaganda Fide in Rome. He was ordained to the Roman Catholic priesthood in 1904, and for the 10 ensuing years was a missionary in Florida. In 1914, he was made Bishop of Saint Augustine and in 1921 Archbishop of Baltimore.

CURRELLEY, CHARLES TRICK (1876-). A Canadian clergyman, director of the Royal Ontario Museum of Archaeology (see VOL. VI). In 1919, he returned from his eight-year collecting trip in Egypt and Europe.

CURTIS, CHARLES (1860-). An American senator (see VOL. VI). He was reelected to the United States Senate for the terms 1915-21 and 1921-27.

CURTIS, GLENN HAMMOND (1878-). An American aviator (see VOL. VI). In 1914, he designed and constructed for Rodman Wanamaker the *America*, which was the first heavier-than-air flying boat made for transatlantic passage. In 1917, in conjunction with J. N. Willys, he increased the output of his factories to meet the war demands of England, Russia and the United States. He developed all types of aircraft, especially the *Wasp*, the holder of world records for speed and altitude, and, with the United States navy, the Navy-Curtiss flying boats 1, 2, 3, and 4.

CURTISS, RALPH HAMILTON (1880-).

An American astronomer, born at Darby, Conn. He was graduated in 1901 at the University of California, where in 1904 he received his Ph.D. After serving as an assistant in astronomy at California during 1900-01 he was a fellow during 1901-05 at the Lick Observatory, and was a member of the Lick Eclipse Expedition (1901) to Sumatra. In 1905, he became assistant astronomer at Allegheny Observatory and two years later, assistant professor of astrophysics at Michigan, where in 1918 he became full professor, also serving as assistant director of the Detroit Observatory. His researches have had to do chiefly with the spectroscopy of the heavenly bodies, photography of comet forms, spectrography of variable stars, and of stars with peculiar spectra in Class B, on all of which he has published papers.

CURWOOD, JAMES OLIVER (1878-). An American author, born at Owosso, Mich. From 1900 to 1907, he was engaged in newspaper work, but in the latter year resigned from these activities to devote himself exclusively to novel-writing. His romances enjoyed a wide popularity and sold by the hundreds of thousands annually. They were usually vivid tales of the Canadian Northlands, depicting conventional emotions and conflicts, but written with an earnestness that often gave them the aspect of reality. The better known included: *Flower of the North* (1912); *God's Country and the Woman* (1915); *Nomads of the North* (1919); *The Valley of Silent Men* (1920); *The Country Beyond* (1922).

CURZON LINE. See VILNA.

CURZON OF KEDLESTON, GEORGE NATHANIEL CURZON, FIRST MARQUIS OF (1859-1925). An English statesman (see VOL. VI). In 1915, he became a member of the Asquith Coalition Cabinet and as such played a prominent rôle in the conduct of the War. Under the Lloyd George government of 1916, he advanced to even higher honours. He became government leader of the House of Lords, President of the Council, and one of the four members of the inner War Cabinet in whose charge rested the details of all military and civilian operations. With the passing of Arthur Balfour in 1919 he took control of the Foreign Office. He continued at the head of foreign affairs through the Lloyd George, Bonar Law, and Baldwin ministries, though in the first he was largely overshadowed by the operations of his superior. In the Bonar Law and Baldwin governments, he was given a free hand, and Europe and America again witnessed the characteristic and possibly unfortunate boldness that had distinguished his Indian career. For a time he almost seemed on the verge of succeeding with the eighteenth century diplomatic methods which he conspicuously adopted. It was declared of him that he treated Trotsky and Mastaplia Kemal as though they were Tallyrands. Malicious critics said that the dukedom, which he so ardently desired, was within his grasp. But he really failed. France and England continued to draw farther and farther apart; British policy in Turkey, Mesopotamia, and Egypt, was characterized by a series of blunders; Russia continued estranged. When the Baldwin government went out in January, 1924, Curzon's name was not mentioned for a dukedom in the King's honor list. In 1924, Curzon practically put the capstone on his political career: he announced the preparation of his memoirs. In

1916 he married, as his second wife, Grace Elvina, daughter of J. Monroe Hinds, American minister to Brazil, and widow of Alfred Dugan, an Argentine millionaire. In 1923, he published *Tales of Travel*.

CUSHING, HARVEY (WILLIAMS) (1869-). An American surgeon (see VOL. VI). During the War, Dr. Cushing was director of United States Base Hospital No. 5. His monograph, *Tumors of the Nervus Acusticus*, was published in 1917.

CUTHELL, CHESTER WEIHE (1884-). An American lawyer, born in New York City. After graduating from Columbia University Law School, he began the practice of law in New York City, and also in Washington. In 1918-19, he acted as general counsel of the United States Shipping Board Emergency Fleet Corporation, and effected collections of claims of the War Department against England, France and Italy. For his services, he was awarded the Distinguished Service Medal and decorations from the governments of France and Italy.

CYCLING. See SPORTS.

CYCLONES. See METEOROLOGY.

CYPRUS. An island of the Mediterranean and a British Crown colony; area, 3584 square miles, population in 1911, 274,108; in 1922, 317,000. The population was 80 per cent Greek and almost 20 per cent Turkish. The leading activity remained agriculture in the decade 1914-24. Chief exports in 1921 (1911 figure in parentheses) were animals, £89,000 (£94,932); carobs, £305,000 (£182,883); wine, £82,000 (£53,685); raisins, £42,000 (£29,636); fruits, £43,000 (£21,585); silk cocoons, £11,000 (£27,587). Imports were foodstuffs, coal, petroleum, cotton piece goods, manufactured articles, and machinery. The trade record over the period showed that the imports for 1913, 1920, and 1922, exclusive of bullion, were £619,337, £2,068,759, and £1,411,697, exports for the same years, £620,591, £1,200,449, and 871,211. The form of government showed no change. Revenues for 1913-14 were £341,816; for 1922, £668,294. Expenditures for 1913-14 were £296,165; for 1922, £719,752. The imperial annual grant was £50,000; the public debt, 1921-22, £215,000. British occupation of Cyprus, since 1878, became outright possession when the British government declared the island formally annexed on Nov. 5, 1914. The later discredited Treaty of Sèvres (1920) with Turkey confirmed the action, and so did the Franco-British agreement of Dec. 23, 1920. The status of the island was given international attention during 1919-23, when its disposition was ironically linked with that of Rhodes by the Italian government. A treaty between Greece and Italy in 1919 provided for the holding of a plebiscite in Rhodes on the question of cession to Greece, only and when Great Britain would hold a similar plebiscite in Cyprus. The stratagem succeeded in keeping the whole question of the Dodecanese (q.v.) and the other Mediterranean islands open until 1923, when the Treaty of Lausanne recognized Great Britain's right in Cyprus and Italy's in Rhodes.

CYRENAICA. See LIBYA.

CYTOLOGY. See ZOÖLOGY.

CZECHO-SLOVAKIA. One of the newly created states of Europe, formed out of all or parts of the old Austro-Hungarian governments of Bohemia, Moravia, Silesia, Slovakia, and

Ruthenia, on Oct. 28, 1918. The frontiers, delimited by the Treaties of Versailles, St. Germain, and the Trianon, and the Ambassadors' Conference of July 28, 1920, affecting the Teschen district, had an area of 54,877 square miles, and a population, by the census of Feb. 15, 1921, of 13,611,349. The provinces, with their areas and populations, are Bohemia, 20,106 square miles, population, 6,670,578; Moravia, 8615 square miles, population, 2,662,845; Silesia, 1767 square miles, population, 671,611; Slovakia, 18,933 square miles, population, 3,000,701; Ruthenia, 4903 square miles, population, 604,670. The principal towns, with their populations in 1921, are Prague, 676,476; Brunn, 221,422; Pilsen, 88,447; Pressburg, 93,329; Kosice, 52,699. Ethnologically, the great majority of the people are Czecho-Slovaks (8,760,957); the ratio between Czechs and Slovaks is about three to one. Of the other races, the Germans include 3,123,000, the Magyars, 747,000, the Ruthenians, 461,000, the Jews 180,000, the Poles, 75,000. From 1910 to 1921, the Czecho-Slovaks increased 9 per cent, and the Ruthenians 6, while the Germans declined 17 per cent and the Magyars 30. By religions, the population was divided into Roman Catholics, 10,384,860; Protestants, 992,083; Greek Catholics, 532,608, and Jews, 353,925. Compulsory education was provided for with particular care in Slovakia and Ruthenia, where the stern policy of Magyarization systematically carried out by the Hungarian government had kept the mass of the population ignorant of their native tongue. In 1921, there were 13,417 elementary schools, of which 64 per cent were Czecho-Slovak, 25 per cent German, 3 per cent Ruthenian, and 6 per cent Magyar. There were also 1411 advanced schools, 388 gymnasias and normal schools, 267 technical schools, 4 polytechnics, and 4 universities. These last were in Prague (one Czech and one German), Brunn (Czech), and Pressburg (Slovak), the last two founded in 1918. By the Treaties, racial minorities were guaranteed protection in their racial and religious rights. In districts where a minority constituted 20 per cent of the population, full rights were accorded for the use of the native tongue in schools and before judicial and administrative bodies. See SLAVONIC LITERATURE.

Agriculture. Because industry in the East was primarily agricultural, the largest single group of workers was busied on the land; this was about 40 per cent of the total population. Methods of production were intensive; aided by a strong government interest, they yielded good profit. The total area of agricultural land was 35,688,750 acres, of which the arable comprised 16,059,938 acres, meadows 6,423,975, and forests 11,778,288; only 1,427,550 were nonproductive. The following table indicates the area and yields of principal crops in 1921.

Crops	Area	Yield in metric tons
Wheat	1,557,806	1,152,756
Rye	2,103,642	1,361,939
Barley	1,615,441	1,033,574
Oats	1,965,769	1,075,387
Potatoes	1,575,791	4,329,166
Sugar Beets	546,200	4,071,655

Live stock (1920) included cattle, 4,351,794; horses, 587,639; pigs, 2,045,780; sheep, 982,258; goats, 1,213,833. These numbers were

considerably less than those antedating the War. The sugar beet industry, which ranked second in the world, engaged 172 factories and refineries in 1921, and these produced 722,955 metric tons of sugar. 457,039 tons were exported in 1921 and 318,179 tons in 1922. Similarly, the hop industry supported 700 breweries which turned out from 7,000,000 to 15,000,000 hectoliters annually. The centre of hop culture was in the Saaz, the breweries in Pilsen. The export of grain, flour, flour products, and malt, in 1921, was 36,103 tons; by 1922, it had increased to 227,157 tons. Land reform, always a crying need in the provinces because of the preponderance of great entailed estates usually owned by foreign families or by German or Magyar overlords, became at once the concern of the new government. By an act of 1919 the National Assembly ordered the expropriation of all estates of more than 475 acres if cultivated and of 350 acres if uncultivated. By January, 1922, 9,746,076 acres had been seized. In Bohemia, farms of $7\frac{1}{2}$ acres or less totaled only 23.5 per cent of the whole area; all the rest consisted of large estates. In Moravia, small farms had totaled 29.6 per cent, and in Silesia, 25.2 per cent. The progressive character of the agricultural class was indicated by the presence of some 10,000 agricultural coöperatives with a membership of 1,000,000.

Minerals and Industries. Coal and iron were the principal minerals. Coal production, including lignite, in 1921 totaled 32,699,112 metric tons; in 1922, 28,848,281 tons. While coal did not suffice for native wants, the yield of lignite was more than sufficient. In the Ostrava-Karvin basin, 70 per cent of the total coal production was mined; in the Most-Teplice basin, 77 per cent of the total lignite was extracted. Principally at Roudny, 983,960 tons of iron were mined. Other mines yielded gold, lead, copper, rock-salt, and graphite. The total number of workers in mining in 1919 reached 130,000. The petroleum region, extending along the Carpathians and marking the continuation of the Galician fields, produced about 7000 tons annually. With these resources, the metallurgical industry was able to support 27 furnaces, 10 of them in Bohemia, the most important at Witkowitz and Kladno, with an annual capacity of 1,500,000 tons. In 1920, 709,890 tons of pig iron were turned out; in 1921, 543,100 tons. Steel production reached 917,662 tons in 1921. There were well known mineral springs at Karlsbad, Marienbad, Franzensbad, Teplitz, and the Chalybeate springs of Giesshübel and Bilin. Other plants, numbering some 8830 and employing 848,600 workers in 1919, concerned themselves with the manufacture of textiles, glass and precious stones, food articles, furniture, machines, metals, paper, and chemicals. The important centres were, for textiles, Reichenberg, Trautenau, and Brünn; china, Karlsbad; glass, Gablonz and Haida; chemicals, Aussig.

Commerce. Imports in 1921 reached a value of 22,435,000 crowns; in 1922, 12,695,000,000 crowns; and in 1923 they were 10,129,000,000 crowns. Exports for 1921 and 1922 were 27,312,000,000 crowns and 18,086,000,000, declining to 12,518,000,000 in 1923. The principal exports were glass, finished textiles, fuel, and sugar; the imports were raw textiles, food-stuffs, and iron. The greatest volume of im-

ports came from Germany, which, in 1922, sent 44 per cent of the total. Others participating were the United States, 71 per cent, and Austria, 68 per cent. Proportions of exports, in weight, by countries of destination in 1922 were Germany, 42 per cent; Austria, 31 per cent; Hungary, 9 per cent. Imports from the United States for 1922 (six months) were valued at 1,305,932,000 crowns, and exports at 609,025,000 crowns. Again, exports to the United States amounted to \$16,606,242 in 1922, compared with \$8,318,596 in 1921. Throughout 1922 and 1923, the export of manufactured goods showed marked decline; this was due largely to the appreciation of the crown and to labor troubles, and also to the number of commercial treaties effected by which England, France, and the United States received favored-nation treatment.

Communications. On Jan 1, 1922, there were 8717 miles of railway in the state, of which 5305 miles were government owned. In July, 1923, the government acquired the Bustchrad railway, the last privately owned line of importance. From 1920 on, the government applied itself to the projection of a system of lines connecting east and west. The programme called for the construction of 15 new lines, 558 kilometers in length, of which 389 kilometers were to be in Slovakia, and the rest, of lines connecting Slovakia with the west. The plan included the building of a railway through the centre of Slovakia, leading from Veseli on the Moravia River to Marmarosska Sihot. There were 265 miles of navigable waterways on the Elbe and Danube Rivers. The former connected the country with Hamburg and the North Sea, and the latter with the Balkans. Pressburg was the chief port on the Danube and its terminal developments were being rapidly pushed. By the Treaties, Czecho-Slovakia was given the right to use certain wharfs in the ports of Hamburg and Stettin. The country had 73,600 miles of telegraph line and 138,482 of telephone line in 1921.

Finance. In 1922, the debts of the state were internal state loans, 6,807,550,300 crowns; from regulation of the currency, 8,262,702,035 crowns; foreign loans, 8,740,275,998 crowns; total, 23,870,528,333 crowns; debts imposed on the republic, 16,250,000,000 crowns, comprising 6,500,000,000 crowns of pre-war debt and 9,750,000,000 crowns for reparations; the grand total of debt was 40,120,528,333 crowns, or \$968,950,000 at average exchange for 1922 (\$0.24151). In the budget for 1923 receipts were estimated at 18,812,390,860 crowns (\$587,887,000, at \$.03125) and expenditures at 19,377,880,639 crowns (\$605,559,000). Revenues came from direct taxation, indirect taxation, government monopolies, and state enterprises. On the service of the debt, the 1923 budget carried 2,790,225,194 crowns. In December, 1919, 6,621,000,000 crowns were in circulation, against a metallic reserve of 86,000,000 crowns; in December, 1922, notes in circulation were 10,064,000,000, against a reserve of 818,000,000, while in April, 1924, notes in circulation totaled 7,654,000,000 crowns, the lowest figure since 1919. The total reserves at the beginning of 1924 were 3,464,000,000 crowns.

Economic Conditions. The country was steadily marching to a greater stability, presenting the only pleasant relief in a Central Europe otherwise characterized by hopeless in-

flation, disorganized economic life, and widespread unemployment. Whereas the crown in 1918 was worth about \$.01, it had gone up to \$0.15 in January, 1922, and by January, 1923, it had reached \$0.125. Retail prices fell, too. Based on the index number 100 for 1914, necessities, i.e. foodstuffs, fuel, and clothing, were at 2488 in January, 1921. at 1760 in January, 1922; at 1029 in December, 1922; and at 972 in May, 1923. On the other hand, wages ranged between 9 and 12½ times the pre-war rate. From 1919 to 1921 unemployment regularly dropped, falling from 260,000 to 100,000. However, the industrial crisis of the ensuing year raised the total of men out of work to 400,000, so that by February, 1923, 200,000 men were receiving unemployment doles. The reaction was due to the setback which industries supplying foreign markets received with the appreciation of the currency. A recovery was manifesting itself in 1923 as foreign buyers once more returned to Czecho-Slovakia because of the high cost of living in Austria and disturbed conditions in Germany. In the field of social legislation the government's attitude was enlightened. Within the years 1918-24, legislative provision was made for accident and sickness insurance codes, maternity insurance, a limited form of old age pensions, an eight hour day, prohibition of night work for women and children in industry, housing legislation, an equal legal status for women, and a limited form of workers' councils in mines and factories. Trade-union members numbered about 1,400,500 workmen in 1920; the largest groups were the Czecho-Slovak Federation of Trade Unions, with 822,520 members, and the Bohemian Labor Committee, with 352,608. Labor troubles were not wanting, with so large a proportion of the population organized. In 1918, 139 strikes involved 343,752 workers; in 1920, 1491 strikes brought out 1,675,321 workers. In December, 1921, occurred a general strike which lasted three days and involved 162,100 men.

History. That Czechs, whose dreams of national independence had been kept alive since their defeat at the battle of the White Mountain in 1620, should look on the outbreak of the War with misgivings and should render its prosecution only a lukewarm support was to be expected. Their leaders had openly identified themselves with Pan-Slavism; victory for the Central Powers would mean submergence of their racial aspirations. But that resentment should be so violent as to take the form of wholesale desertions had presumably never occurred to the Austrian bureaucracy. It is estimated that voluntary surrenders of Czechs to Serbs numbered 35,000 in 1914 alone; 300,000 surrendered to Russians and 30,000 to Italians during the war period. Retaliatory measures were therefore extreme. Czech civilians interned numbered 25,000; 5000 were sentenced to death by courts martial; attempts were made to force submission by the imprisonment of the womenfolk of absent Czech patriots; papers were suppressed, the Slav societies dissolved, and German installed as the official language in Bohemia. Magyar activities in Slovakia were even harsher. Driven underground, Slovak resistance took the form of a secret society, the Mafia, which kept up a steady stream of communications with leaders abroad, maintained a secret intelligence, and practiced successfully

an economic and military sabotage. The outside world was apprised of the struggles of the people for independence by the Czecho-Slovak National Committee at Paris, and the work of the outstanding national leaders, the Czech Masaryk and Beneš, and the Slovak Stefanik. Firstfruits of their labors appeared when the liberation of the Czecho-Slovaks was included in the statement of the Allies' war-aims on Jan. 10, 1917, the next development was Czech spokesmen's audacious championing of their causes of historic rights and national self-determination in the first Austrian Parliament called since 1914, on May 30, 1917. On Jan. 6, 1918, at Prague, a convention of all the leaders of the Czecho-Slovak world met and openly made demands for a sovereign state and the liberation of Slovaks from Magyar exploitation. Other such congresses, at Prague, April 13; at Rome, April 8-10, and again at Prague, May 16, made it plain to the Allies that the subject races of the Dual Monarchy were one in demanding liberation. Other evidence of the wholeheartedness with which Czecho-Slovaks were ready to give proof of their support of the Allies' purposes was furnished by their equipping troops for the Allies' armies. The most important Czech unit was the corps formed of Czech prisoners in Russia after the revolution. This took part in the fighting on the eastern front in July, 1917, and then, after the collapse of the Russian army, undertook an astounding and almost mythical journey through the heart of Siberia in 1918 to join the troops on the western front. In the west, in December, 1917, a Czecho-Slovak unit was recognized; on the Italian front, the same steps were taken. Beginning with the summer of 1918 one after another of the Allies recognized Czecho-Slovakia as of their number and the National Committee as its *de facto* government; the United States did so on Sept. 3, 1918. On October 7, the Dual Monarchy formally accepted President Wilson's statements as a basis for negotiation; on October 14, Beneš announced the establishment of a Czecho-Slovak government, and its principles were promulgated on October 18; on the same day President Wilson declared to Austria-Hungary that no negotiations could be undertaken without the recognition of Czecho-Slovakia's and Jugo-Slavia's independence; on October 17, Andrassy accepted for the Dual Monarchy and in so doing dealt Austria-Hungary its deathblow. Czecho-Slovakia was now a European state. Its first national assembly met at Prague, Nov. 14, 1918, welcomed the Slovak delegates, elected Masaryk first president by acclamation, and set up a cabinet with Dr. Kramar as premier and Dr. Beneš as foreign minister. Also, Dr. Kramar and Dr. Beneš were delegated to represent the country at the Peace Conference. The conflicting claims of self-determination and historic rights have already been alluded to: in these centred the leading difficulty before the Peace Commissioners with respect to Czecho-Slovakia. The old Czech kingdom had included the whole of the provinces of Bohemia, Moravia, and Austrian Silesia; within these there were now 3,500,000 Germans, constituting 37 per cent of Bohemia's population, 28 per cent of Moravia's, and 44 per cent of Silesia's. It was therefore with some hesitation that the Supreme Council decided to yield to the demand for historic justice, instead of racial, and created a state em-

bracing so great a number of a minority and antagonistic people. Ample grounds were to be found for the decision: the Czechs had after all come to the country first, while the Germans had been colonized there; the boundaries had to be kept intact for strategic reasons; economic considerations, such as the convergence of the rivers toward the centre of the country, and German Bohemia's being an industrial centre and thus serving to complement the agricultural districts of the rest of the country, favored the move. In the case of Slovakia, historic rights were ignored in favor of Czecho-Slovak claims, and the Danube was accepted as the southern frontier in spite of large Magyar minorities on the left bank. In Ruthenia, of 572,028 inhabitants 319,361 were Ruthenes, 169,434 Magyars, 62,187 Germans, and only 4057 Slovaks, and the request of certain delegates of Ruthenians resident in the United States for union with Czecho-Slovakia was far from convincing; but as the Allies wished to establish direct territorial contact between Czecho-Slovakia and Rumania, and above all to prevent the future union of so strategically important a region as Carpathian Ruthenia with Russia or Ukraina, ethnic ties were violated, and the area was assigned to Czecho-Slovakia, with treaty stipulations for autonomy, a separate diet, and the retention of the Ruthene language. Only in the Teschen (q.v.), Zips, and Orava areas, in the north, was the boundary left undetermined; the Treaty provided for plebiscites there. The Czecho-Slovak commissioners also effected the internationalization of the Elbe, the use of free zones in the ports of Hamburg and Stettin, and the reconstitution of the European Commission of the Danube.

The National Assembly continued to sit until the framing and adoption of the new constitution, Feb 29, 1920. This document, which showed largely the American and French influence, provided for a president, a parliament of two houses, and a judiciary somewhat on the American plan. The president was to be elected for seven years by both houses in joint session, was to represent the republic in its international relations, to head the army, and to have the power to summon, prorogue, and dissolve Parliament. He did not have the right of veto. Both chambers were to be elected by universal manhood and womanhood suffrage, on the basis of proportional representation. The Chamber of Deputies was to have 300 members; the Senate, 150. Declarations of war and amendments to the constitution might be passed only by a three-fifths vote of all the members of both houses. Finance and army bills were to originate in the lower house. Cabinet ministers, 15 in number, were to be appointed by the president and to be responsible to the Parliament. During the intervals between sessions, a permanent parliamentary commission was to exercise the legislative power. A constitutional tribunal was to pass on the constitutionality of laws; there were to be special benches in the case of litigation in mining matters; and industrial courts were provided for labor disputes. In the elections of April, 1920, parties returned were as follows (first figure for Chamber, second for Senate): Social Democrats (Centre Socialists), 74 and 41, from whom 22 deputies and 5 senators broke away to form a Communist wing; Na-

tional Socialists (Right Socialists), 24 and 10, the Popular party (Catholics from Moravia and Slovakia), 33 and 18; Czecho-Slovak Agrarians, 28 and 14; Slovak Agrarians, 12 and 6; National Democrats (Liberals), 19 and 10; German Social Democrats, 31 and 16. German Electoral Union, 15 and 8; German Agrarians, 11 and 6; German Christian Socialists, 10 and 4; Magyar parties, 10. The vote, by nationalities, was 4,203,480 Czecho-Slovaks, 1,576,692 Germans, 274,630 Magyars. V. Tusar (Social Democrat) succeeded Kramář (National Democrat) and formed a ministry on July 8, 1919; on Sept 15, 1920, Tusar was followed by Jan Černý (National Democrat) as a result of the split in the Socialist party. Beneš (Independent) succeeded on Sept. 26, 1921, on Oct 8, 1922, he was followed by A. Švehla (Agrarian). In all these cabinets, the portfolio of foreign affairs was held by Dr. Beneš. The cabinets included representatives of all the Czecho-Slovak parties except the extreme left. The problems confronting the leaders of the young state were indeed grave. To begin with, food and clothing were scarce, the cost of living high, the coal shortage serious, the rate of exchange unfavorable, and the transportation system, because of the studied plan of Austria-Hungary, hopelessly inadequate. The first budget showed a marked deficit and conditions of life were far from normal. But the economic snare slowly disentangled itself so that from 1922 on Czecho-Slovakia presented the pleasant spectacle of a country at work, with high wages, and an appreciating currency. The well-being of the workers and Agrarian laborers was zealously provided for in elaborate codes of social legislation. Cultural problems were perhaps more complex and less easy of solution. The subject of the racial minorities cut deeply. In the first place, Czechs and Slovaks were not brothers, as their common name might imply, but rather distant cousins, and the superior attitude of the Czechs did not enhance Czecho-Slovak solidarity. During 1919-24, dissatisfaction was evident, Slovaks complained of espionage and censorship and of the de-industrializing of their country; even the Magyar overlordship was deemed more desirable by many. By 1924 it was plain that an autonomist movement had made considerable headway. Too, the Germans, the most cultivated and industrialized of the races residing in the country, were treated harshly; attempts were made to Slavonize them; their officials were removed; communes were split up to eliminate the preponderance of the minority race; Germans, and Magyars too, were hard hit by the land expropriation in favor of the Slavonic small farmer. As for Ruthenia, not until March, 1924, were elections held in the province for the selection of National Assembly representatives. Dissatisfaction was grounded on cultural neglect. Nothing revealed the complex character of the Ruthenian problem better than the fact that 13 parties contested for the eight seats. Another cause for internal dissension lay in the marked regional differences. In Bohemia and Moravia the standard of education was high and there were few illiterates; but in Slovakia, as a result of relentless Magyarization, literacy was low, primary schools were few, and up to 1918, there were no secondary schools; and in Ruthenia, as a result of the same policy, the illiterate population included

75 per cent of the total. In religious circles, another discordant element manifested itself. In 1920, as a result of the "Away from Rome" movement, which contended for such changes in Roman Catholic practice as abolition of celibacy, the use of the vernacular in church services, and a more democratic church administration, all of which the Pope naturally refused to countenance, dissatisfied bodies founded the Czecho-Slovak Church. By the 1921 census, 120 churches and 525,313 communicants were recorded. The political significance of the act lay in the fact that the Church was being supported by the Czechs, while the Slovaks, who were the most pious Catholic peasantry of Europe, regarded it with hostility.

The foreign policy of Czecho-Slovakia was perforce bold, in view of the new nation's situation as a landlocked state almost surrounded by a cordon of hostile neighbors. In its international relations it was guided by two principles, the maintenance of friendly relations with the Entente and with France first and then with Italy, and the creation of a group of conventions with the succession states of Austria-Hungary for the preservation of the status quo. With the aid of France the military establishment was perfected, in 1921 a military accord between the two powers was formed; on Jan. 25, 1924, after lengthy pourparlers between Poincaré and Masaryk and Beneš, a political alliance with important implications was signed. This included a pledge on the part of both nations to maintain the peace treaties and to prevent a Habsburg restoration; promises of mutual support, but without definite military commitments; the upholding of the League of Nations; arbitration in the case of disputes, and a new commercial convention. Though Beneš succeeded in convincing Great Britain that the intent of the treaty was pacific, by Germany and Italy the whole was regarded with suspicion, while Austrian and Hungarian comments were plainly querulous. Again, the creation of the Little Entente in Central Eu-

rope was largely the work of Beneš. By a series of bilateral conventions formed in 1920 and 1921, Czecho-Slovakia, Jugo-Slavia, and Rumania united to preserve the peace in Central Europe, to further the maintenance of normal economic relations, and to block consistently all attempts at reaction, in Hungary and Austria particularly. (For the character of the alliance and its achievements, see *LITTLE ENTENTE*.) A political convention of a similar nature was signed with Poland in 1921. Thus, Czecho-Slovakia regarded with suspicion all attempts at a Habsburg restoration in Hungary; it objected, too, to the proposed union of Austria and Germany, or a Danubian confederation. In the field of commercial relations, treaties and trade agreements were concluded with almost all the country's European neighbors and with the United States on the basis of the most-favored-nation clause. In Russian political affairs, Beneš steadfastly refused to intervene, but in 1921 unofficial missions were exchanged between Russia and Czecho-Slovakia, and on June 5, 1922, a commercial agreement similar to the Anglo-Russian arrangement was concluded, opening the vast but disorganized Russian market to Czech enterprise. In September, 1923, Czecho-Slovakia was elected as one of the smaller nations to be represented in the League of Nations Council. In May, 1924, another important link in Czecho-Slovak international relations was forged when a treaty of amity was signed between Beneš and Masaryk for Czecho-Slovakia and Mussolini for Italy. It pledged both countries to the observance of the Peace Treaties and both promised to employ their good offices in the event of a dispute between either signatory and a third power and even to consider acting in concert in the case of war with a third power. This action, like so many others, during 1923-24, seemed to mark a new orientation in Central European politics, with Italy as the centre of the system rather than France. See also *TESCHEN*, *ZIPS*, AND *ORAVA QUESTIONS*; *SLAVONIC LITERATURE*.

D

D'ABERNON, EDGAR VINCENT. See ABERNON, EDGAR VINCENT D'.
DAEGER, ALBERT THOMAS (1872-). An American bishop, born at New Vernon, Ind., and educated at Saint Francis College, Cincinnati, and in several houses of the Friars Minor. He was ordained to the Roman Catholic priesthood in 1896, and from that time until 1919 was connected with various churches in Missouri, Nebraska and New Mexico. In 1919, he was consecrated Archbishop of Santa Fé, N. M.
DAFOE, JOHN W. (1866-). A Canadian journalist (see VOL. VI). In 1919, he was the representative of the Canadian Department of Public Information at the Paris Peace Conference.

DAHLGREN, ULRIC (1870-). An American zoölogist born in Brooklyn, N. Y. He was educated at Princeton University, and was instructor in biology (1895-99), assistant professor (1899-1911), and professor of biology (1911-) at Princeton. In 1921 he was director of the Harpswell Marine Laboratory. Professor Dahlgren published (with Kepner) *Principles of Animal Histology* (1908), *Production of Light by Organisms* (1915), and various shorter papers mostly on electric and luminous organs of fishes.

DAHOMÉY. A French colony on the west coast of Africa between Togoland and British Nigeria, forming part of the Government General of French West Africa. Its area is 42,460 square miles, and its population in 1921 was 842,243 of whom 538 were Europeans. The capital and chief business centre was Porto Novo, with an estimated population of 20,000. Other cities are Abomey, 12,372; Whydah, 13,000; and Kotonu, 2456. Palm kernels and palm oil remained the products of greatest economic value. Cotton cultivation was successfully introduced in the central provinces, 1914-24. Imports in 1921 were 39,255,747 francs and exports 36,637,787 francs. In comparing these with the 1911 imports of 19,524,531 francs and exports of 21,958,301 francs, account should be taken of the fall in value of the French franc during the period 1914-21. In 1921, 248 vessels of 680,740 tons entered the country's ports. Germany's share of the palm kernel trade was largely absorbed by Great Britain after the War. In 1922 the local budget balanced at 8,960,000 francs. The natives remained orderly during the War, and many served in the carrier contingents doing duty in Europe and the Cameroun.

DAIL EIREANN. See IRELAND.

DAINGERFIELD, ELLIOTT (1859-). An American painter (see VOL. VI), head of Permanent Art School, Blowing Rock, N. C. His work, as exemplified in "An Arcadian Huntress," is pervaded with poetic meaning. Among his later pictures, "The City That Never Was" and "Tower of Silence" were imaginative impressions of the Grand Canyon. In 1914, he published *Ralph Albert Blakelock*.

DAIRYING. The decade 1914-24 was marked by advancement in dairying. The public was better educated to a more complete realization of the food value of dairy products, and consumption was consequently stimulated. The producers and dealers came to exercise greater sanitary precautions in the production of milk and in the manufacture of its products. Pasteurization became almost universal in the milk supplies of the larger cities, the ordinances of many of the cities allowing no raw milk to be sold. This condition tended to reduce the spread of contagious diseases, liable to be transmitted in milk. The manufactured dairy products became better known and more fully appreciated by increased advertising and by marketing products of more uniform quality and in a more attractive way. A wider use of brand names to denote slight differences in the products was also employed. Cheese and ice cream consumption was tremendously increased in this way. It has been suggested that prohibition also played a part in the increased use of ice cream and milk drinks. United States Department of Agriculture estimates of the per capita consumption of dairy products expressed in terms of whole milk were in 1919, 831 pounds, rising to 950 pounds in 1922, with estimates of a still greater consumption during 1923.

The development of coöperative and other organizations of milk producers during this period brought more independence in transactions with milk dealers and the receipt of better prices for milk. The first real stand of the dairymen against the dealers occurred in October, 1916, when the Dairymen's League of New York State declared a strike pending the adjustment of milk prices for the ensuing six months' period. The dairymen were essentially victorious after a spirited contest, and since that time many coöperative organizations have grown rapidly and now control large businesses, some of them going so far as to buy milk plants and to manufacture various types of dairy products. Along with the development of coöperative marketing associations, producers have also progressed profitably in the development of cow testing associations, bull associations, etc. Such progress made it possible to distinguish the profitable from the unprofitable cow and has served to demonstrate the importance of high producers. The bull associations have made it possible for owners of small herds to obtain the use of better bulls at a reasonable cost. Pure-bred sire campaigns and advanced registry testing in the different breeds of pure-bred dairy cattle also showed much progress. The increases in the cost of labor and feeds occurring during the War made it absolutely necessary to produce milk as efficiently as possible, and also furnished a legitimate excuse for increased milk prices. A decrease of from 30 to 50 per cent in feed prices during 1920, however, without any great reductions in milk prices, left the milk producer in a better posi-

tion than he had enjoyed for many years. Much interest was evidenced not only by the dairy industry but by the public in general in the World's Dairy Congress, which was held in the United States in October, 1923, and attended by 231 representatives from 43 foreign countries and 1590 delegates from 47 of the States. Two hundred and fifty-six papers were listed on the programme dealing with national health, regulation and control, research and education, and industry and economics. This congress, held in conjunction with the National Dairy Exposition, was a great success.

International Trade. A very significant change occurred in the world's market for dairy products. The Danes had before the war developed their system of butter production to supply the winter market of the United Kingdom, but a vast development of dairying in the Southern Hemisphere tended to furnish an ample or oversupply of butter to this market in the winter, and as a result of the War a shortage occurred in the summer, due to the cutting off of the supplies from Russia, the second largest exporter of butter before the War, and a great reduction in those from France and other European countries. Offsetting Russia in a sense, however, was Germany, which before the War imported over 100,000,000 pounds of butter annually and which since the War used butter substitutes extensively and imported only negligible quantities of butter. During the first nine months of 1923, 56 per cent of the butter and 59 per cent of the cheese imported by the United Kingdom, the largest importer of dairy products in the world, were from the Southern Hemisphere, as compared with 21 per cent of the butter and 40 per cent of the cheese in 1914. The greater part of the increased dairying in the Southern Hemisphere appeared in New Zealand, Australia, Argentina, and South Africa. The British butter market was promising for those countries of Northern Europe with dairy resources, such as Finland, Estonia, Latvia, and Lithuania. The British cheese market was not so much disturbed as the butter, since the cheese imports from New Zealand and Canada were complementary as to seasons of production and approximately equal in amount.

The foreign trade of the United States underwent very marked changes, due to an unusually large demand for dairy products by the belligerent countries of Europe, where many dairy cattle were slaughtered or not fed for maximum production. The summer butter shortage in the British markets also caused some flurry in American markets. It was problematical as to whether it would be more advantageous to ship fresh butter to the British market or hold it in storage for the home winter market despite the depreciation of quality from keeping. Very little American butter was shipped, however. The table below, giving the annual exports and imports of butter, cheese, and canned milk of the United States during 1913-23, shows how variable the international trade in these products was. A marked reduction in the foreign demand for canned milk due to the initial recovery in Europe in 1920 threatened a serious situation, but many of the condensing and evaporating plants turned to making butter and cheese when the first signs of flooding the markets were evident.

It is of interest to note the influence of the

amounts of dairy products exported from the United States to the United Kingdom on the total exports of the United States as given in

* Quantity not given in Commerce reports of the United States.

the table. The changes in the amounts of butter sent to the United Kingdom as compared with the preceding years were, in round numbers, for the years showing the greater fluctuations: in 1917, decrease of 17,000,000; 1918, increase of 20,000,000; 1920, decrease of 18,000,000; 1921, decrease of 3,750,000; 1922, increase of 3,500,000; and 1923, decrease of 3,250,000. The large reduction in the total exports of cheese of 34,000,000 pounds in 1919 was accompanied by a reduction of 38,000,000 pounds in the amount exported to the United Kingdom. Likewise the fluctuations in the exports to Great Britain played a large part in the total fluctuations in the exports of canned milk. In 1916 the United Kingdom took 106,000,000 pounds of condensed, evaporated, and powdered milk from the United States, but in 1919, the year of the largest exports of canned milk, the United Kingdom received 421,000,000 pounds, but in 1920 the exports to the United Kingdom dropped to 124,500,000 pounds and have not since reached 74,000,000 pounds in one year. Exports to Belgium and France also reached a high total in 1919 of 176,000,000 pounds, which dropped to 77,000,000 in 1920 and 28,000,000 in 1921. Exports of canned milk to Germany reached a high mark in 1921 of nearly 61,000,000 pounds, which dropped to about 31,500,000 in 1922 and 1923. Cuba's consumption of canned milk was relatively large, being over 30,000,000 pounds annually from 1916 to 1921 and 19,000,000 and 28,000,000 pounds, respectively, in 1922 and 1923.

The table shows that the War acted as a great stimulus to the production and export of all dairy products from the United States, more especially canned milk and cheese. Previous to the War the United States was importing over

55,000,000 pounds of cheese annually, whereas in 1917 only a little over 6,000,000 pounds were imported. American exports of cheese were likewise affected. Previous to the War less than 4,000,000 pounds was exported annually, but in 1915, 1916, and 1917 over 50,000,000 pounds were exported annually. The temporary character of this change in the exports, especially of cheese, is shown by the fact that the amount returned to 5,000,000 pounds in 1922 and a little over 8,000,000 in 1923, and at the same time the imports were 46,500,000 and 64,500,000 pounds respectively. The imports of cheese, which before the War came largely from Italy and Switzerland, were almost entirely cut off during the War. Argentina sent a large part of the cheese imported; from this source came nearly 10,000,000 pounds in 1920. The export of a little less than 200,000,000 pounds of canned milk during 1922 and 1923 indicated that this market also had again reached somewhat of a stable condition.

Research. The progress of research in dairying had gratifying results. As the importance of vitamins was better understood, the need of including them in the rations of dairy animals became apparent. The vitamin content of dairy products was forcibly brought out in 1918 by studies at Yale University and at the University of Wisconsin. Work on the importance of minerals in the rations of dairy cattle was intensively carried on by E. B. Forbes at the Ohio Experiment Station, E. B. Hart at the Wisconsin Experiment Station, and E. B. Meigs of the United States Department of Agriculture. These investigations tended to show the difficulties of keeping cows producing large amounts of milk in a positive calcium balance, even when plenty of calcium was supplied in the ration. The significance of the legumes, more especially alfalfa, as an aid to the maintenance of a positive calcium balance was first suggested from the Wisconsin Station and was later corroborated by other investigators. The proper curing of the alfalfa used is essential to prevent the partial or entire destruction of the substance which aids calcium assimilation. Investigations in the manufacture of dairy products progressed along bacteriological lines. The isolation in the United States Department of Agriculture of organisms necessary for the production of different types of fancy cheese which it was thought necessary to import previous to the War, and a study of the temperature and humidity requirements for ripening such cheeses, have made it possible to produce cheese in this country closely resembling many imported types. The influence of different strains of bacteria in butter making has been extensively studied at the Iowa Experiment Station, and some success has accompanied attempts to separate strains of organisms which are morphologically and characteristically very similar and which have been found to operate in the production of varied flavors.

The Illinois Experiment Station conducted a series of studies dealing with the thoroughness of different methods of sterilizing utensils and tests of the numbers of bacteria added to the milk through improperly cleaned utensils. Other investigations from the Illinois Station have tended to demonstrate the relative influence of different operations and methods of performing them on the bacteria added to the milk during milking and the handling of the product.

The New York State Experiment Station at Geneva has revealed interesting effects of milking machines on the bacterial count of milk, and has made an extensive study of different methods of sterilizing and cleaning parts of these machines.

Bibliography. Recent important reference books published in the decade 1914-24 are: C. H. Eckles, *Dairy Cattle and Milk Production* (New York and London, 1923, rev. ed.); E. S. Savage and L. A. Maynard, *Better Dairy Farming* (Ithaca, N. Y., 1923); A. C. McCandlish, *The Feeding of Dairy Cattle* (New York and London, 1922); P. G. Heineman, *Milk* (Philadelphia and London, 1919); T. Mojonier and H. C. Troy, *The Technical Control of Dairy Products* (Chicago, 1922); E. Kelly and C. E. Clement, *Market Milk* (New York and London, 1923); M. Mortensen, *Management of Dairy Plants* (New York, 1921); O. F. Hunziker, *The Butter Industry* (LaGrange, Ill., 1920); G. L. McKay and C. Larsen, *Principles and Practice of Butter Making* (New York and London, 1922); C. Thom and W. W. Fisk, *The Book of Cheese* (New York, 1918); O. F. Hunziker, *Condensed Milk and Milk Powder* (LaGrange, Ill., 1920); W. W. Fisk, *The Book of Ice Cream* (New York, 1919).

DALLAS. The leading wholesale market and manufacturing centre of Texas and the home of the Federal Reserve Bank of the eleventh district. Its population increased by 72.6 per cent in 10 years, from 92,104 in 1910 to 158,976 in 1920, and to 177,274 by estimate of the Bureau of the Census for 1923. The value of building permits issued increased from \$3,422,512 in 1915 to \$20,988,469 in 1923, bank resources from \$43,399,920 to \$152,914,761; deposits from \$30,187,466 to \$128,829,981; and bank clearings from \$256,200,598 to \$1,805,414,000. The factory output of Dallas increased from \$31,065,000 in 1914 to \$93,650,000 in 1919; in 1923 the wholesale business was estimated by the Chamber of Commerce at \$700,000,000 and the retail business at \$250,000,000. A \$6,600,000 Union Station and terminals and a \$1,000,000 interurban station were built during the decade. Engineers were at work in 1924 on plans for a new water supply project, to be built by a \$5,000,000 bond issue voted in 1922.

DALLIN, CYRUS EDWIN (1881-). An American sculptor (see VOL. VI). He has in recent years continued his impressive Indian subjects in such works as "The Hunter" (1915), Arlington, Mass.; "Massasoit" (1921), Plymouth, Mass., and "The Last Arrow" (1923). He has succeeded also in the domain of historical sculpture in works like "Anne Hutchinson," State House, Boston, and the impressive relief, "Signing the Compact," Provincetown, Mass.

DALMAN, GUSTAF HERMANN (1855-). A German Orientalist, professor of Old Testament Exegesis at the University of Greifswald (see VOL. VI). In 1917, he was appointed professor in the University of Greifswald, and in 1918 he became *Geheim-Konsistorial-Rat*. His works published since 1914 include: *Die Kapelle zum heiligen Kreuz und das heilige Grab in Göttingen und in Jerusalem* (1915); *Orte und Wege Jesu* (1921); *Das Grab Christi in Deutschland* (1922); and *Jesus-Jeschua. Die drei Sprachen Jesu. Jesus in der Synagoge, auf dem Berge, beim Passahmahl, am Kreuz* (1922).

DALMATIA. See FIUME-ADRIATIC CONTROVERSY.

DALRYMPLE, LEONA (MRS. C. ACTON WILSON) (?-). An American author. In 1914, she won a prize of \$10,000 for her novel, *Diane of the Green Van*. Among her other stories are: *Traumerei* (1912); *The Lovable Meddler* (1915); *Jimsy, the Christmas Kid* (1915); *When the Yule-Log Burns* (1916); *Kenny* (1917); "Paul" stories (1920). She also wrote short stories for magazines, and moving picture scenarios.

DALTON, ALBERT CLAYTON (1867-). An American army officer, born at Lafayette, Ind. He entered the United States Army as a private in the 25th Infantry in 1889 and was promoted second lieutenant two years later, and by successive advancements became brigadier-general in the Quartermaster's Department in 1922. His services included participation in the campaign against the Cheyenne Indians in 1890 and in that against the Sioux in 1891; and in the Santiago campaign in 1898 as well as those in the Philippines during 1899-1902, and that on the Mexican border in 1916-17. During the War he organized the Army Transport Service from New York (1917-18) and in 1919 he was in France commanding the 9th Division. He is a graduate of Infantry-Cavalry School (1895), the General Staff School (1920), and the Army War College (1921).

DALTON LABORATORY PLAN. See EDUCATION IN THE UNITED STATES.

D'ALVIELLA, COUNT GOBLET (1846-). A Belgian legislator, writer, and minister of state (see VOL. VI). During the War he was a member of the Belgian cabinet. He received many medals and other decorations, both Belgian and foreign, for his services. He published *The True and the False Pacifism* (1917).

DALY, THOMAS AUGUSTINE (1871-). An American writer born in Philadelphia, Pa. He was educated in the public schools and at Villanova College, Pa., and also was in Fordham University to the close of his sophomore year. He received honorary degrees from Fordham University, Notre Dame University and Boston College. He was associated with several newspapers, among them the *Catholic Standard and Times*, Philadelphia, and the *Evening Ledger and Philadelphia Record*. He is the author of the following books: *Canzoni* (1906); *Carmina* (1909); *Madrigali* (1912); *Little Polly's Pomes* (1913); *Songs of Wedlock* (1916); *McAroni Ballades* (1919).

DAMASCUS. See SYRIA.

DAMS. With greatly increased needs for large and constant water supplies for municipal purposes, for irrigation, and for power, as well as to provide adequate flood control and protection, the design and construction of dams received considerable attention among civil engineers between 1914 and 1924. With increased costs of fuel and greater demands for power, it was realized that more and more the natural power resources of the world must be utilized, and that mountain streams and other available sources must be conserved and transformed into reservoirs by suitable dams so that water at suitable head and in adequate amount could be obtained for power purposes. See WATER POWER.

There was an increased tendency in the United States, as well as in Europe, to secure and enforce state or national supervision for dam design and construction, as it was found almost always in the case of the failure of dams and

disastrous damage to life and property to the valleys below that faulty design or construction was responsible. After the War private capital was all the more anxious to develop power schemes under the terms of the Federal Water Power Act. In the case of streams either under United States control, or under various local statutes or regulations for streams not subject to Federal supervision, it was realized that sound design and construction were essential to maintain the integrity of the investment, as well as to conserve the safety of the valley below, and for this reason engineers were devoting more attention to design.

The height of dams gradually was being increased and for structures with record heights additional attention had to be paid to the foundations and footings as well as to the main construction. Particularly was this the case where a mountain gorge had to be closed by a masonry dam of unusual height and here important problems had to be solved. On the other hand where there were dams of considerable length, as for example, the Wilson Dam at Muscle Shoals, the undertaking was rather more simple though involving construction work of considerable volume. Where possible earth dams were being employed in greater amount and of greater size, and here the provision of suitable cores and other features was absolutely essential. These earth dams could be built rapidly by hydraulic fill, but they presented problems no less than other types of construction.

Arch Dam Investigation. In 1922 in the United States the Engineering Foundation put under way a practical study and investigation of arch dams in order to learn as much as possible about their characteristics and performances in different conditions and temperature of depth of water in the reservoirs. The arch dam was selected by the Engineering Foundation as a subject of special importance on account of its use in connection with water power development and irrigation and water supply projects, particularly in the western states of the United States and in similar regions in other countries. In this type it was possible to secure the necessary strength to resist the pressure of the water or of ice with less masonry than was required for the other common type of masonry dam known as a gravity dam which resisted the pressure of the water and other forces chiefly by its weight.

For the systematic investigation of arch dams, the committee appointed by the Engineering Foundation in 1924, proposed to build a test dam 60 to 100 feet high, which was to be tested repeatedly during construction and under different conditions, and finally to destruction. The site selected was in Stevenson Creek, a tributary of the San Joaquin River, about 60 miles east of Fresno, California. This site was in conjunction with a U-shaped section, typical of many dam sites, and a stream gradient of about 25 per cent. It afforded a suitable foundation without an undue amount of stripping and was convenient and accessible. There was adequate water available derived from a tunnel from Shaver Lake which passed near by so that the reservoir formed by the test dam could be filled at will. This reservoir was not so large as to imperil life or property in case of the actual failure of the structure.

Wilson Dam. The Muscle Shoals project to develop power by a dam across the Tennessee

River was an important war time undertaking put under way in 1918. The Wilson Dam—Dam No. 2 across the Tennessee—was a structure of the overflow type about 4600 feet in length from bank to bank, and about 96 feet high from bed rock to pool level. It not only would supply power but would render adequate depth of water for navigation of the Tennessee River. The dam was founded on solid rock with two tandem locks excavated in solid rock, 60 feet wide by 350 feet in length at the north end of the dam, each giving a lift of about 45½ feet and affording a minimum depth over mitre sills of 7½ feet. The spillway section of the dam shown to the right of the lower half of the accompanying plate is 2660 feet in length, and over its crest rise 8-foot piers which support a concrete arch bridge. In the 58 openings between the piers are vertical steel sliding crest gates 18 feet high and 38 feet wide, which are sufficient to pass a flood 75 per cent greater than the highest ever known on the river without any appreciable rise in the upper pool level. The heel trench is 35 feet wide and is carried down below the base of the dam so as to give a minimum breast wall of five feet without any seams.

The power house proper is located in a section of the dam about 1200 feet long, which is a continuation of the spillway section and includes a building for housing the generating machinery. Here were to be installed at the beginning four 30,000-h.p. turbines, although power was available to generate from 300,000 to 375,000 h.p., and provision was made for a corresponding installation of turbines. This dam contains nearly 1,000,000 cubic yards of masonry and is one of the largest dams ever

River, California, about 250 miles east of San Francisco, and at an elevation greater by 3600 feet, there was built a straight cyclopean masonry gravity section dam 600 feet in length with a siphon spillway. From the crest of the dam to the lowest excavation it was 311 feet in height, and the dam rises to a height above stream level of 212 feet, there being an average excavation of 73 feet. See **AQEDUCTS**.

Don Pedro Dam. The highest arch gravity non-overflow type of dam in the world, and in fact one of the highest dams of any kind was completed in 1923, across the Tuolumne River in California. This dam, which was built on a simple curve with a radius of 675 feet and a height of 280 feet, is 1040 feet long on the crest and contains 282,000 cubic yards of concrete masonry. The spillway with a capacity of 100,000 second-feet was provided with 10 gates, each 58 feet long and weighing 22 tons. These gates sink into the lip when not in use and can be raised to increase the reservoir height by nine feet. There was also a power house built at the toe of the dam which was equipped for an initial capacity of 150,000 horse power. The Don Pedro Dam forms a reservoir four miles above the La Grange Diversion Dam for the joint use of the Turlock and Modesto Irrigation districts in the San Joaquin Valley, California. Its estimated cost was about \$4,000,000. The reservoir when full covers an area of 3068 acres, having a capacity of about 280,000 acre feet. This dam itself was located about 60 miles below the Hetch Hetchy Dam of the San Francisco water supply project.

Dams of U. S. Bureau of Reclamation. Some of the most important dam construction in the United States has been carried on by the

built as regards its volume. See **MUSCLE SHOALS**.

Gilboa Dam. The Gilboa Dam for the Schoharie development of the Catskill aqueduct of the New York City water supply system was a large gravity masonry structure for the overfall portion, 1300 feet in length with an earth portion with a masonry core 1000 feet in length. The masonry section has steps on the downstream side leading to a spillway channel along the toe of the dam for which earth portion there was a masonry core in the centre of heavy rock paving on the up-stream side. At the transition section the dam was flagged both up stream and down stream by a heavy masonry retaining wall to intersect the long slope of the earth section. This dam had a maximum height of 160 feet (see **AQEDUCTS**).

Hetch Hetchy Dam. On the Tuolumne

United States Bureau of Reclamation, and its engineers have developed designs in which most of the leading types have been represented, as will appear from the accompanying table giving a summary of United States dams over 50 feet built by the Reclamation Bureau. Up to the end of 1923 the Bureau had built three dams over 300 feet high, two dams between 200 and 300 feet, four dams between 100 and 200 feet, and nearly 100 dams ranging from about 2½ to nearly 100 feet in height. In 1924 there were six dams under construction, the most important of which were the Tieton River Dam in the State of Washington, with an estimated volume of 185,000 cubic yards, and a height of 244 feet (maximum height to the bottom of the core wall is 321 feet); the McKay Dam in the State of Oregon with an estimated volume of 2,300,000 cubic yards and a height of 159 feet; and

DAMS

THE WILSON DAM AT MUSCLE SHOALS, ALABAMA

A panoramic photograph showing the construction of this dam across the Tennessee River at Florence, Alabama. 4600 feet in length. The upper half of the plate shows the lock under construction on the right bank of the river, the nonoverflow section of the dam, a portion of the spillway, and Jackson's Island separating the two channels of the river. The lower half of the plate shows the remainder of the spillway dam and the power house section extending to the left bank of the river.

DAMS

THE GILBOA DAM IN COURSE OF CONSTRUCTION

Built across Schoharie Creek, New York, this dam forms a storage and diverting reservoir from which by the Shandaken Tunnel water will pass to the Ashokan Reservoir of the Catskill Water Supply of the City of New York

the Black Cannon Dam in Idaho with an estimated volume of 74,500 cubic yards and a height of 153 feet.

The Arrowrock Dam near Boise, Idaho, built by the United States Reclamation Service in the interval between 1910 and 1916, has a height of 349 feet, and is 1100 feet long on the crest. It is built of concrete with large stones imbedded in the concrete. The total volume, including the spillways, is 610,600 cubic yards. Another high masonry dam constructed by the United States Reclamation Service was the Elephant Butte Dam across the Rio Grande, 120 miles above El Paso, Texas. This dam, which was finished in 1916, has a height of 306 feet above bedrock, and contains 605,200 cubic feet of concrete.

brought to the dam site from borrow pits in cars was washed into position by hydraulic giants to a central pool divided by the core wall. Here a pump was installed to pump a large amount of the soft clay material from the lower side of the core wall to the upper side, leaving a fine graded sandy material against the down-stream side of the core wall and a clayey puddle against the up-stream side of the core wall.

The volume of the embankment is approximately 2,000,000 cubic yards. In the rock cliff on the west side a spillway was to be built with an overflow lip 420 feet long, equipped with six drum gates of the Arrowrock type, 65 feet long and 8 feet high. This spillway has a capacity under normal conditions of 30,-

Tieton Dam. In order to provide a reservoir with a capacity of 205,500 acre-feet as a part of the storage system for the Yakima project, Washington, the United States Reclamation Bureau constructed an earth dam on the Tulon River about 26 miles above Naches, Washington, in the Mt. Rainier National Forest. This was an earth dam heavily blanketed with rock, approximately 230 feet high and 900 feet long on the crest, with a concrete core wall of an approximate height of 330 feet extended over solid rock to the crest. During the construction of the dam a diversion tunnel 2200 feet long and of a diameter of approximately 21 feet was constructed to carry the waters of the Tieton River, and this work after the completion of the dam was to be used as a portion of the outlet control. The core wall consists of a concrete diaphragm completely across the core and tied into bedrock on the base and sides below the ground surface. It is five feet thick with no reinforcing. From the ground surface this core wall tapers to one foot thickness to the top of the dam, being heavily reinforced and without expansion joints.

The embankment forming the dam consists of hydraulic fill blanketed with rock, having a maximum height of approximately 230 feet, a crest 900 feet long with a 3 to 1 slope on the up-stream side, 25 foot top width and a 2 to 1 slope on the down-stream side. The material

000 second-feet and a capacity of 50,000 second-feet before the dam would be over-topped. It discharges through a concrete conduit down the slide of the cliff to a pool well below the toe of the dam. The outlet control works operate to control the water at three stages so that the gates will never have to operate under a greater head than 80 feet. These outlets each have a capacity of 25,000 second-feet which will be the maximum of any irrigation dam.

Boulder Dam. The United States Reclamation Service in 1924 proposed the improvement of the Colorado River Basin so as to provide adequate flood control, the impounding of water for irrigation, the storing of water for generating electric power, the provision of an all-American canal for supplying the Imperial Valley with irrigation water, and a possible future source of domestic water to supply California cities. An essential element of the project proposed was the construction of a dam across the Boulder Canyon, raising the water surface 605 feet, a height greater than that of the Washington Monument, and more than 2½ times as much as the Don Pedro Dam in California.

The proposed dam would contain over three and three-fourths million cubic yards of concrete, or more than three times as much as the Assuan Dam in Egypt, which with 1,179,000 cubic yards had a record for the greatest amount of masonry of any dam yet constructed, though

it was exceeded by the Wilson Dam with 1,291,385 cubic yards. The Boulder Dam would cost about \$50,000,000 or 2½ times as much as the Assuan Dam. It would provide a reservoir 120 miles long with an area of 157,000 acres, or 50 per cent greater than that of Gatun Lake on the Panama Canal. This reservoir would have a capacity of 34,000,000 acre-feet, eight times as great as that of Gatun Lake and nearly 13 times as great as that of the Elephant Butte Reservoir in New Mexico, the largest in the United States.

The dam as recommended in the Fall-Davis report, submitted in 1922, would begin 150 feet below the bed of the river, and would rise to a height of 605 feet, being 1350 feet long and 650 feet thick at its base. The construction would have been carried on in a normal current, 20 to 30 feet deep ordinarily, with a flood crest in the canyon of 30 feet, having a velocity of 15 feet per second at the time. This probably would require the diversion of the river through tunnels around the construction, which was in every way feasible. This report and supplementary opinion received the careful consideration of Congress, but up to the middle of 1924 no positive action had been taken in this connection.

Roller Crest Dam. The Grand River Dam, completed in 1915 to form a diverting structure of the high line or main canal project, was the largest of the roller crest dams built in the United States; in fact there were but two others, one a short single roller controlling a logway in the Boise Dam of the Reclamation Service, and the other an installation of three rollers in the Washington Water Power Company's dam at Long Lake, near Spokane. The Grand River Dam is a steel roller crest surmounting an ogee concrete weir, with a sluiceway and a canal intake of a capacity of 1425 cubic feet per second at its west end. By means of this roller crest the entire upper 10 feet of the dam can be raised above high water so that the elevation of the back water surface in flood is no greater than during operation for maximum requirements in low water. The axis of the dam is normal to the direction of the river, and on the west end is a canal intake controlled by nine regulator gates each 7 feet square. In front of the intake head wall is the sluiceway, 60 feet wide and 255 feet long. The dam proper consists of six bases, each 70 feet wide, or a total of 420 feet.

The roller crests consist each of a hollow steel cylinder, each 74 feet, 9¼ inches long, and 7 feet, 1¾ inches in diameter, the ends projecting about 2½ feet into recesses in the piers and rolled on smooth tracks at an angle of 20 degrees with the vertical, while a toothed rim engages in a toothed rack. The hollow cylinder axle and the required height of the crest is obtained by fastening to the cylinder an extension shield which rests on the sill when the roller is down, thus forming the bottom seal. There is also a roller crest at the sluiceway of essentially the same design but of different dimensions.

The Camarasa Dam. In 1921 there was completed in the Pyrenees Mountains in northern Spain the Camarasa Dam to form a reservoir for the Rio Noguera Pallaresa at a point 80 miles northeast of Barcelona. At the time of its erection this was the highest dam in Europe, and one of the highest dams in the world, ris-

ing to a height of 333 feet from bed rock to crest, and containing 285,000 cubic yards of cyclopean concrete. It is 270 feet wide at the base and 13 feet wide at the crest which is widened to 21 feet to provide a roadway and foot walk along the top, whose length is 460 feet. This dam is of gravity section and is arched on a radius of 1000 feet. It forms a reservoir which supplies a head of water so that at the power house below some 88,000 h.p. is generated. The dam was built in a very narrow part of a deep gorge, so that it was necessary to place the spillway adjacent to the south abutments of the dam, and the headworks controlled the flow to the power house on the opposite side of the north abutment. At the power house the total head of 270 feet was developed.

Montejaque Dam. In 1924 there was completed a concrete dam of pure arch type in the Andalusian Mountains of Spain, which with a maximum height of 273 feet from the lowest portion of the foundation to the crest was the highest structure of the kind essayed up to that time. It was built across a gorge of the Gaduarez River where the cliffs rise almost vertically, and was of variable radius increasing from 72 feet at the base to 123 feet at the crest which, measured along the centre line, was 256 feet in length. Excavation was begun in July, 1923, and the crushed stone and sand were obtained from adjacent sources of supply. The completed structure contained 35,000 cubic yards of concrete and formed a reservoir containing 1,412,000,000 cubic feet of water. The design was the work of Swiss engineers who also supervised the construction.

Tirso Dam. Completed in 1923 in western Sardinia, Italy, this multiple-arch dam 200 feet high, was the highest dam of this type in the world, being almost 70 feet higher than the Lake Hodges Dam which had the record for height in the United States. The Tirso Dam had reinforced-concrete arches supported on cut-stone masonry buttresses and formed the main structure of a power plant generating some 30,000 horse power at maximum load and 10,000 horse power normally. The dam itself forms a reservoir with a surface area of 8.5 square miles which has a storage capacity of some 330,000 acre-feet, and will furnish irrigation water to about 75,000 acres.

The Tirso Dam in southern Italy, built in 1923, was exceeded in height by a new dam built in the following year for the Suviana Reservoir on the Limentra di Treppio Brook in the Province of Bologna, which has a height of 286 feet as compared with 213 feet for the Tirso Dam. This was a concrete multiple-arch dam built for the State railways of Italy, so as to afford a storage capacity of 35,000 acre-feet, of which 29,000 acre-feet was to be utilizable storage.

In the development of water power in Italy a number of concrete multiple-arch dams of large proportions had been constructed, though they did not have the height of the two dams mentioned. Thus the Pavana Reservoir across the Limentra di Sambuca Brook, also in Bologna, was formed by a concrete multiple arch dam 187 feet high, and had a storage capacity of 810 acre-feet.

Indian Dams. Some of the largest and most notable dams and reservoirs in the world have been constructed in India to provide irrigation

and power. The more important are the following. The Periyar in the Madras Presidency, the Marekanave in the Mysore State, Lake Whiting at Bhatghar which supplies the Nira Canal in the Bombay Presidency, and the Tansa Reservoir, the principal source of water supply for Bombay, and Lake Fife near Poona. These dams were designed for a maximum height as follows: Periyar Dam 173 feet; the Marekanave Dam 167 feet, and the Tansa Dam 118 feet. Greater, however, than any of these was the Krishnaraja Sagara Dam which was built across the Kaveri River in the state of Mysore. This dam is built of rubble masonry with cut stone faces, and at its first stage has a height of 80 feet, but is designed to rise ultimately to a height of 120 feet. It affords a storage reservoir of 41,500 million cubic feet capacity, carrying nearly 30,000 acres. From this reservoir water would be provided for both irrigation and power in an unending supply as the water impounded in the monsoon season would be available for the use of farmers and make cultivatable an increased acreage of land. At the same time there would be developed increased power needed for the large hydroelectric station at Sivasumudrum, lower down the river.

The actual foundation of this dam, which was built on solid rock where considerable excavation was required, was 5150 feet in length, and the complete dam was to contain nearly 30,000,000 cubic feet of masonry.

Sukkur-Barrage, Bhatghar. Construction began on one of the largest dams in the world in October, 1923, across the Indus River in the Province of Sind in India at Bhatghar, 35 miles from Poona. This dam would form a reservoir with a storage capacity of 551,000 acre-feet as compared with 1,070,000 acre-feet stored by the Assuan Dam in Egypt, and would provide water for the irrigation of 6,000,000 acres of land, the entire project including about 850 miles of main canals, and over 1200 miles with branch canals in addition to the dam, costing about \$50,000,000. The dam known as the Lloyd Dam, or Sukkur-Barrage, will be one mile in length and will be built of masonry using local limestone, with 66 arched openings of 60 feet each, provided with control gates. The height of the dam above the lowest foundation will be 185 feet and the height of the water above the sills of the lowest sluices will be 143 feet, a height which can be increased to 153 feet by means of gates in the waste weir. The masonry content of the dam will be approximately 800,000 cubic yards, and it will have two bridges on the top, the lower one directly over the water openings, carrying a roadway, while the other will be used for the machinery operating the gates. The Lloyd Dam takes the place of an older dam.

In connection with the Lloyd Dam attention might be directed to the elaborate system of canals by which the water is distributed. The eastern canal at Nara is to be carried through a deep cut nearly double the width of the Suez, while the northeastern canal will be nearly 100 miles long, and will have about 500 branches, being nearly as wide as the Suez Canal, and will irrigate more than 750,000 acres. The Central Rice Canal, which is the second largest, will be 87 miles in length, and will have 350 miles of branches. It will have a discharge equal to that of the River Thames.

Hartebeestpoort Dam. In September, 1923, the Hartebeestpoort Dam on the Crocodile River in South Africa was completed. This dam, situated about 23 miles from Pretoria, closes a gap in the Magaliesberg Range, and affords a reservoir with a surface area of about 6.7 square miles with a gross storage capacity of 136,241 acre-feet at spillway level, or 123,232 acre-feet above outlet level, having a drainage area of 1506 square miles, and an average annual rainfall of 26.34 inches. The dam is built of concrete in arch plan, 195 feet high, from the lowest foundation to the top of the solid parapet wall. It has a top radius of 240 feet on the up-stream face, and at the bottom the radius is 148 feet and 75 feet on the up-stream and down-stream faces respectively, affording a thickness of 73 feet. From the bottom, elevation 3795, to elevation 3960, both faces have a batter of 1 in 5.714, above which point they are vertical giving a roadway along the top.

The height of the dam from the river-bed level to the elevation of the crest of the waste weir is 140 feet, with an approximate height flood level of 158 feet to the top of practically 163 feet. At the west side of the gap there was a flat slope which required the construction of a long tangent abutment beyond which the spillway was cut in the rock and separated from the reservoir proper by a levee or weir 420 feet long. This spillway was 56 feet wide at this upper end and increased in width to 125 feet at the bottom where it is crossed by a concrete arched bridge. The channel so formed is lined with concrete and beyond its lower end below the dam the rock surface of the cliff is faced with gunite. On each side of the dam there is an outlet tower from which through pipes the water is passed into an open canal, whence it proceeds for irrigation purposes to the territory below the dam. As the main road from Pretoria to Rustenberg crosses the dam it has been made particularly ornamental as regards its finish and that of the bridge towers.

Gleno Dam Failure. Among the more serious of recent dam failures was that of a multiple-arch dam at Gleno, about 30 miles northeast of Bergamo in north central Italy, on Dec. 1, 1923, resulting in a loss of some 500 lives and property destruction estimated at 150,000,000 lire. This dam, which formed a reservoir of 190,000,000 cubic feet capacity, was a reinforced concrete structure of multiple-arch type 143 feet in height above the stream, 863 feet long on top, and of curved ground plan, with a central portion 250 feet in length flanked on either end by straight portion tangents to the central curve. The multiple-arch construction rested on a gravity base of stone masonry, being substituted without proper authority for the gravity dam for which official permission had been granted. The masonry basin was 5½ feet high and some 250 feet long and carried the curved part of the superstructure, while the straight portions at the sides were built directly on the rock of the side of the valley. In all there were 25 arches of semi-cylindrical form, 26 feet 3 inches between buttresses and inclined 53 degrees to the horizontal.

At the time of the failure eight of the arches of the curved portion of the dam, together with their buttresses, and the first arch of the tangent section on the left bank together with the heavy buttress at the point of tangency went

out. This released a vast volume of water which passed down the steep and narrow valley of the Dezzo River, for 12 miles to its junction with the Oglio River at Darfo, and then down the Oglio Valley 5 or 6 miles to Iseo Lake at Pisogne. Power stations at Vilminore, Dezzo, Mazzuno, Angola and Darfo, a number of factories, including the Valtre Steel Works at Darfo, and many houses and villages were destroyed by the flood. The failure of the dam was due to the faulty design and construction of the base. The execution of the work was badly performed and there was a failure to cut footings in the rock for the buttresses. Improper materials, badly mixed and poured, lax inspection and incompetent direction, all contributed to the disaster as was revealed in an official report published in 1924. It was believed that one outcome of the catastrophe would be the formation of a government department to pass on the design and construction of all dams as had been proposed previously by different Italian engineers.

Bibliography. Among the recent and more notable works on dams available are—Wegmann, *Design and Construction of Dams* (7th ed., revised and enlarged, New York, 1922), which has a full bibliography of the available literature; Creager, *Engineering for Masonry Dams*, (New York, also translated into French); Morrison and Brodie, *High Masonry Dams* (2d ed., New York, 1916); Davis, *United States Irrigation Works* (Washington, D. C., 1917). Most satisfactory, however, are the files of the *Engineering News-Record* (New York); *Reclamation Record* (Washington); *Engineering* (London); and *Engineer* (London), and *Transactions of the American Society of Civil Engineers* (New York, current), as well as *Reports Chief of Engineers U. S. Army* (Washington, annual); and *Reports Commissioner of the Reclamation Bureau* (Washington, annual).

DANA, PAUL (1852-). An American editor (see VOL. VI). He was stationed at Namur from May to June, 1915, as a member of the Committee for Relief in Belgium.

DANDURAND, ROUL (1861-). A Canadian lawyer and statesman (see VOL. VI). In 1921, he became minister without portfolio in Canada. Mrs. Dandurand, his wife, was elected vice-president of the National Council of Women, and was decorated by the French government.

DANE, CLEMENCE (WINIFRED ASHTON) (?-). An English author, who wrote the following novels: *Regiment of Women*; *First the Blade*; *Legend*, a novel composed chiefly of conversation which gives a striking revelation of character, through its subtlety of method. She also wrote the following dramas: *A Bill of Divorcement*, played in New York in 1921; *Will Shakespeare*, played during the 1922-23 season, and *The Way Things Happen*.

DANIELS, JOSEPHUS (1862-). An American public official (see VOL. VI). He was Secretary of the Navy under President Wilson from 1913 to 1921, and from the beginning urged the establishment of a larger navy. That he had the real interests of the enlisted men of the navy at heart is shown by his order that no intoxicants should be allowed on shipboard, and by the fact that he caused opportunities to be given for the training of the men in various trades. He believed in government ownership of armorplate factories, and of tele-

phones and telegraphs. In 1921, he resumed the editorship of the *Raleigh News and Observer*. He wrote: *The Navy and the Nation* (1919).

DANUBE RIVER. See WAR IN EUROPE, *Balkan Front*.

DANZIG. Formerly belonging to Germany, but since 1920 a Free City established by the Treaty of Versailles and placed under the League of Nations' protection. The area of the district is about 745 miles, and the population, on Jan. 1, 1923, 365,000, largely German; in fact, only 6 per cent were Poles. The Free City area contains 325 localities, four of them cities with the following populations: Danzig proper, 194,953; Zoppot, 18,397; Neuteich, 2395; Tiegenhof, 2334. Of the Free City's total boundary line of 147 miles, 35 miles are on the sea. The production of the rural sections fell short of the requirements of the population with the result that foodstuffs had to be imported. The same was true of lumber, and stocks had to be imported from Poland. With Poland, Danzig was connected by three main lines, Danzig to Warsaw, 204 miles; Danzig to Lodz, 263 miles; Danzig to Posen, 192 miles. Inland waterways communication was of course maintained by the Vistula. Although by 1922 Danzig's trade had not reached pre-war proportions, it seemed in a fair way to recover its old stability. In 1913, 1921, and 1922, imports into Danzig by sea weighed, in metric tons, 1,233,630, 1,322,428, and 466,286; and exports by sea, 878,471, 383,448, and 504,876. A resumption of the importation of hides and skins, wool, wine, etc., all of which were destined for reshipment, appeared in 1922. Before the War, the principal exports from Danzig were grain, lumber, and sugar. Lumber, by 1922, had recovered pre-war proportions; sugar, too, was rapidly increasing, but grain had become an article of import. In 1913, 2854 vessels of 918,097 net tons entered and 2836 vessels of 931,509 net tons cleared Danzig; in 1922, 2712 vessels of 1,423,132 net tons entered and 2697 vessels of 1,428,820 net tons cleared. In 1923, 1,722,927 tons entered and 1,689,255 tons cleared. The disproportion between imports and exports for 1919-22 was largely due to the size of relief shipments originating in the United States. In 1920, 88 per cent of the total trade was made up of imports; in 1921, 78 per cent; but in 1922, 48 per cent, which approximated the pre-war status.

History. The problem posed in 1919 by the Polish claim to a sea outlet involved several important considerations. Danzig, the focal point of Polish aspirations, was overwhelmingly German in population, at least 90 per cent. The creation of a Polish "corridor" through Prussia to connect Poland with Danzig on the sea meant the separation from the Reich of some 2,000,000 Germans in East Prussia. On the other hand, Danzig was bound up with the life of the new state economically and geographically, for Danzig was the port of the Vistula, and the valley of the Vistula was really Poland; of the 40 cities of more than 20,000 population in Poland, 23 are in the valley of the Vistula system. If on the grounds of history, race, and economic necessity the Germans could ob-

ject to an outright cession of Danzig, the Poles could answer that Danzig had remained loyal to Poland as late as 1813, that under Prussian rule the city had dropped, as a commercial port, to a place of comparative insignificance, and that the well-being of 20,000,000 Poles was perhaps more important than the interests of the 170,000 inhabitants of the city or at most, 360,000 Germans in the city and the adjacent area. But to preserve the principle of self-determination of which so much had been made during the War, and to check the growth of a German irredentism, a compromise had to be effected. Articles 100-108 of the Treaty of Versailles, therefore, set up in Danzig and the German area about it a Free City under the League of Nations. Its governing head was to be a High Commissioner; foreign relations and customs tariff were to be controlled by Poland, while economic matters such as administration of railways, posts, telegraph lines, waterways, and port facilities, were to be largely in Polish hands. Under Article 103 of the Versailles Treaty, which provided for the drafting of a constitution by representatives of the city in agreement with the High Commissioner appointed by the League, a Constituent Assembly was elected in Danzig on May 16, 1920, by universal suffrage with proportional representation. This Assembly, in which the various German parties had an overwhelming majority, drew up a constitution which was approved by the High Commissioner and the League. The City's relations with Poland were defined by a treaty signed on Oct. 27, 1920, and ratified on November 9, and by a supplementary treaty of Oct. 24, 1921, regarding economic matters and naturalization. The formal proclamation of the new state, in accordance with these arrangements, occurred on Nov. 15, 1920. The essential points of the new system thus created were that the High Commissioner was to decide all points of dispute between Danzig and Poland, though a right of appeal to the League Council was assured; local autonomy was preserved through the creation of a bicameral diet, the president of whose upper house was to act as state head; a single customs area was to exist, and Poland was to be in charge of railway, postal, telegraph, telephone, diplomatic, and consular matters; Danzig port and terminal questions were to be in the hands of a joint board headed by a neutral. Any settlement so thoroughly permeated by the spirit of compromise was certain to be stigmatized as unfair by both sides, yet the Danzig experiment was more successful than some of the other decisions of the Peace Conference, albeit, as events of 1920-24 manifested, the causes of irritation were many. Sir Reginald Tower and the other Englishmen who succeeded him in the office of High Commissioner displayed admirable tact and impartiality in their difficult task; nevertheless in the first 18 months of the Free City's existence, appeals were made to the League Council against nine of his 12 decisions. The announcement of the League Council that the former German rifle factory at Danzig must be closed by July 30, 1921, was provocative of considerable resentment in Danzig. On the other hand, the refusal of the Danzig government, backed by High Commissioner Tower, to permit the passage of supplies to Poland during the Russo-Polish War, was censured by both Poland and France. Polish intentions to establish an

ammunition dépôt in the centre of Danzig harbor infuriated the Danzigers, while the steady infiltration of Polish business men, officials, and publicists threatened to contest the German supremacy. Nevertheless a more amicable attitude on the part of the Danzigers appeared as they began to realize that their economic interest would be best served by a prosperous Poland. Polish penetration of the region was tending to turn the city into a Polish port. See *POLAND, History*.

DARDANELLES AND BOSPORUS STRAITS. Economically and strategically the excellent position of Constantinople at the crossroads of Europe and the Near East caused many of the Great Powers to regard this whole region with an acquisitive eye. To Russia its possession implied a "warm water" port fronting on the seas of the world, and long before the dawn of the 20th century Russian expansionists looked on the Golden Horn as their ultimate goal. When in 1913 Germany arranged to send a military mission to Turkey, with the aim of strengthening the Turco-Teutonic grip on the Straits, Russian resentment took the form of a secret crown council, which discussed plans for the seizure of the vital waterway in case of war. After the War began, in 1914, Russia held an expeditionary force ready for months to sail for the Bosphorus, but it was never sent. The Czar's government succeeded in vetoing a projected Greek attack on the Straits in 1915, and in exacting from France and England, in March of the same year, a pledge that the entire region of the Straits must be allotted to Russia in case of the Allies' victory. To Germany, on the other hand, the unhampered control of the waterway by a friendly Turkey meant the realization of the Berlin to Bagdad scheme and the checking of Russian aspirations. German domination of the Straits was destroyed by the Allies' military success in the War, while Russia's claims were cast aside after the Bolshevik revolution. At the close of the War there remained to be considered the claims of the Turks, reinforced by Moslem sentiment everywhere, most particularly in India; of the Greeks, whose pretensions far exceeded their power; of the Black Sea peoples of Bulgaria, Rumania, the Ukraine, and Transcaucasia, whose maritime intercourse with the West depended on freedom of the Straits; and, above all, of the British, whose historic policy of barring the Straits against Russia had been suddenly exchanged for the exact opposite, "freedom of the Straits." These warring purposes were reflected in the compromise which was struck in the Treaty of Sèvres of 1920. Constantinople, with the region surrounding the Sea of Marmora, was restored to Turkey. The Straits themselves were placed under the control of an international commission while the whole region about was demilitarized and all fortifications were ordered destroyed. The sudden appearance and astounding success of the Turkish Nationalists indicated the ephemeral nature of the settlement, for one of the watchwords of the new leaders was the reestablishment of the security of the Straits and the Sea of Marmora. During 1921-23 the matter caused much anxiety to both the British and the French. Military men, Marshal Foch among them, pressed for an Allied or international domination of the gateway, for the disastrous Gallipoli campaign had indicated how

successfully a force on the banks could block the passage of ships. Something of these purposes was written into the first draft treaty at Lausanne, but that document's rejection by the Turkish National Assembly in February, 1923, left the matter still unsolved. Finally, to the completed Treaty of Lausanne of July, 1923, was appended an elaborate convention for the regulation of the Straits in peace and war. Once more a commission was set up under the protection of the League of Nations, this time presided over by a Turk with powers to execute the prescribed regulations for the passage of ships. A demilitarized zone was again mapped out, to include much smaller areas along the shores of the Dardanelles Strait and the Strait of Bosphorus. The Turks were permitted to maintain a garrison at Constantinople, and the free movement of their fleet in Turkish waters was not to be impaired. In time of peace the Straits were to be free for all merchant vessels and for warships; in time of war, Turkey, if a belligerent, was permitted to exclude enemy merchantmen and warships.

DARLING, SAMUEL TAYLOR (1872-). An American physician, parasitologist and authority on tropical medicine, born in Harrison, N. J. He obtained his medical degree at the College of Physicians and Surgeons at Baltimore in 1903 and he was in charge of the laboratory at the Panama Canal during the construction period (1906-14), later accompanying General Gorgas to South Africa. He became a member of the staff of the Rockefeller Foundation in 1915 and was chairman of the expedition to the Far East for the purpose of studying hookworm and malaria; later, he visited Brazil in a similar capacity. He has written many papers on tropical diseases and animal parasites and has published, in collaboration: *Hookworm and Malaria Research in Malaya, Java and the Fiji Islands* (Darling, Barber and Hacker, 1917), and *Studies in Hookworm Infection in Brazil* (Darling and Smillie, 1921).

DARLINGTON, JAMES HENRY (1856-). An American bishop (see VOL. VI). He declined an appointment to the United States Commission to Russia, but became head of the Serbian Relief Fund in the United States. In 1920, he was chairman of the commission to confer with the Eastern Orthodox Churches and the Old Catholics from the Episcopal Church of the United States, which visited Constantinople, Athens and other European capitals for the purpose of making a concordat.

DARLINGTON, URBAN VALENTINE W. (1870-). An American bishop, born in Shelby Co., Ky., and educated at the Kentucky Wesleyan College. In 1896, he was ordained to the ministry of the Methodist Episcopal Church, South, and from that time until 1917 was pastor in various churches in Kentucky and West Virginia. In 1917-18, he was president of the Morris Harvey College in Barboursville, W. Va. In 1918, he was made a bishop of the Methodist Episcopal Church, South.

DARMSTAEDTER, PAUL (1875-). A German historian, born in Berlin. He studied at the universities of Berlin, Munich, Freiburg and Strassburg, and became professor in Göttingen in 1907. His works include *Das Reichsgut in der Lombardei und in Piemont* (1896), *Die Befreiung der Leib eigenen in Savoyen, Schuiez und Lothringen* (1897), and a history

of the United States for Ullstein's *History of the World*. A recent publication was *Geschichte der Aufteilung und Kolonisation Afrikas* (1913-20).

D'ARSONVAL, ARSÈNE. See ARSONVAL, ARSÈNE D'.

DARTMOUTH COLLEGE. A nonsectarian institution at Hanover, N. H., for which an English royal charter was granted in 1769. With the exception of the war years 1917-19, when the number of students registered in the college fell off sharply, Dartmouth grew steadily during the decade from 1913 to 1923-24. During that time the enrollment increased from 1329 to 2065, and two new dormitories, Topliff Hall and Russell Sage Hall, the Steele Chemistry Building, Robinson Hall, headquarters of other than athletic student organizations, the new golf links at Hilton Field, the Spalding Swimming Pool, and the concrete football stand, a memorial to the Dartmouth men who died in the War, were built. From 1916 to 1923-24 the faculty was increased from 123 to 177 and the library from 130,000 to 175,000 volumes. In 1922 a new selective process for admission was adopted. Ernest Martin Hopkins, Litt D, LL.D., succeeded Ernest Fox Nichols as president in 1916.

DARWINIAN THEORY. See HEREDITY; ZOOLOGY.

DASKAM, JOSEPHINE DODGE (MRS. SELDEN BACON) (1876-). An American author (see VOL. VI). Her recent works include: *Today's Daughter* (1914); *Open Market* (1915); *When Binks Came*; *The Memoirs of a Baby* (1920); *Blind Cupid* (1923), and new editions of many of her earlier publications. She is also the compiler of *On Our Hill* (1918), and *Square Peggy* (1919).

DATO ESTRADIER, EDUARDO (1856-1921). A Spanish jurisconsult and statesman (see VOL. VI). Upon the outbreak of the War, Dato was still in office and Spain's neutrality was a result of his efforts. He was prime minister during the crisis of 1917, and again in 1920-21. He was murdered at Madrid on Mar. 8, 1921.

DAUDET, ERNEST (1837-1921). A French novelist and historian (see VOL. VI). Following are his principal works published since (1914), *Devant la douleur* (1915), *L'entre-deux-gens—Joseph* (1917); *La Mission du Duc de Saint-Vallier* (1918); *La Mission du Baron de Courcel* (1919); *Soixante années du règne des Romanoff* (1919); *Souvenirs de mon temps* (1st vol., 1921; others to be finished by his son). He died at Petites-Dalles (Seine-Inférieure) on Aug. 20, 1921.

DAUDET, LÉON (1867-). A French novelist and editor, member of the Académie Goncourt (see VOL. VI). Since 1913, he has published *Souvenirs des milieux littéraires, politiques, artistiques et médicaux de 1880 à 1905*, in four series, as follows: *Fantomes et vivants* (1914), *Devant la douleur* (1915), *L'entre-deux-guerres* (1915), *Salons et journaux* (1917). His other works during the decade include: *Hors du jong allemand* (1915); *La vermine du monde* (1916); *Le Bonheur d'être riche* (1917); *Le cœur et l'absence* (1917); *L'hérédité* (1917); *Le poignard dans le dos; notes sur l'affaire Valvy* (1918); *Dans la lumière* (1919); *Suzanne* (1921); and *Le stupide XIXe siècle* (1921); *Les Oeuvres devant les Hommes* (1922); *Sylla et son destin* (1923); *L'Héca-*

tombe (1923). During the War he was prominent in the campaign against defeatism and afterwards was especially conspicuous as head of the Action Française in monarchist agitation.

DAUGHERTY, HARRY MICAJAH (1860-). An American public official, born at Washington Court House, Ohio. He was educated in the public schools and studied law at the University of Michigan. He began practice at Washington Court House in 1881 and in 1893 removed to Columbus, Ohio, where he was in practice from 1902 to 1921. He was active in politics and was one of the leaders responsible for the nomination and election of President Harding, in whose cabinet he became Attorney General in 1921. Prior to that time he had served in the Ohio House of Representatives for two terms. Following the death of President Harding in August, 1923, Mr. Daugherty was retained in office by President Coolidge. Throughout his term of service he had been subject to severe criticism and this culminated in 1922 in an effort to bring impeachment proceedings in the House of Representatives. This failed on the ground that the evidence did not warrant the proceedings. In March, 1923, as a result of charges instigated chiefly by Senator Wheeler of Montana, a committee of the Senate began an investigation into Mr. Daugherty's administration of his office. In spite of great pressure brought to bear upon him, President Coolidge refused to ask for Mr. Daugherty's resignation until the charges had been heard. Following Mr. Daugherty's refusal to furnish certain information to the committee, President Coolidge asked for and received his resignation on Mar. 28, 1924.

DAVENPORT, EUGENE (1856-). An American agriculturist (see Vol. VI). From 1895 to 1922, he was dean of the College of Agriculture at the University of Illinois, and in the latter year was made professor emeritus. Until 1922, he was director of the Agricultural Experiment Station and professor of thrematology at the University of Illinois. He wrote many agricultural bulletins for the experiment stations of Michigan and Illinois.

DAVENPORT, GEORGE WILLIAM (1870-). An American Protestant Episcopal bishop, born at Brandon, Vt. He studied at Hobart College and was graduated from the General Theological Seminary in 1896, in which year he was also ordained to the priesthood. Subsequently he was rector of various churches in the East, until he was consecrated bishop on Sept. 15, 1920, when he went to live at Easton, Md. While in Burlington, he served as provincial secretary of the first province.

DAVIDSON, JO (1883-). An American sculptor born in New York City of Russian parents. He has won fame for his sculptures by the interpretation of the mental and physical in his subjects. His art is expressive of subdued emotion and characterized by massiveness of line. He is essentially sophisticated with a sophistication which does away with poses, attitudes and conventional mannerisms in his portraits. He struck out a line for himself and won recognition in Paris, America and London. Besides his many portraits, Mr. Davidson designed the United States War Industries Badge. He also designed a heroic group for the French government to commemorate the first victory of the Marne.

DAVIDSON COLLEGE. An institution at

Davidson, N. C., founded in 1837. During the years 1914-24 the student body increased from 335 to 575, the teaching staff from 15 to 31, and the productive endowment from \$284,745 to \$630,000. Because of a fire which destroyed 10,000 books, the number of volumes in the library decreased from 23,276 to 21,000. Income increased from \$48,557 to \$206,000. Three large fireproof dormitories housing 340 students were erected at a cost of \$225,000, and a central heating plant, a laundry, and homes for professors were built. Twenty-nine courses were added to the curriculum, and the entrance requirements were raised. President, William J. Martin.

DAVIES, ARTHUR B. (1862-). An American painter (see Vol. VI). In 1916, he was awarded the first W. A. Clark prize and Corcoran gold medal. His manner continued highly individualistic, his rebellion against the existing order still softened by the romantic, mystic atmosphere with which he surrounded his subjects. In his later works, among them "Sea, Wind and Sky," "Strewing Dust," and "Orchard of Pleasant Bounties," something of the mathematical or intellectual appeared to be displacing his earlier instinctive rhythm. By some, his feeling for abstract beauty was felt to be verging on preciosity.

DAVIES, SIR LOUIS HENRY (1845-1924). A Canadian jurist (see Vol. VI). From 1882, he was elected successively in the Dominion House of Commons, and continued a member until his appointment as chief justice of the Supreme Court of Canada in 1918. In the same year, Chief Justice Davies became Deputy Governor-General of Canada.

DAVIES, SIR (HENRY) WALFORD (1860-). A British organist and composer, born at Oswestry, England. He received his first musical education as a chorister in St. George's chapel, Windsor. From 1885 to 1890, he studied organ with Sir W. Parratt, acting frequently as his assistant. In 1890, he won a scholarship at the Royal College of Music, where for four years he studied composition, at the same time holding positions as organist. In 1895, he succeeded Rostro as professor of counterpoint at the Royal College of Music, remaining there till 1919, when he became professor of music at the University of Aberystwyth. He also was conductor of the London Church Choir Association (1901-13) and of the Bach Choir (1903-07). He was knighted in 1922. His works include an oratorio, *The Temple*; three symphonies; two overtures, *Dedication* and *Festal*; two suites for orchestra, *Parthenia* and *Wordsworth*; a *Short Requiem* a cappella; three piano quartets, two string quartets; three violin sonatas, a horn sonata; anthems, songs and part-songs. He also published *Music and Christian Worship* (1913).

DAVIES, WILLIAM HENRY (1870-). A Welsh poet and author, born at Newport. He began life as a picture-frame maker, but after completing his apprenticeship, he tramped through England and America, picking fruit, selling pins and needles, etc., and crossed the ocean several times on cattle boats. His poems include *The Soul's Destroyer* (1907), *Forty New Poems* (1918), *The Hour of Magic and Other Poems* (1922); and his prose works are *The Autobiography of a Super-Tramp* (1908), *Beggars, a Weak Woman, The True Traveler, Nature, and A Poet's Pilgrimage*.

DAVIS, CHARLES HAROLD (1856-). An American painter (see VOL. VI). The change from his earlier tendency to interpret nature in her more sombre moods is to be seen in such later paintings as "The Sunny Hillside," "In Golden Light," and "On the West Wind," where hill and tree, as well as cloud, are used expressively, and a spirit of light and joy predominates.

DAVIS, HARVEY NATHANIEL (1881-). An American physicist, born at Providence, R. I. He was graduated in 1901 at Brown University and received his Ph.D. at Harvard in 1906. He was instructor of physics at Harvard 1905-10, and in 1919, after successive promotions, he became professor of mechanical engineering. He also served with the General Electric Company during 1917-18, in charge of their turbine department; and in 1921 became consulting engineer to the United States Bureau of Mines. During the War, he was associated with the Air Service of the United States Army as a mechanical engineer. His various original investigations have had to do with the thermal properties of matter. He is the author (with L. S. Marks) of *Steam Tables and Diagrams* (1908), and (with N. H. Black) of *Practical Physics for High Schools* (1913).

DAVIS, HENRY WILLIAM CARLESS (1874-). An English historian (see VOL. VI). In 1915, he was a member of the War Trade Intelligence Department, and the following year of the War Trade Advisory Committee. He was made Commander in the Order of the British Empire in 1918. He became director of the *Dictionary of National Biography* (1920), and professor of modern history in the University of Manchester (1921). His works include: *Political Thought of Treitschke* (1914); *Why We Are at War* (in collaboration, 1914); contributions to the *History of the Peace Conference* (ed. Temperley, 1920, etc.) and to *The Encyclopædia Britannica* (12th ed., 1922). He edited *Oxford Pamphlets* (1914-15).

DAVIS, JAMES COX (1867-). An American lawyer, born at Keokuk, Iowa. After passing through the public schools of Keokuk and London, Ont., he was admitted to the bar in 1877 and began practice in Keokuk, where he remained until 1903. He acted as city solicitor of Keokuk, and as mayor. Under the Federal administration of railways, he was general solicitor for the Chicago and Northwestern, and in 1920-21 he was general counsel of the United States Railroad Administration. In the latter year, he was appointed Director-General and Agent of the President in settling controversies arising out of Federal control.

DAVIS, JAMES JOHN (1873-). An American cabinet member, born at Tredegar, South Wales, where he was educated at the public schools. He came to the United States in 1881 and worked in iron mills in Pittsburgh and in Elwood, Ind. From 1898 on, he was active in city and State politics in Indiana and in various fraternal organizations. He was named Secretary of Labor in 1921.

DAVIS, JOHN WILLIAM (1873-). An American lawyer and diplomatist, born at Clarksburg, W. Va., and educated at Washington and Lee University. He was admitted to the bar in 1895, and from 1896 to 1897 was assistant professor of law in Washington and Lee University. During the period 1897-1913, he practiced law at Clarksburg, took an active in-

terest in State and national politics, and was elected to Congress. From 1913 to 1918, he was solicitor-general of the United States, and from the latter year until 1921 he was ambassador to Great Britain. In 1924, he was Democratic nominee for the Presidency. See *UNITED STATES, History*.

DAVIS, KATHERINE BEMENT (1860-). An American sociologist (see VOL. VI). She was appointed, by Mayor Mitchel, Commissioner of Correction of New York City, for the term Jan. 1, 1914, to Dec. 28, 1915. From 1915 to 1917, she was chairman of the Parole Commission. In 1918, she was director of the women's work section of the Social Hygiene Division of the Commission on Training Camp Activities, and in the same year, was appointed general secretary of the Bureau of Social Hygiene.

DAVIS, NORMAN H. (1878-). An American statesman, born in Bedford Co., Tenn., and educated at Vanderbilt University and the University of California. In 1902, he interested himself in the sugar, banking, and other businesses in Cuba. During the War, he was active on various commissions and boards and as special delegate to foreign countries, particularly as regards financial problems. He was financial adviser to the American Peace Delegates in Paris and was a member of the Armistice Commission and of the Supreme Economic Council. In 1919-20, he was Assistant Secretary of the Treasury, and from 1920 to 1921, he was alternately Under Secretary of State and Acting Secretary of State.

DAVIS, OWEN (1874-). An American dramatist born in Portland, Me., who began writing plays in 1898 and has written more than 100 plays produced in New York. Of these about 50 were produced by A. H. Woods and were mostly melodramas. His most recent popular plays were: *The Family Cupboard*; *Sinners*; *Male a Minute*; *Forever After*; *Opportunity*; *The Detour* (1921); *Icebound* (1922), which was awarded the Pulitzer Prize for the year.

DAVISON, HENRY POMEROY (1867-1922). An American banker born at Troy, Pa., June 13, 1867. After a school education at Greylock Institute, South Williamstown, Mass., he was errand boy in a bank conducted by his uncle at Troy, Pa. He later went to the Astor Place Bank, New York City, remaining there from 1891 to 1894. He became vice-president of the First National Bank in 1902 and afterwards a member of the firm of J. P. Morgan and Company. He was chairman of the executive commission and a director of the Bankers' Trust Company; director of the American Foreign Securities Company; and from 1917 to 1919, he was chairman of the War Council of the American Red Cross, during the time when \$300,000,000 was raised by popular subscription for war sufferers, and he was elected chairman of the governing board of the World League of Red Cross Societies in Paris, May, 1919. He died May 6, 1922.

DAWES, CHARLES GATES (1865-). An American public official (see VOL. VI). In 1917, he was in France on General Pershing's administrative staff. He was chairman of the general purchasing board, and also general purchasing agent for the United States Army in France. In 1919, he returned to the United States, and in 1921 was appointed by the President as director of the newly created Bureau

of the Budget, and organized the first budget of the United States government. On July 8, 1922, he retired from the Budget Bureau, and in November of the same year was elected director of the Chicago and Great Western Railway Company. At the beginning of 1924, General Dawes was appointed chairman of a group of experts to ascertain Germany's capacity to pay reparations for the losses caused by the War. This Reparations Commission arrived in Berlin on Jan. 30, 1924, and submitted a report on Apr. 9, 1924. The report was favorably received in practically all the Allied and neutral countries, and even Germany was not wholly hostile to its provisions. On June 12, 1924, General Dawes was nominated for vice-president of the United States by the Republican party in convention at Cleveland, Ohio.

DAWES REPORT. See REPARATIONS.

DAWSON, ALEC JOHN (1872-). An English novelist (see VOL. VI). He served throughout the War (1914-19), and was awarded the Croix de Guerre with Palm, and was made a member of the Order of the British Empire. He entered the service in 1914 as temporary lieutenant, was advanced to the rank of captain the following year, and thereafter was attached to other branches of the service, including the Military Intelligence Staff of the War Office, and the Air Intelligence Staff. In 1918, he joined the Royal Air Force, becoming major the same year. In 1919-21, he was director of information to the Government of Bombay. He is author of: *How to Help Lord Kitchener* (1914); *Somme Battle Stories* (1916); *Back to Blighty* (1917); *For France* (1917), and *Everybody's Dog Book* (1922).

DAWSON, CONINGSBY (WILLIAM) (1883-). An Anglo-American author (see VOL. VI). He joined the Canadian Army at the front in 1916, and continued in service until the end of the War. After having been wounded, he came twice to the United States (1917, 1918) on lecture tours. In 1918, he investigated, for the British Ministry of Information, American military preparedness in France. In 1919, he went to England to study European reconstruction problems, and subsequently lectured on the subject of the United States. He also visited and reported on the devastated regions of Central and Eastern Europe at the request of Herbert Hoover. His recent works include: *Florence on a Certain Night* (1914); *The Raft* (1914); *Slaves of Freedom* (1916); *The Seventh Christmas* (1917, 1921); *Carry On* (1917); *The Glory of the Trenches* (1918); *Out To Win* (1918); *Living Bayonets* (1919); *The Test of Scarlet* (1919); *The Little House* (1920); *It Might Have Happened to You* (1921); *The Kingdom Round the Corner* (1921, 1923), and *Christmas Outside Eden* (1922). He also edited, with W. J. Dawson (q.v.), *Best Short Stories* (1923).

DAWSON, MILES MENANDER (1863-). An American lawyer (see VOL. VI). He was adviser to the Governor of New York and the commission regarding workmen's compensation in 1914. He was special counsel for the United States in the tax litigation in 1915 and 1917. In 1917 and 1921 he was adviser to the War Risk Bureau, and in 1918-19, special attorney examiner for the United States Shipping Board Emergency Fleet Corporation. In the latter year, he was also counsel and actuary for the commission to investigate the New York State

Insurance Fund. He is the author of *The Ethics of Confucius* (1915), and the translator of *Brand*, a poetical tragedy, by Henrik Ibsen (1916).

DAWSON, WILLIAM JAMES (1854-). An English clergyman and author (see VOL. VI). He is the author of: *Robert Shenstone* (novel, 1917); *The Father of a Soldier* (1917); *The War Eagle* (1918); *Chalmers Comes Back* (1919), and *The Borrowdale Tragedy* (1920). He edited, with Coningsby Dawson (q.v.), *Best Short Stories* (1923).

DAY, CLIVE (1871-). An American university professor (see VOL. VI). He was chief of the Balkan Division of the American Commission to Negotiate Peace (Paris, 1918-19). He published a revised and enlarged edition of his *History of Commerce* (1922) and *The Question of the Balkans*, a brochure, (1920).

DAY, HOLMAN FRANCIS (1865-). An American author (see VOL. VI). Among his later works are: *The Landloper* (1915); *Along Came Ruth* (play produced in New York, 1914); *Blow the Man Down* (1916); *Where Your Treasure Is* (1917); *Kavanagh's Clare* (1917); *The Rider of the King Log* (1919); *When Egypt Went Broke* (1920); *All Wool Morrison* (1921).

DAY, JAMES ROSCOE (1845-1923). An American educator (see VOL. VI). In 1922, he became chancellor emeritus of Syracuse University. He was famous as a defender of "big business." During and after the War he criticized the Wilson administration and the League of Nations unsparingly. He published *My Neighbor the Workingman*, and at the time of his death was about to start on an autobiography. He died at Atlantic City on Jan. 13, 1923.

DAYTON. A city of Ohio. The population rose from 116,577 in 1910 to 152,559 in 1920, and to 165,530, by estimate of the Bureau of the Census, for 1923. A flood prevention works, which was considered one of the world's greatest engineering projects, was begun immediately after the flood of 1913 and completed in 1923, at a cost of \$35,000,000. Five aviation fields were established at and near Dayton, which came to the fore as a centre of aviation. The United States government aviation experiment laboratories were located at McCook Field, and a supply depot and airplane manufacturing plant at Wilbur Wright Field, which was expanded to 5000 acres by a gift of the people of Dayton to the government. Early in 1924 a city planning and zoning commission was appointed.

DEALEY, JAMES QUAYLE (1861-). An American university professor (see VOL. VI). He was president of the American Sociological Association in 1920, and in 1921 went to China as exchange professor and lecturer. He is author of *The Growth of State Constitutions* (1915); *Sociology—Its Development and Applications* (1920); and *State and Government* (1921).

DEAN, ARTHUR LYMAN (1878-). An American chemist, born at Southwick, Mass. He was graduated at Harvard in 1900 and received his Ph.D. from Yale in 1902. During 1902-07, he taught plant physiology at Sheffield Scientific School, Yale, and was also a Carnegie research assistant during 1904-05 as well as chief of the section of wood chemistry

in the United States Forest Service during 1905-07. He had charge of the chemical laboratory of A. D. Little in Boston during 1907-08, but at the close of the year returned to the Sheffield Scientific School, being assistant professor until 1914 when he was called to the presidency of the University of Hawaii in Honolulu. His original investigations have included studies on inulin, proteolytic enzymes, creosote oils, and chaulmoogra oil in treatment of leprosy, on all of which he has published valuable papers.

DEARBORN, GEORGE VAN NESS (1869-). An American psychologist and surgeon, born at Nashua, N. H. He was educated at Dartmouth College and received his medical degree from the College of Physicians and Surgeons, Columbia University, in 1893. He then devoted himself to graduate study in psychology at Harvard and Columbia Universities, and following his doctorate he became a professor of psychology and education. The greater part of his career was spent at the Sargent Normal School, Cambridge, Mass. Besides various contributions to professional journals, he is the author of a number of books on psychology and hygiene, the more important of which are the following: *The Emotion of Joy* (1899), *Textbook of Human Physiology* (1908); *Motor-Sensory Development* (1910), and *Physiology and Hygiene* (1921).

DEARBORN, WALTER FENNO (1878-). An American psychologist and educator born at Marblehead, Mass. He was educated at Wesleyan and Columbia Universities, receiving his degree of Ph.D. from the latter institution in 1905. He pursued medical studies in German at the University of Munich. He taught educational psychology at the University of Wisconsin, and in 1909 was called to the faculty of Harvard University. One of the leading authorities in educational psychology, Professor Dearborn has contributed numerous papers on the psychology of reading, the practice experiment in learning, intelligence tests, mental hygiene, and school training.

DEATH. See ZOOLOGY.

DEAVER, JOHN BLAIR (1855-). An American surgeon, who received his medical degree from the University of Pennsylvania in 1878, and after holding several other teaching and hospital positions was appointed Barton professor of surgery in his alma mater and chief surgeon to the University Hospital. His major publications include: *Treatise on Appendicitis* (1896), which was expanded in its fourth edition (1913); *Surgical Anatomy*, 3 vols. (1889-93); *Enlargement of the Prostate* (1905); *Surgery of the Upper Abdomen*, in collaboration with Ashhurst, 2 vols. (1909, 1913); *Surgical Anatomy of the Head and Neck* (1912); *The Breast*, in collaboration with McFarland (1917); *Excursions into Surgical Subjects*, with Reimann (1923).

DE BLOIS, AUSTEN KENNEDY (1866-). A Canadian clergyman, born at Wolfville, N. S., educated at Brown University, and at Berlin and Leipzig, Germany. He became president of Shurtleff College, Alton, Ill., in 1894. During 1900-01, he traveled in Europe and Africa, and on returning to the United States became pastor of several Baptist churches successively. He wrote: *Bible Study in American Colleges* (1899); *The Pioneer School* (1900); *Imperialism and Democracy* (1901); *History of the*

First Baptist Church in Boston, 1665-1915 (1916); *Life of John Mason Peck, Prophet of the Prairies* (1917); *The Message of Wisdom: Studies in the Book of Proverbs* (1920).

DEBS, EUGENE VICTOR (1855-1923). An American labor organizer (see VOL. VI). He was convicted of violation of the espionage act in September, 1918, and was sentenced to 10 years' imprisonment in the penitentiary. The decision was sustained by the Supreme Court of the United States on Mar. 10, 1919, and he went to prison on Apr. 13, 1919. He was pardoned by President Harding on Dec. 24, 1921, but his political rights were not restored.

DEBT, PUBLIC. See FINANCE AND BANKING.

DEFLATION. See AGRICULTURE

DE FOREST, LEE (1873-). An American inventor (see VOL. VI). In 1915, he was awarded a gold medal by the San Francisco Exposition for radio telephone. In 1919, he had taken out over 120 patents on radio devices, the most important being the "Audion," a detector, oscillator and amplifier which made possible telephone service both by wire and wireless across the continent.

DEISSMANN, GUSTAV ADOLF (1866-). A German New Testament scholar, professor at the University of Berlin. *Geheimkonstistorialrat* (1916-), member of the Brandenburg Provincial Synod and of the Prussian General Synod from 1914 on (see VOL. VI). He delivered a course of lectures for the clergymen in 1916-17 in Warsaw, Vilna, and Brussels. In 1918, he was for the second time Olaus-Petri Lecturer at the University of Upsala, and the following year became a member of the German Evangelical Synod in Dresden. His works published since 1913 include: *Der Lehrstoff für Religionsgeschichte* (1914); *Der Krieg und die Religion* (1914); *Deutscher Schwertsegen* (1915, 28th ed., 1916); *Inneres Aufgebot* (1st to 3d ed., 1915); *Evangelischer Wochenbrief* (1914-21).

DELACHENAL, JEAN PIERRE FRANÇOIS ROLAND (1854-1923). A French historian. He was born at Lyons, Apr. 5, 1854, and entered in 1879 the French palaeographic institute, the Ecole des Cartes. In 1885, he published a learned *Histoire des Avocats du Parlement de Paris*. His monumental work on Charles V occupied 25 years of labor; three volumes were published from 1897 to 1916, and at his death two additional volumes remained unpublished. Delachenal was also the author of the *Grandes Chroniques de France* (1910-1916-1920). A member of the Academy of Inscriptions (1920), Delachenal was affiliated with a number of learned bodies, including the French historical society and the Royal Society of England, of which he was a foreign correspondent. He died in Paris on Jan. 31, 1923.

DELAGO BAY. See PORTUGUESE EAST AFRICA.

DE LA GORCE, PIERRE-FRANÇOIS-GUSTAVE (1846-). A French historian, born at Vannes and educated at the Institution Saint Jean (Douai) and the University of Paris. He began his career in 1872, at Rocroi, as *juge suppléant*, and held positions subsequently at various places, but he resigned in 1880, finding that he could not follow his conscience in judging cases. He then practiced law for several years, but finally gave that up, too, and devoted himself thereafter to historical studies. In 1895, he was awarded the *prix Alfred Née* by

the French Academy, and in 1900 the *grand prix Gobert*. In 1907, he was admitted to the *Académie des Sciences Morales et Politiques*, and in 1914 was elected to the French Academy, being received in 1917. He belongs to the "classic" school of historians, that is, his writings, while based on solid study, are not annotated. They are literary, and he does not hesitate to express personal opinions. He writes from the point of view of a Roman Catholic and a conservative. His works include, besides contributions to periodicals: *Histoire de la seconde République française*, 2 vols. (1887); *Histoire du second Empire*, 7 vols. (1894-1905); *Histoire religieuse de la Révolution française*, vols. i and ii (1909-12).

DELAND, MARGARET WADE (1857-). An American author (see VOL. VI). She is the author of: *The Hands of Esau* (1914); *Around Old Chester* (1915); *The Rising Tide* (1916, 1918); *Old Chester Tales* (1919. Introduction by Vida D. Scudder); *Promises of Alice* (1919); *Small Things* (1919); *Old Chester Secret* (1920); *The Vehement Flame* (1922).

DELANO, EDITH BARNARD (?-). An American author, born at Washington. She wrote: *Zebedee V* (1912); *The Land of Content* (1913); *The Colonel's Experiment* (1913); *Rags* (1915); *The White Pearl* (1916); *June* (1916); *To-morrow Morning* (1917); *Two Alike* (1918). She also wrote feature photo-plays, and contributed to many magazines.

DELANO, FREDERIC ADRIAN (1863-). An American railroad president (see VOL. VI). He was appointed by President Wilson to the Federal Reserve Board in 1914, but resigned in June, 1918, to join the army. He was commissioned major of the Engineering Corps and assigned to the staff of General Atterbury, director general of transportation at Tours, France. He was promoted to be colonel of the transportation corps in May, 1919, and discharged on Oct. 25, 1919. He was appointed receiver for the Supreme Court of the United States in the Red River Boundary Case.

DELANO, LYMAN (1883-). An American railway official, born in Newburgh, N. Y. He graduated from Harvard in 1906, and began his railway career in 1909 with the A. C. L. R.R., eventually becoming the executive vice-president. He was an official and director in many other railroads and terminal companies. During the period of the War, he was Federal manager for the A. C. L. and other railroads.

DELANO, WILLIAM ADAMS (1874-). An American architect, born in New York City and educated at Yale University and at the Ecole des Beaux Arts in Paris. He began practice in New York in 1903, and from that time until 1910 was professor of design in Columbia University. He collaborated on the plans for the Knickerbocker, Colony and India House club buildings in New York.

DELAWARE. Delaware is the forty-seventh of the United States in size, 2370 square miles, and the forty-sixth in population; capital, Dover. The total population increased from 202,322 in 1910 to 223,003 in 1920, a gain of 10.2 per cent. The white population rose from 171,102 to 192,615, while the number of negroes fell from 31,181 to 30,335. The native white population increased from 153,682 to 172,805; the foreign-born whites from 17,420 to 19,810. The urban population grew from 97,085 to 120,767, while the rural population decreased from 105,

237 to 102,236. The only large city in the State is Wilmington (q.v.), with a population of 110,168 in 1920 as compared with 87,411 in 1910.

Agriculture. While the population of the State showed an increase of 10.2 per cent in the decade 1910-20, the number of farms decreased 6.4 per cent, from 10,836 to 10,140, and the acreage from 1,038,866 to 944,511. The total value of farm property showed an apparent increase from \$63,179,201 to \$80,137,614, and the average value per farm from \$5830 to \$7903. In interpreting statements of comparative values for the decade 1914-24, the inflation of currency in the latter part of the period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. The total percentage of land used for agricultural purposes in 1920 was 75.1, compared with 82.6 in 1910. The percentage of improved farm land increased from 68.7 to 69.1. Of the total of 10,140 farms in 1920, 6010 were worked by owners, compared with 6178 in 1910; 144 by managers, compared with 123; 3986 by tenants, compared with 4535. The white farmers in 1920 numbered 9268, compared with 9914 in 1910; native-born white, 8905, compared with 9504; foreign-born white, 363, compared with 410; Negro, 872, compared with 922. The total number of dairy cows in 1920 was 37,878; 35,708 in 1910. The number of sheep decreased from 4415 to 3220. The estimated production of the chief farm crops in 1923 was: corn, 6143 bushels; wheat, 1,908,000; oats, 176,000; potatoes, 724,000; sweet potatoes, 934,000; and hay, 82,000 tons. Comparative figures for 1913 are: corn, 6,206,000 bushels; wheat, 1,638,000; oats, 122,000; potatoes, 957,000; and hay, 94,000 tons. In 1923, the apple and peach crops were estimated at 859,000 and 203,000 bushels, respectively.

Mining. Delaware has no important mineral resources. Those produced include clay products, sand, gravel, and stone, to a total value between \$350,000 and \$400,000 per year. In 1921 the figure was \$379,785, compared with \$288,516 in 1914.

Manufactures. Delaware is not an important industrial State. The only city of more than 10,000 inhabitants is Wilmington, and the industries of the State are to a large extent concentrated here. This city had 73.3 per cent of the value of manufactured products in 1919. In 1909 there were 726 manufacturing establishments; in 1914, 808; and in 1919, 668. Persons engaged in manufacture in 1909 numbered 23,984; in 1914, 25,533, and in 1919, 32,972. The capital invested increased from \$60,905,671 in 1909 to \$69,323,927 in 1914, and \$148,207,598 in 1919. The total value of products apparently increased from \$52,839,619 in 1909 to \$56,034,966 in 1914, and \$165,073,009 in 1919; but this abnormal increase is due largely to the change in industrial conditions caused by the War, and these figures cannot be used to measure the growth of manufactures between the industrial census of 1914 and 1919. It will be noted that the number of establishments decreased to a large extent in 1919. The most important industries in point of value of products are those connected with the manufacture and tanning of leather. These were valued at \$12,079,000 in 1909; \$9,183,000 in 1914; and \$50,138,000 in 1919. Pulp goods rank second, with a product valued at \$1,032,000 in 1909;

1914, \$2,145,000, and 1919, \$9,385,000. Car construction and repair products in 1909 were valued at \$3,251,000; 1914, \$3,551,000, and 1919, \$7,687,000; and the products of iron and steel, steel work and rolling mills in 1909 at \$1,715,000. In 1914, \$1,669,000; in 1919, \$7,115,000. Wilmington had, in 1909, 261 establishments, with a product valued at \$38,069,000; 1914, 319, with a product of \$39,403,000; and in 1919, 262, with a product of \$121,040,000.

Education. The development of education in Delaware in the decade 1913-23 was slow but steady. As in other southern States the mixture of whites and Negroes in the population adds to the difficulty of educational advancement. In 1919 a new school code was put into effect. A school law, passed by the legislature in 1920 and modified by the Legislature of 1921, provided for a bi-partisan State Board of Education; for improved methods for raising funds for school purposes; consolidation of school districts by referendum vote of the districts involved; continuation of vocational training in agriculture and home economics, and State support of high schools. Sixty scholarships for the training of teachers in the University of Delaware were provided in 1919 by Pierre S. Du Pont and other members of the Du Pont family. The period showed great improvement in the supervision of rural schools and in the provision of industrial training in the colored schools. The enrollment in the public schools increased from 36,000 in 1913 to 39,000 in 1921-22. In the elementary white schools in the latter year 28,278 were enrolled, and in the white high schools 4479, a total of 32,757. In the colored elementary schools 6227 were enrolled, in the colored high schools, 158. The total expenditure for public schools for the year ending June 20, 1922, was \$2,189,032, of which \$1,338,149 was paid to special districts and the remainder expended by the State Board of Education. The percentage of illiteracy in Delaware decreased from 10 in 1910 to 7.4 in 1920; among the native whites, from 4.2 to 2.6; among the foreign-born whites, from 19.7 to 18.2; and among the Negroes, from 32.9 to 24.6.

Finance. For finance, see STATE FINANCES.

Political and Other Events. Political control in Delaware, in the decade 1914-24, fluctuated between the Republican and Democratic parties. In 1914 elections were held for a representative in Congress and for State Treasurer and Auditor. A Republican candidate for the House of Representatives, Thomas W. Miller, was elected. Great industrial prosperity was brought about by the War. Some of the largest ammunition factories in America are located in the State; they received large orders from the warring countries. Several serious explosions occurred in ammunition factories during 1915. In 1916 Josiah Wolcott, Democratic candidate, was elected to the United States Senate, defeating Senator Du Pont, while John G. Townsend, Republican candidate for governor, was elected. In the presidential election of this year Charles E. Hughes received 26,011 votes; Woodrow Wilson, 24,753. In 1918 no elections for State officers were held; L. Heisler Ball, Republican, was elected Senator. Elections were held in 1920 for governor and other State officers. William D. Denny, Republican, won the governorship. In the presidential election of this year, Warren G. Harding received 52,858 votes and James M. Cox, 39,897. In 1922,

Thomas F. Bayard, Democrat, was elected to the United States Senate, defeating Henry A. Du Pont.

Legislation. The most important activities of the State Legislature, which meets biennially, were as follows during the decade 1914-1924. In 1915 an agricultural commission was created. In 1917 the laws relating to the administration of the State government were amended, and so were the child labor laws. A workmen's compensation act was passed, and measures were enacted looking toward the prevention of monopolies and unfair discrimination in the buying and selling of commodities. A commission was appointed to study the educational system of the State and make recommendations for necessary changes. The Legislature of 1919 created a banking department, passed several new school laws, and amended the criminal law of the State. In 1921 the Legislature imposed an income tax for school purposes, amended the law in respect to alien land ownership, provided a tax on shares of banking corporations, established a child welfare commission, amended the laws relating to compulsory school attendance, and adopted legislation for carrying out the educational programme of 1920. This work for education by the Legislature was greatly augmented by gifts worth millions of dollars from Pierre S. Du Pont in university, high school, and graded school buildings and equipment.

DELBET, PIERRE LOUIS ERNEST (1861-). One of the leading surgeons of France. His chief hospital connection was with the Hotel-Dieu, and his principal works are: *Du traitement des aneurysmes externes* (1889); *Des supurations pelviennes chez la femme* (1891); *Leçons de clinique chirurgicale faites à l'Hotel-Dieu* (1899); *Grands procès morbides* (1907); *Méthode de traitement des fractures* (1916). In collaboration, he published: *Affections chirurgicales des artères* (1911, with Moquot); *Maladies de l'anus et du rectum* (1916, with Brechet); *Biologie de la plaie de guerre* (1918, with Fiessinger); *Nouveau traité de chirurgie*, with Le Dentu, which came out serially, the first volume in 1907.

DELBRÜCK, HANS D. L. (1848-). Professor of history at the University of Berlin, *Geheimregierungsrat* (see VOL. VI). In 1920, he became a member of the Historical Committee for the Imperial Archives. His works published since 1913 include: *Regierung und Volkswille* (1914, 1920); *Bismarcks Erbe* (1915); *Krieg und Politik*, 3 vols. (1919); *Geschichte der Kriegskunst*, 4th vol. (1920); *Kautsky und Harden* (1920); *Ludendorff, Tirpitz, Falkenhayn* (1920); *Ludendorffs Selbstportrat* (1922).

DELCASSÉ, THÉOPHILE (1852-1923). A French statesman. In 1913-14 he served as Ambassador at Petrograd, and from 1914 to 1915 was Minister of Foreign Affairs. He had previously served in this capacity in 1912. He was recognized as one of the most eminent of French statesmen, and was best known as the founder of the Entente.

DELITZSCH, FRIEDRICH (1850-). A German Assyriologist (see VOL. VI) professor at the University of Berlin, member of the Akademie der Wissenschaften. His works published since 1913 include: *Sumerische Grammatik* (1914); *Sumerisches Glossar* (1914); *Die Grosse Tauschung* (1920; Part 2, 1921,

1922); *Lese-und Schreibfehler im Alten Testament* (1920).

DELL, FLOYD (1887-). An American novelist and critic, born at Barry, Ill. He entered the field of journalism at the age of 18 and in six years was the literary editor of the *Chicago Evening Post*. In 1914, he went to New York to associate himself with Max Eastman in the publication of *The Masses*, a periodical with a radical economic policy and an excellent literary department. Early attempts at writing did not reveal his true métier, but the publication of his novel *Mooncalf* (1920) proved him a fictionist of the highest rank. He followed the success of this work with *The Briary-Bush* (1921). These together made a full-length portrait of the American youth of the period: ambitious, curious, aesthetically-minded, but thwarted by the hostility of his environment and his own sentimental heritage. *Janet March* (1923) was a less successful attempt to do the same thing for the young American woman. Other books included: *Were You Ever a Child?* (1919); *Looking at Life* (1924).

DELORME, EDMOND (1847-). A French surgeon, surgeon-general of France before and during the recent War. Many years before the outbreak of hostilities he published his great work *Traité de chirurgie de guerre* in two volumes (1888-1893). When war was declared in 1914, he promptly issued his manual, *Précis de chirurgie de guerre*, which was translated into English for the British Army in 1915. In the midst of the War, he published *Chirurgie de guerre—fractures* (1917); and at the close of the War, *Les enseignements chirurgicaux de la grand guerre* (1919).

DEMILLE, CECIL B (LOUNT) (1881-). An American actor and motion-picture producer, educated at the Pennsylvania Military College and the American Academy of Dramatic Arts. After being successively playwright, actor and theatrical producer, after 1914 he devoted himself entirely to production for the moving pictures. His best work includes: *Girl of the Golden West*; *The Warrens of Virginia*; *Carmen*; *Joan of Arc*; *The Dream Girl*; *The Woman God Forgot*; *The Devil Stone*; *The Whispering Chorus*; *Don't Change Your Husband*; *For Better, For Worse*; *Male and Female*; *Why Change Your Wife*, *Something to Think About*; *The Affairs of Anatol*; *Fool's Paradise*; *Manslaughter*; *The Ten Commandments*, and *Triumph*.

DE MORGAN, WILLIAM FREND (1839-1917). An English novelist (see VOL. VI). *The Old Madhouse* was published posthumously in 1919, and *The Old Man's Youth*, De Morgan's incomplete novel, was published, with additions by his widow, in 1921.

DEMPESEY, JACK (1896-). World's heavyweight boxing champion, born as William Harrison at Manassa, Colo. He began his pugilistic career in 1915 and four years later defeated Jess Willard for the world's title at Toledo, Ohio. He has since successfully defended his laurels against many aspirers to the pugilistic throne, including Georges Carpentier, Tom Gibbons and Luis Firpo. He knocked out Carpentier in the fourth round of a scheduled 15-round bout at Boyle's Thirty Acres, New Jersey, in 1921 and won on a decision from Gibbons at Shelby, Montana, in 1923. His most spectacular battle was with Firpo at the Polo Grounds, New York City, which also oc-

curred in 1923, Dempsey winning by a knock-out in the second round after having been knocked from the ring himself by his opponent in the first round.

DE MUYTER, ERNEST (?-). A Belgian airman, contestant for the Gordon Bennett International Balloon Cup for several years. He won the Balloon race and the Cup in 1922 and again in 1923.

DENBY, EDWIN (1870-). An American lawyer, born at Evansville, Ind. As a boy he went to Pekin with his father, then minister to China, and served in the Maritime Customs Service during 1887-94. He then returned to the United States, was graduated in law at the University of Michigan in 1896, and was admitted to practice in the same year. In 1903, he was a member of the Michigan House of Representatives, then was elected from the First Michigan District to Congress, serving during 1905-11. During the war with Spain, he was a gunner's mate on the *Yosemite*, and when the United States entered the recent war, he enlisted as a private in the United States Marine Corps, becoming a major on the Reserves' list in that corps. By appointment of President Harding, he became Secretary of the Navy in March, 1921, but in response to a request from Congress to President Coolidge, he resigned from his office in March, 1924, and returned to Detroit, where he resumed the practice of his profession.

DENGEL, PHILIPP IGNAZ (1874-). German philosopher and professor of general history at the University of Innsbruck. He was born at Elbigenalp in the Tirol, and studied at the universities of Innsbruck and Berlin. He was elected member of the Austrian Historical Institute of Rome and specialized on Italian history and politics. His principal works are: *Geschichte des Palazzo di San Marco in Rom bekannt als Palazzo di Venezia* (1909); *Die verschollene Mappa mundi im Palazzo di Venezia* (1912); *Der italienische Irredentismus* (1912); *Palast und Basilica di San Marco* (1913); *Die Sudgrenze Deutsch-Tirols* (1919); *Italien auf falschem Wege* (1919); *Südtirol im Lichte des italienischen Irredentismus, Nationalismus und Imperialismus* (1919).

DENIKIN, ANTON (1872-). A Russian soldier. After years of service in the Russian armies, he was Chief of the General Staff under Generals Alexeiev and Brussilov during the War. Following the Russian revolution, he was placed in command of the western front, succeeding General Gourko in June, 1917. He was commander of the southwestern front during the advance of General Kornilov against Kerensky, in September, 1917, and following the death of the latter took command of the volunteer force, which in Mar. 26, 1918, captured Kuban. He assembled an army against the Soviet government, which included about 100,000 men. In February, 1919, he took the offensive, and by November had established a fighting front from which he advanced a considerable distance in the interior of Russia. In February, 1920, he was completely defeated by the Soviet army and his forces were dispersed.

DENIS, MAURICE (1870-). A French painter born at Granville, Manche, who was to become one of the so-called Symbolists. He studied at the Ecole des Beaux Arts and was strongly influenced by Paul Serusier, who favored synthesis and the use of form and color

to express subjective states of mind. He was also one with the Rose Croix group who favored idealist decorative art rather than realism. In 1894, a visit to Italy impressed him with the value of Italian quattrocento art and influenced his work to a large extent. He found the subjects for most of his important murals in religious pieces and classical mythology. Besides murals, he has executed many easel pictures and has illustrated books and contributed to art reviews. In 1902, he was made a full member of the Société Nationale and in 1910 he became Chevalier de la Légion d'Honneur. His most important pieces have been exhibited at the Salon des Indépendents and the Salon d'Automne, and he is also represented in the Luxembourg, Paris.

DENISON UNIVERSITY. A coeducational Baptist institution founded in 1830 at Granville, Ohio. The student enrollment increased from 575 in 1914 to 978 in 1924, and the number of members in the faculty from 43 to 69. The productive endowment in 1924 amounted to \$2,250,000. Marsh Hall, which was partially destroyed by fire in 1918, was fully reconstructed; Swasey Chapel, seating 1300, was partly built in 1924, and funds were in hand for the construction of the Helen Arnett Whistler Memorial Hospital. Col. Edward A. Deeds gave a large tract of land to enlarge the campus and built the Deeds athletic field with its concrete stadium seating 6000 persons and field house equipped with dressing rooms, showers, etc. President, Clark W. Chamberlain, Ph.D., LL.D.

DENMARK. The smallest of the Scandinavian countries, whose area, by the accession of North Schleswig (q.v.) in 1920, was increased to 16,604 square miles, and whose population, by the census of Feb. 1, 1921, was 3,267,831. The increase in population over the last census period was distributed evenly between the rural and urban centres. The population of the capital, Copenhagen, was 561,344, in 1921. Other large towns are Aarhus, 74,256; Odense, 49,469; Aalborg, 71,613; Horsens, 27,588; and Randers, 26,495. The population growth was

dependent on its export trade in dairy products and pork particularly. After the War recovery was rapid, though no advance was discernible up to 1924 over the pre-war years. In 1922 there were 575,773 horses, 2,525,348 cattle, 441,875 sheep, 1,899,019 swine, and 19,100,000 hens; in 1910, 535,018 horses, 2,253,982 cattle, 726,829 sheep, 1,467,822 swine, and about 15,000,000 hens. In 1922, 237,180 acres were under wheat, 546,660 rye, 666,217 barley, 1,117,902 oats, and 204,206 potatoes. Though harvests were large, the drop in prices following the depression of 1921 reacted unfavorably on every branch of industry. Grains were selling in December, 1922, for 50 per cent less than the December, 1920, figures. The same drop was to be traced all along the line.

Industry. Small plants were the rule. In 1914 factories numbered 82,442; in 1906, 85,242. Here were employed in 1912 346,000 hands; in 1906, 317,086. Because of the demands of belligerents during the War, manufacturing activity increased considerably, but the world-wide depression of 1921 brought the country back to its pre-war status. The production of margarine, one of the most important industries, increased somewhat; in 1921 the output was 55,740 tons, compared with a 1911 output of 35,400 tons.

Commerce. The trade record for typical years follows, in millions of kroner; value, \$268.

Year	Imports	Exports	Average exchange rate
1914	795	867	\$0.2625
1917	1,082	1,065	2959
1920	3,142	1,814	1577
1921	1,697	1,564	1779
1922	1,448	1,173	2095

In 1922, animals to the value of 47,270,000 kroner were exported; provisions to the value of 917,439,000 kroner; and cereals to the value of 379,000 kroner. Exports and imports by countries for typical years, in thousands of kroner, were:

IMPORTS				EXPORTS			
Country	1912	1920	1921	Country	1912	1920	1921
United Kingdom	135,887	887,549	305,360	United Kingdom	87,812	671,981	825,552
Germany	314,246	532,219	461,748	Germany	181,646	326,471	211,187
Sweden	69,060	189,904	97,989	Sweden	33,852	358,270	139,351
Russia	56,175			Russia	16,347		
United States	58,833	753,666	342,597	United States	10,568	90,719	42,761

about 1 per cent annually. Emigration was chiefly to the United States, 6300, in 1920; in 1921, 5309; in 1922, 4300. The pre-war yearly average was 9000. North Schleswig has an area of 1538 square miles and a population of 164,500. The Faeroe Islands count 21,364 inhabitants and an area of 540 square miles.

Agriculture. A movement from the land to the cities was shown in Denmark, the tillers of the soil dropping from 40 per cent of the total population in 1900 to less than 35 per cent in 1921. The movement toward the creation of small holdings continued; the law of 1919, in particular, aimed at the parcelling up of large estates held in entail. Intensive cultivation and dairy farming made continued headway through the initiative of the cooperative societies. The War of course dealt Denmark's agriculture a severe blow, for its prosperity was

In March, 1923, 2082 vessels of 1,070,218 tons were flying the Danish flag; 628 of these were steamers. During the War official figures put the shipping losses due to submarine attacks and mines at almost 150 ships, of 230,000 tons. In 1920, 23,038 vessels of 3,269,268 tons entered Danish ports and 23,944 vessels of 1,030,954 tons cleared. A sign of renewed activity was the fact that in 1922, 13,700 vessels of 3,850,000 tons entered Copenhagen alone. Important maritime activities included the opening of the Odense Canal in 1921 and the commencement in 1922 of the Drogden, a channel for larger ships between the North Sea and the Baltic.

Communications. At the end of 1920 the country had 4713 miles of road, with 23,654 miles of by-ways. Railways totaled 2662 miles. The length of state telegraph lines was 9531 miles. By means of radio-telegraph stations at

Lynby, Blaavand, Copenhagen, and Amager, Denmark is in touch with ships at sea and with the United States.

Finance. The 1923-24 budget carried 399,900,680 kroner for revenue and 362,147,031 kroner for expenditure. Of the latter, 53,397,554 kroner went toward meeting the interest and expenses on the state debt. In 1922 the total debt stood at 1,235,317,000 kroner; the 1913 figure was 348,040,923 kroner.

History. The cost of living as measured by retail prices gradually rose so that in 1921 it more than doubled that of the last pre-war year. Based on prices for 1913 considered as 100, the index number for October, 1920, reached 403, but by October of the next year it had fallen back to 202. Wages, too, kept pace with prices up to 1921. The high degree of organization of both employers and employees in industry, about 280,000 workers belonging to the Combined Trade Unions made up of factory and agricultural workers, accounted for the marked stability. In the years following the War considerable unrest appeared among the transport workers, but this abated after 1921. Denmark followed in the wake of other countries of northern Europe in establishing elaborate agencies for social insurance in industry. Illness and unemployment pensions and old-age pensions were either in whole or in part state aided. The budget of 1923 carried 15,346,000 kroner for pension charges alone. A comprehensive compensation act was passed in 1916. The state contributed to the unemployment fund of the trade unions.

During the War, because of her proximity to the belligerents, Denmark's position was precarious. Early in August, 1914, it was found necessary to fix prices and regulate exports to prove the country's desire for a real neutrality. In the War atmosphere parties quickly came to terms, and the revision to the constitution which had long been agitated was agreed on. On June 5, 1915, the new constitution was signed by the King, and amendments were promulgated on Sept. 10, 1920. Voting is universal; proportional representation is employed; and the King may not declare war without the consent of Parliament. The sovereign power is vested in the King through his ministers.

The tightening of the submarine campaign in 1917 brought renewed hardships to the Danish population. Rationing was resorted to, and state and local agencies contributed extensively to poor and unemployment relief. Large sums had to be spent on military defense as well. The result was that the government was compelled to resort to loans to make up deficits appearing annually in the budget. The Danish period of reconstruction did not escape the difficulties which other countries experienced. The demobilization of the troops and the break in the foreign market augmented unrest. German competition, made possible by the low value of the mark, naturally added to the uncertain economic conditions. The country's foreign trade received a severe blow in 1922 when the United States emergency tariff imposed prohibitive rates on Danish goods. By 1922, agriculture had almost reached the normal; eggs, butter, and bacon showed a remarkable recovery. Late in August, 1922, the figure of unemployed had fallen to 30,000. But that the country was not to weather the depression of 1921-22 easily was shown when the Danish Landmandsbank, the

most important Danish banking institution, suddenly collapsed in September, 1922. Its interest in business built on the high price levels of the preceding years worked its undoing, with the result that it became incumbent on the government to effect a reorganization. Ninety million kroner of the outstanding capital had to be written off, while the Danish National Bank was called on to contribute 30,000,000 kroner toward the bank's new surplus. The result was that public confidence was diverted more and more from private banking and centred in the Danish National Bank. Of a piece with the economic distress was the renewed interest in emigration schemes. Plans were launched in 1922 for the settlement of Danish colonies in Madagascar, Lithuania, and Central and South America.

After a bitter political contest, a plebiscite in December, 1916, approved the sale of the Danish West Indies or Virgin Islands to the United States for \$25,000,000. A further diminution of the Danish Empire took place in 1918 when Iceland (q.v.) was granted its independence; thenceforth Iceland and Denmark were connected only by a personal union under the Danish King. Greenland (q.v.) alone remained a colonial possession. In 1920 Denmark regained part of the province of Schleswig which had been wrested from her by Prussia in 1864. The Peace Treaty provided for two plebiscites in North and Central Schleswig respectively, and under an international administration they were held in February and March, 1920. The result was favorable for Denmark in North Schleswig, the vote being 75,000 for union, and 25,000 against; while in the Central district the natives decided by a vote of 51,000 to 12,000 to remain a part of Germany. On Sept. 21, 1920, citizens of Schleswig took part in the Danish general elections for the first time. The parties returned to the lower house numbered 52 Liberals, representing the farmers; 18 Radicals, representing the small landholders; 48 Socialists, representing the city workers; 27 Conservatives, sitting for the middle class; 3 Trade party; 1 Schleswig (German party). The ministry therefore was formed by the Liberals. The Liberal Premier Neergaard, supported by a parliamentary bloc, remained in power during the troublesome reconstruction years, and was not overthrown until 1924, when parliamentary elections gave victory to the Labor party despite the inclusion of a capital levy plank in its platform. After the Labor victory at the polls, a Labor Cabinet was formed under the premiership of Theodore Stauning. See SCANDINAVIAN LITERATURE; EXPLORATION; NAVIES OF THE WORLD.

DENNERT, EBERHARD (1861-). A German writer on nature and popular philosophy, who was born at Putzerlin near Staargard, Pomerania. He studied at the universities of Marburg and Bonn, and was successively assistant at the Botanical Institute of Marburg, director of the Keplerbund, and editor of the nature department of the *Deutsche Encyclopädie*. Among his numerous works are: *Moses oder Darwin* (1907); *Haeckels Weltanschauung naturwissenschaftlich beleuchtet* (1908); *Die Zelle ein Wunderwerk* (1909); *Die geschichtliche Entwicklung der Descendenztheorie* (1910); *Die Welt für sich und die Welt mit Gott* (1913); *Mehr Naturfreude für die Jugend* (1914); *Gibt es ein Leben nach dem Tode?*

(1915); *Gott, Seele, Geist, Jenseits* (1916); *Not und Mangel im Lichte der Entwicklung* (1916); *Der Staat als lebendiger Organismus* (1920).

DENNETT, TYLER (1883-). An American author, born at Spencer, Wis., and educated at Bates College and at Williams College. From 1914 to 1916, he was associate editor of *The World Outlook*. He directed the publicity of the Methodist centenary (1916-18), and in 1919-20 held the same position in the Inter-Church world movement. He is also known as a lecturer on Asia, having traveled widely in the Orient and in Africa. He is author of *The Democratic Movement in Asia* (1918) and of *A Better World* (1920).

DENNIS, ALFRED P. (1869-). An American diplomat, born in Worcester Co., Md., and educated at Princeton University. During the period 1894-1907, he was professor of history at Wesleyan University (Conn.) and at Smith College. In the latter year, he resigned because of ill health, and became engaged in the mercantile business. In 1918, he was commercial attaché at the American Embassy at Rome, and in 1921 held the same post in London. As a representative of the Department of Commerce, he made investigations for Herbert Hoover in Central and Eastern Europe (1922). A student of political history and economics, he has made frequent contributions on those subjects to the *Atlantic Monthly*, the *Yale Review*, *International Journal*, *Saturday Evening Post*, etc.

DE NOAILLES, COUNTESS ANNA (1870-). A French poet and novelist. She was born Princess de Brancovan, and married Count Matthieu de Noailles. Her poetry is characterized by romantic naturalism, and she earned the title "Muse of the Gardens." As a novelist also she is the apostle of sentiment and sensation. Her poetic works include *Le Cœur Innombrable*, *L'Ombre des Jours*, *Les Vivants et les Morts*, *Les Eblouissements*, and *Les Forces Éternelles*; her works of prose include three novels, *La Nouvelle Espérance*, *La Domination*, and *Le Visage Éternel*.

DENTISTRY, MODERN. See **RHEUMATISM, CHRONIC.**

DENVER. The capital of Colorado and the largest city between the Missouri River and the Pacific Ocean. The population rose from 213,381 in 1910 to 256,491 in 1920 and to 272,031 by estimate of the Bureau of the Census for 1923. In 1916, after three years' trial of the commission form of government, Denver went back to the mayor and council form. The new charter provided for a small council of nine men, and assigned wide powers of appointment and removal to the mayor. The library system was extended during the decade by the addition of branch libraries. After years of struggle between the city and the Denver Union Water Company and its predecessors over franchises, rates and valuation, and projects for building municipally owned works, an agreement for purchase was made between the company and the city in 1918, and ratified by popular vote. Zoning and city planning provisions were being put through in 1924, and a programme of paving carried on within the city and connecting Denver with all of the principal towns in a radius of several miles. The value of manufacturing increased from about \$70,500,000 in 1913 to \$125,411,000 in 1924, and

the number of establishments from 738 to 1147. According to the census figures of 1920 there were on an average 16,635 wage earners, an increase of 50 per cent over the figures for five years earlier. The value of the packing business increased during the 10 years by 234 per cent.

DENVER, UNIVERSITY OF. An institution at Denver, Colo., under the auspices of the Methodist Episcopal Church, founded in 1864. The enrollment of the university practically doubled between 1913, when it was 1150, and the year 1923-24, when it was 2188. The faculty increased from 132 in 1918 to 150 in 1923-24, and the library from 38,000 to 50,000 volumes. Henry A. Buchtel, D.D., LL.D., was chancellor until 1921, and Heber Reece Harper became chancellor in 1922. During the interim Wilber D. Engle was acting chancellor.

DEPAUW UNIVERSITY. A coeducational institution at Greencastle, Ind., under the auspices of the Methodist Episcopal Church, founded in 1837. DePauw grew steadily during the decade 1913-1923, increasing its student body from 1000 in 1913 to 1485 in the year 1923-24, with 196 in the summer school of 1923; it added 10,880 volumes to its library and thereby brought the total number of volumes in 1923 up to 58,880. The faculty was enlarged from 50 to 68. The equipment of the university was augmented by the erection of Rector Hall, a dormitory for women, and the Clem Studebaker Memorial Administration Building. The productive funds were increased from \$1,300,000 to \$3,930,000, and a campaign to add \$1,000,000 more for endowment and \$500,000 for increased equipment was nearing completion in 1924. President, George Richmond Grose, D.D., LL.D.

DEPENDENTS, DEFECTIVES, DELINQUENTS. See **CHILD WELFARE; MOTHERS' PENSIONS; and JUVENILE COURTS.**

DEPEW, CHAUNCEY MITCHELL (1834-). An American politician (see Vol. VI). In 1914, he was in favor of the repeal of the Panama Canal tolls bill. He was violently opposed to pacifism from the outbreak of the War, and in 1915, on the occasion of the sinking of the *Lusitania*, urged drastic measures against Germany. After 1913 he published *Some Views on the Threshold of Fourscore* (1914), and *Speeches and Literary Contributions at Fourscore and Four* (1918).

DEPTH BOMB. See **BOMB, DEPTH.**

DERBY, EDWARD GEORGE VILLIERS STANLEY, SEVENTEENTH EARL OF (1865-). An English statesman born in London. He was educated at Wellington College, and later received valuable experience as lieutenant grenadier of the Guards during the period 1885-95, and as aide de camp to the Governor-General of Canada. He was a Lord of the Treasury (1895-1900), chief press censor in South Africa (1900), Financial Secretary to the War Office (1900-03), Postmaster-General (1903-05), member of Parliament from West Houghton Division of Lancashire (1892-1906), and Director-General of Recruiting (1915-16). During the War he had an admirable scheme for recruiting on the basis of voluntary service, but as the number of volunteers did not equal expectations, the plan was abandoned. In February, 1916, he became chairman of the military air service joint committee, from which office he resigned two months later, and in July of the

same year, upon the formation of Lloyd George's government, he accepted the secretaryship of War. In 1918, he was appointed ambassador to France, from which post he resigned in 1920.

DERCUM, FRANCIS XAVIER (1856-). An American neurologist (see VOL VI). He published *Hysteria and Accident Compensation* (1916); *An Essay on the Biology of Mind* (1922); *The Biology of Internal Secretions* (1924).

DESCAMPS, BARON EDOUARD (1847-). A Belgian jurist (see VOL. VI). After 1913, he published, with others: *Recueil international des traités du 19e siècle*, vol. i, 1801-25 (1914); *Recueil international des traités du 20e siècle*, vol. vi, 1906 (1914).

DESCAVES, LUCIEN (1861-). A French man of letters (see VOL. VI). His recent works include: *Bribu* (1911); *Ateliers d'aveugles* (1912); *Philémon* (1914); *La Maison anaiseuse* (1916); *Dans Paris bombardé* (1919); *La Saignée*.

DESCHAMPS, ALBERT. See PSYCHOLOGY, ABNORMAL.

DESCHANEL, PAUL (EUGÈNE LOUIS) (1856-1922). A French statesman and author (see VOL. VI). In January, 1920, he was elected President of France, but his health soon began to fail, and in May a singular accident happened when he was on a train near Montargis. He fell from the window, and though his physical injuries were not serious, he never recovered from the nervous shock, and finally was obliged to resign the Presidency. Though he afterwards appeared in the Senate for a short time, his career was practically over.

DES MOINES. The capital of Iowa. The population increased approximately 46 per cent, from 86,368 in 1910 to 126,468 in 1920, and to 140,923, by estimate of the Bureau of the Census, for 1923. Between 1914 and 1924, the State Capitol park was increased from 18 to 83 acres by the razing of several city blocks, and a new municipal court and public safety building was erected on the river front civic centre. A diagonal boulevard, Keosauqua Way, was constructed, connecting the business district with the northwest residential section, and Fifth Avenue was widened and graded, at a cost for the two projects of more than \$1,000,000. Locations for new units of the public school system were purchased and a building programme was partially completed, involving a final cost of approximately \$7,000,000. The city bought the water plant in 1919. Twenty-six banks reported clearings of \$568,487,000 for 1923, 400 factories, capitalized at \$50,000,000, employed 10,000 persons and turned out \$80,000,000 worth of merchandise.

D'ESPEREY, LOUIS FRANCHET (1856-). A French marshal, born in Motaganem. He saw service in North Africa and elsewhere, and in 1914 was given command of the 1st Corps in the 5th French Army. Here he did distinguished service in attempting to hold back the German advance in the retreat from Mons, in September, 1914, and succeeded General Lanzerac in command of the 5th Army before the first battle of the Marne. In this battle, he performed brilliant services. In 1916 he was given command of the group of Eastern armies in France. In 1917 he commanded the group of Northern armies, and in 1918 was made

commander-in-chief of the Allied Forces in Salonica. He organized, with great skill, a general attack of the armies, and on December 15 carried this out with success. This was followed by the surrender of Bulgaria. He was in charge of the Allied Forces in Eastern Turkey and the Balkans in 1919, and in 1921 was created marshal.

DESSOIR, MAX (1867-). A German psychologist, born at Berlin. He was educated in the German universities and passed through the academic *cursus honorum*, becoming professor at the University of Berlin in 1920. As editor of the *Zeitschrift für Ästhetik und allgemeine Kunstwissenschaft*, he was one of the leaders in the empirical study of the principles of taste. He was also interested in the various phases of abnormal psychology and psychological research, and published his findings in a volume on *Jenseits der Seele* (On the Other Side of the Soul, 1920). His *Geschichte der Psychologie* (1911) was translated into English under the title of *History of Modern Psychology*. Among his other works are *Eine Bibliographie des modernen Hypnotismus* (1890), *Das Doppel-Ich* (1896), *Geschichte der neueren deutschen Psychologie* (1903), *Ästhetik und allgemeine Kunstwissenschaft* (1906), and *Philosophisches Lesebuch* (1911).

DESTROYER. See VESSEL, NAVAL.

DETLEFSEN, JOHN A. (1883-). An American zoölogist born at Norwich, Conn. He was educated at Dartmouth and at Harvard. He was Austin teaching fellow of Harvard (1908-12) and was at the University of Illinois as assistant professor of genetics (1912-18), associate professor (1918-19) and professor (1919-). Professor Detlefsen wrote on genetics, especially in domesticated animals.

DETONATORS. See EXPLOSIVES.

DETROIT. The 1914 area of the incorporated city of Detroit in Michigan was 41.76 miles. In 1924 it was 92.66 miles; 10 extra square miles of area were in process of annexation. Within the city and entirely inclosed by the corporate limits are two independently incorporated cities, Highland Park with a population of 56,000 and Hamtramck with a population of 75,000. The Federal census of 1910 gave Detroit a population of 465,766 Highland Park, 46,499, and Hamtramck, 3559. The Federal census of 1920 gave Detroit 993,729; Highland Park, 46,499, and Hamtramck, 48,615. Growth during the four years since the Federal census was taken has been fully as rapid. The figures for 1924 are based on estimates made by the Water Board, the gas company, and the R. L. Polk Directory Company, which makes a thorough canvass of the cities each year. The estimated population of Detroit in 1924 was 1,250,000. The village of Oakwood had been annexed. Adjoining the corporate limits of the city were the following independent municipalities, all within 12 miles of the city hall: Grosse Pointe Park, 3000 population; Ecorse, 5500; River Rouge, 14,500; Ferndale, 12,000; Springwells, 8000; Lincoln Park, 7000; Pleasant Ridge, 1500; Redford, 5500; Royal Oak, 12,500; Dearborn, 4500; and Brightmoor, 4000.

Among many public works constructed since 1914 are the new Belle Isle Bridge, costing \$3,000,000; the new public library, \$3,000,000; and the Detroit Institute of Arts, now under construction, to cost about \$3,000,000. From

1914 to 1924 the pumping capacity of the city water works was practically doubled, and a general installation of meters led to a more considerate and economical use of water. In 1914 there were 917 miles of water mains; the 1924 mileage is 1943 miles. During 1923 a new filtration plant was put in operation, with a capacity of 180,000,000 gallons daily, at a cost of \$4,500,000. The per capita water consumption in 1923 was 141 gallons per day. On July 1, 1923, the Water Board estimated that it was supplying 1,248,900 persons with water. In 1914 the public works department reported 227 miles of public sewers and 565 miles of lateral sewers. On Aug. 1, 1924, there were 1169 miles of public sewers and 1924 miles of laterals. The police department was provided with a new headquarters building at a cost of \$1,700,000. In 1914 the department had 1125 uniformed men and 112 others in service. In 1924 the uniformed force numbered 2387 and the office staff 138. The fire department in 1914 employed 729 men; in 1924 the fire-fighting force numbered 1261; the total force, 1467. Detroit had 51 public parks containing 1990 acres; 59 playgrounds containing 219 acres; 66 street playgrounds, 16 swimming centres; 46 public tennis courts; 31 baseball diamonds; 15 football fields, and other recreation facilities. The River Rouge improvements, including dredging and new bridges, cost about \$10,000,000. The first big freighter, with a cargo of iron, passed up to the Ford plant on July 2, 1923.

The total value of Detroit's manufactured products in 1914 was \$400,348,000. In 1919 the total value of the manufactures of Detroit proper was \$1,234,519,842. The total value of manufactures in the metropolitan district was \$1,803,728,219. The total value of Detroit products in 1923 was a little over \$2,000,000,000. The metropolitan district includes the two cities of Hamtramck and Highland Park. In 1919 there were 2176 manufacturing plants in the city proper, with a capital investment of \$788,329,200; 167,016 wage earners; 29,639 salaried officials, receiving salaries and wages aggregating \$297,884,461. In the metropolitan district there were 2256 establishments with capital of \$1,230,470,739; salaried officials, 34,928; employees 231,645, receiving \$419,774,189 in salaries and wages.

The banks of Detroit in 1914 had aggregated capital and surplus to the amount of \$30,030,000 and savings deposits of \$88,704,876. On June 30, 1924, the combined capital of State and National banks of the City was \$33,950,000; surplus, \$32,042,000; savings deposits, \$308,568,738; total deposits, \$586,473,338; total resources, \$713,766,686; total clearances of banks associated in clearing house in 1923, \$6,691,595,579.

In April, 1922, the city of Detroit voted an authorization of the purchase of the street railway lines of the Detroit United Railway Company for \$19,850,000, with the full understanding that the price was excessive, but that the termination of 30 years' dissatisfaction would be worth it. The city began operation of the lines on May 1. The trackage purchased was 311 miles, and considerable valuable real estate and plant went with the purchase. The city added 72 miles of new line to the system, and service in 1924 was furnished by 1594 cars and 6463 employees. Paying \$500,000 of the purchase price every six months, the city had

paid \$4,700,000 of this debt up to the middle of 1924.

The assessed valuation of property in the city of Detroit in 1914 was \$325,856,000; tax levy of 1914, \$10,267,999; tax rate, \$19.69 per \$1000. Assessed valuation in 1924, \$2,455,327,680; tax levy, \$51,476,676; tax rate, \$20.96 per \$1000. Bonded debt of 1914, \$16,656,000; bonded debt of 1924, \$137,428,430.

In 1914, 7884 buildings were erected, valued at \$28,427,140; 1915, 9006 buildings, \$32,235,550; 1916, 16,490 buildings, \$51,067,110; 1917, 12,108 buildings, \$39,676,690; 1918, 7010 buildings, \$18,201,707; 1919, 21,473 buildings, \$82,995,071; 1920, 19,412 buildings, \$77,737,365; 1921, 17,615 buildings, \$38,087,081; 1922, 25,460 buildings, value, \$94,615,093; 1923, 35,234 buildings, \$129,719,731. For the first six months of 1924, building permits for 25,620 buildings aggregating \$99,299,884. Summary for 10 years: 197,312 buildings; aggregate cost, \$712,062,422.

The census of persons of school age from 5 to 20 years, inclusive, in the city of Detroit proper in 1914 was 133,339; the registration in the public schools was 69,086. In 1924 the school census gave 284,693 persons of school age, and the registration in the public schools was 162,807. From 1914 to 1924 the Board of Education erected 36 elementary schools, 8 intermediate schools, and 5 high schools. The total increase of public schools since 1914 is 67 elementary schools, 5 intermediate schools, and 4 High schools. The total cost of new school buildings and additions, 1914-24, was \$30,454,903. The public expenditures for school purposes in 1914 amounted to \$4,186,864; in 1924, \$20,290,999. The value of the public school plant in 1914 was \$9,325,673; in 1924, \$54,729,427.

DETROIT, UNIVERSITY OF. An institution under the auspices of the Roman Catholic Church, founded in 1875 at Detroit, Mich. The enrollment of the university increased rapidly, from 792 in 1918 to 1500 in the college and technical schools and 500 in the high school in the year 1923-24. The faculty was correspondingly increased from 69 to 165 members and the library from 18,000 to 38,000 volumes. A day school of commerce and finance, as well as night courses in journalism, short story writing and social service work, were added in 1922. The institution is conducted by the Fathers of the Society of Jesus, whose services, as well as those of several lay professors, are given gratis. About \$350,000 toward a building fund had been gathered by the trustees at the end of 1923. John P. McNichols, S.J., Ph.D., succeeded the Rev. William T. Doran, S.J., as president in 1921.

DEUSSEN, PAUL (1845-1919). A German philosopher and Orientalist (see Vol. VI). He completed his *Allgemeine Geschichte der Philosophie* in 1917. His autobiography was published posthumously in 1922 by his widow, Erika Rosenthal-Deussen.

DE VALERA, EDWARD (EAMONN) (1882-). An Irish Republican leader born in Charleville, County Cork, Ireland, and educated at the Christian Brothers' School (Charleville), Blackrock College, and the Royal University of Ireland. He taught mathematics and languages at several of the Catholic Colleges of Ireland, and was generally well liked. In 1916, three years after the founding of the Irish

Volunteers, De Valera, always deeply interested in the cause of Irish freedom, threw himself whole-heartedly into the movement, and in the rebellion of that year commanded the insurgents at Boland's bakery, Dublin. Orders compelled him to surrender on April 30, and he was sentenced to death, but the sentence was later commuted to life imprisonment. He was released, however, in the general amnesty of June 15, 1917. What importance he had achieved as the surviving leader of the Easter Rebellion, as it was called, became recognizable in the large majority he received in his election for East Clare. Henceforth De Valera devoted his entire time to the Sinn Feiners and at the convention of October, 1917, was elected President of the Irish Republic. In the following spring he was rearrested for the part taken in the agitation against "conscription" and in a plot for another rebellion coupled with a German invasion. In February of 1919, he escaped from the prison at Lincoln, England, and finally made his way to the United States, where he enlisted much sympathy from many of the Roman Catholic Irish and in German-American centres. He returned to Ireland in 1921, and negotiations for an Irish settlement were begun with the British government. In the same year, he became chancellor of the National University of Ireland. See IRELAND, *History*.

DEVINE, EDWARD THOMAS (1867-). An American leader in social work (see VOL. VI). In 1916, he was special agent at the American Embassy in Petrograd. Recent books published by him include: *The Normal Life* (1915), *Disabled Soldiers and Sailors* (1919), and *Social Work* (1921).

DEVONPORT, HUDSON EWBANKE KEARLEY, first Viscount (1856-). An English politician and business man, born at Uxbridge, and educated at Cranleigh School. He entered the firm of Kearley and Tonge, subsequently becoming a senior partner. In 1892, he entered Parliament as Liberal member for Devonport (1892-1910). He was parliamentary secretary to the Board of Trade (1905-09), was chairman of the Port of London Authority (1909), first Food Controller (1916), and Secretary to the Sugar Commission (1917). He was created a baronet in 1908, was raised to the peerage in 1910, and in 1917 was created a viscount.

DEVONSHIRE, VICTOR CHRISTIAN WILLIAM CAVENDISH, ninth Duke of (1868-). A British statesman educated at Cambridge. He entered Parliament in 1891. He was civil lord of the Admiralty in 1915-16, and Governor-General of Canada 1916-21, and in 1922, he became Secretary of State for the Colonies.

DEVORE, DANIEL BRADFORD (1860-). An American soldier, born in Monroe Co., Ohio. He graduated from the United States Military Academy in 1885, and was commissioned 2d lieutenant in the same year. He served during the Spanish-American War as captain of volunteers and was commissioned captain of the Regular Army in 1899. He rose to the rank of colonel in 1916 and in the following year was appointed brigadier-general. He had charge of the training of troops in Illinois and commanded the 167th Brigade in France, in 1918. In the following year he was commander of Camp Logan, Houston, Texas, and in 1920-21 commanded the 10th Infantry at Camp Sherman. From the latter date he was adjutant-general at Governor's Island, at New York Har-

bor. His career included service in the Philippines, Panama Canal Zone, and as a member of the faculty of the United States Military Academy.

DEWAR, SIR JAMES (1842-1923). A British chemist (see VOL. VI). In 1915, he published (with G. D. Liveing) *Collected Papers on Spectroscopy*. The Copley medal of the Royal Society of London was awarded to him in 1916, and the Franklin medal of the Franklin Institute of Philadelphia in 1919.

DE WET, CHRISTIAN RUDOLPH (1854-). A South African military leader and statesman (see VOL. VI). He was one of the leaders in the rebellion in the South African Union which broke out in 1914. He was defeated at Mushroom Valley by General Botha on Nov. 12, 1914, taken prisoner by Colonel Brits on December 1, and sentenced to a term of six years and to pay a fine of £2000. He was released after one year's imprisonment, however, giving a written promise to take no further part in politics.

DEWEY, EVELYN (1889-). An American educational psychologist, and daughter of John Dewey. She was educated at Barnard College. She is the author of *Schools of Tomorrow* (1915), *New Schools for Old* (1919), and *Methods and Results of Testing School Children* (1920). In 1920, she became the director of the Psychological Survey of New York City.

DEWEY, HARRY PINNEO (1861-). An American clergyman, born at Toulon, Ill., and educated at Williams College and Andover Theological Seminary. He was ordained in the Congregational ministry in 1887, and from that year until 1907 served as pastor in various churches. In 1907, he became pastor of Plymouth Church, Minneapolis. He was trustee of a number of colleges and universities, among them Williams College, Andover Theological Seminary, and Straight University. From 1904 to 1907, he was director of the Brooklyn Heights Seminary, the Long Island Historical Society and the Eye and Ear Hospital. He held at various times offices in a number of religious bodies; for example, he became vice-president of the Congregational Education Society in 1907, and of the American Missionary Association in 1914. He was a member of the National Service Committee of Congregational Churches 1917-19, and in 1921 became a member of the National Council Commission on Missions. In 1914, he was made director of the Northeast Neighborhood Settlement House in Minneapolis, and in 1918 of the Pillsbury Settlement House in the same city.

DEWEY, JOHN (1859-). An American philosopher and educator (see VOL. VI). With the death of William James in 1910, Professor Dewey became the leader of the pragmatic school in the United States, and under his direction the emphasis of pragmatism was changed from that of religion and the will to believe to the practical problems of social reconstruction. After the War he went on an educational mission to China and Japan. While in Tokio he delivered a series of lectures subsequently published under the title of *Reconstruction in Philosophy* (1920). In 1924 Professor Dewey went on an educational visit to Constantinople. A frequent contributor to the *New Republic*, Professor Dewey did not attempt to draw much of a distinction between

the immediate exigencies of social action and the more cultural aspects of philosophic inquiry. Both in his *Reconstruction* and in his *Human Nature and Conduct* (1922) we meet with the notion that contemplative ideas (including the mystical belief in a transcendent Deity) are luxuries too great to be indulged in by the modern man because they tend to inhibit his impulses for action. The latter work, moreover, contains a remarkable discussion of the problems of social psychology, with particular emphasis on the much abused topic of instincts. For reasons of social optimism, Professor Dewey rejects the realistic conception of preëxistent determinisms fatally controlling the course of human action; instead he regards both instincts and habits as existing only from the moment they come into play but with a retroactive power of explanation. Such a solution opens up vistas of critical idealism, perhaps beyond the intentions of the pragmatic philosophy. Professor Dewey's other works after 1914 include: *German Philosophy and Politics* (1915); *Essays in Experimental Logic* (1916); *Democracy and Education* (1916); and *Creative Intelligence* (with others, 1917).

DEWING, THOMAS WILMER (1851-). An American figure and portrait painter (see VOL. VI). At the death of Charles L. Freer, in 1919, the Freer collection of Dewing's paintings passed to the National Gallery at Washington, where a room in the Freer Gallery was given over to these works—oil paintings, pastels, silver points and screens. A lyric vision, and the exquisite texture of his painting, evoke about his figures an air of charm and tenderness and mystery.

DEXTRIN. See CHEMISTRY, ORGANIC.

DIABETES. The decade 1914-24 witnessed the introduction of two radical departures in the treatment of diabetes, so that it is hardly too much to state that the disease as a social malady has been conquered. The innovations are respectively the Allen fasting treatment and the discovery at the University of Toronto of the organic preparation insulin, manufactured from the animal pancreas. In contrasting these new resources it may be stated that the Allen fasting treatment is both curative and able to arrest the progress of the disease when the pancreas remains able to function. Under favorable circumstances it is computed that all but about 8 per cent of the patients treated are benefited. The treatment itself is naturally a hardship, as the patient must remain in bed for some weeks, and it cannot be well carried out save in special institutions and under expert care. The field of the insulin treatment is somewhat different. The patient is in an advanced stage of the malady and menaced with death by diabetic acidosis. The injected pancreatic substance makes up for the deficiency of pancreas substance in the body, and so the patient may be kept alive indefinitely as long as he can receive these injections; he may even resume some of his former usefulness. He is not so restricted in his diet as the ordinary diabetic. As in the case of the fasting treatment, the insulin treatment is to be given only by those who are specially instructed, as there is no little danger to the patient from the unskilled use of the remedy. See FOOD AND NUTRITION.

DIAGHILEV, SERGEI. See BALLEET.

DIAMONDS. The diamond trade of the world by 1924 had come largely into the hands of a single large syndicate, including the De Beers Company and other mines, which was able to control the prices and production of the entire world. In 1922 in the course of its 33 years the De Beers Company reported that it had paid out in dividends $11\frac{1}{2}$ times the par value of its capital stock, or \$254,320,163 on a capital stock of \$21,899,260. In this period the total weight of the diamonds produced would have amounted to 27,816 pounds or nearly 14 tons. As in other industries the mining and cutting of diamonds was seriously interfered with during the period of hostilities and during the post-War period there resulted a number of interesting developments. Stones from Russia came upon the market at forced sale, but the London Diamond Syndicate traders made no effort to compete with such supplies. There was established, however, a Berlin jewel exchange where the jewels of Europe were traded in quite largely, and effort was made to control and stabilize the traffic in this way.

The diamond industry in France had declined during and after the War, and while in a large measure controlled in London, nevertheless Amsterdam and Antwerp continued as the leading markets for the cutting of gems. This was demonstrated by the fact that in 1923 diamonds cut but not set aggregating 539,972 karats, valued at \$52,020,098, were imported into the United States, of which amount 313,895 karats, valued at \$29,017,358 came from Belgium; 202,101 karats, valued at \$20,518,443 from the Netherlands; 10,000 karats, valued at \$976,543 from the United Kingdom and 9242 karats, valued at \$1,100,225 from France.

The greater part of the diamonds imported into the United States are cut, principally in Antwerp and Amsterdam. The rough uncut diamonds in 1923 imported into the United States aggregated 200,222 karats with a value of \$7,401,698, coming principally from Brazil and British Guiana. Brazil supplies the United States with the diamonds required for industrial uses.

The Diamond Syndicate in 1923 had control of the principal diamond producing regions of the world, not only the South African product, but also having a working agreement to handle those produced in the Congo and Angola.

The diamond mines of Angola, Portuguese West Africa, showed a remarkable development in 1916 over the time when prospecting began. These mines are in the Lunda district in the northeast corner of the Colony, just south of the Kasai diamond fields of the Belgian Congo. Prospecting began in 1916 in which year 809.30 karats of diamonds were found, and by 1921 the output had reached 106,719.46 karats. The production of diamonds in South Africa held its own during the 10 years from 1914 to 1924, and the production as given in the *Mineral Industry* is indicated on next page.

The Belgian Congo in 1915 produced 48,995 karats which amount by 1919 had increased to 275,000 karats, and in 1922 amounted to approximately 250,000 karats. Here the chief source of diamonds is the Kasai Basin which is operated by the Société Internationale Forestière et Minière du Congo (or Forminière) and its associated companies. As there was an improved market for diamonds in 1923 this organization was able to produce about 250,000 kar-

PRODUCTION OF DIAMONDS IN SOUTH AFRICA

Year	Production from mines		Alluvial diamonds	
	Karats	Value per karat	Karats	Value per karat
1913 . . .	4,944 946	41s 6d	206 049	108s 9d
1914 . . .	2 653,089	37 0	143 924	80 2
1915 . . .	2 131	36 6	97 678	80 4
1916 . . .	2,170 348	43 11	167,620	113 2
1917 . . .	2 710 041	49 2	182,992	113 10
1918 . . .	2,385,361	51 5	143 348	134 6
1919 . . .	2 366 744	75 9	209,589	261 6
1920 . . .	2,312 486	106 3	221,460	220 6
1921 . . .	671 483	68 16	151 552	118 1

ats, compared with 190 000 karats in 1922, in addition to Beceka Company producing between 100,000 and 150,000 karats, the Kasai Mining Company about 30,000 and the Luebo about 13,000 karats. The Diamang Company produced over 100,000 karats. This made the 1923 production of the Kasai Basin about 525,000 karats, compared with 348,000 karats in 1922.

While there were several diamond mines in Arkansas, working in connection with the peridotite, there had been no substantial developments in the industry, although a number of stones had been found ranging from almost microscopic size up to 20 $\frac{1}{4}$ karats.

DIAMONDS, ARTIFICIAL. See MINERALOGY.

DIAZ, ARMANDO, BARON (1861-). An Italian soldier. He was educated at the military college of Turin and served in the Libyan War. He commanded a division on the Carso front after the entrance of Italy in the War, and was promoted commander of the 23d Army Corps which penetrated the Selo line on the Middle Carso in August, 1917. After the disaster of the Caporetto, when the German and Austrian troops penetrated the Italian line and forced it to retreat from the Isonzo to the Piave rivers, Diaz was appointed commander-in-chief to succeed General Cadorna. He made a brilliant defense and established his reputation as one of the greatest generals of the War. By the end of June, 1918, he had forced back the enemy east of the Piave, and on October 27, he attacked across the Piave, and was successful all along the line. A week later Austria surrendered. He was made minister of war in the Mussolini Cabinet, in 1922.

DIBELIUS, MARTIN (1883-). A German theologian and historian born at Dresden. He specialized on the literature and history of primitive Christianity and other religions. He studied at the universities of Neuchatel, Leipzig, Tübingen and Berlin and was professor of theology in Berlin from 1910 to 1915, later becoming professor of New Testament theology at Heidelberg. His principal works are: *Die Lade Jahwes* (1906); *Die Geisterwelt im Glauben des Paulus* (1909); *Urchristliche Ueberlieferung von Johannes dem Täufer* (1911); *Isisweihe bei Apulejus* (1917); *Formgeschichte der Evangelien* (1919); *Kommentar zum Jakobusbriefe* (1921).

DIBELIUS, WILHELM (1876-). A German philologist who specializes on English language and literature, born in Berlin. He successively held professorships in Posen, Hamburg, and other cities before retiring to Godesberg on the Rhine. His principal works are *John Coggrave und die englische Schifffsprache* (1899), *Englische Romankunst* (1910), and an exhaustive study of *Charles Dickens* (1916).

DICKINSON, ASA DON (1876-). An American librarian and editor, born at Detroit, Mich. He studied at the Columbia University Law School and the State Library School at Albany, N. Y. In the period 1903-12, he was successively connected with the Brooklyn Public Library, Union College Library (Schenectady, N. Y.), Washington State College Library, and others. In 1912-15 and 1916-18, he was on the editorial staff of Doubleday, Page and Company, and later in the war service department of the American Library Association at Hoboken, N. J., and Paris, France (1918-19). His work organizing the Punjab libraries for the Indian government was followed up by the publication of *Punjab Library Primer*, in 1917. Mr Dickinson also published *Europe at War* (1914), *The Kaiser* (1914), and several children's publications along a patriotic vein.

DICKINSON, HOBART CUTLER (1875-). An American physicist, born at Bangor, Me. He was educated at Williams College and later gained the Ph.D. degree at Clark University. During 1900-01 he was an assistant at Williams, but in 1903, entered the service of the United States Bureau of Standards, where in 1916 he became chief of the division of heat and power. His original studies have included papers on thermometry, calorimetry, specific heats of liquids, heats of combustion and fusion, thermal properties of refrigerants, thermal conductivities, and internal combustion engines.

DICKINSON, THOMAS HERBERT (1877-). An American writer, born at Randolph, Charlotte County, Va. He studied at Ohio State University, Columbia University, and the University of Wisconsin. During the War he was a member of the United States Food Administration (1917-18), and the American Relief Administration, Paris and New York (1919-22). He edited *The Play-Book* (1913-15), and several books on the drama. In addition to articles in magazines, he has published *The Case of American Drama* (1915), *Contemporary Drama of England* (1917), and *The Insurgent Theatre* (1917).

DICKINSON COLLEGE. An institution at Carlisle, Pa., founded in 1783. The number of students enrolled in the college increased from 292 in 1914 to 523 in 1924, the number of teaching members of the faculty from 16 to 27, and the number of volumes in the library from 30,000 to 33,000. The productive funds increased from \$245,000 to \$550,000 and the total income from \$43,050 to \$147,500. There was also a law school connected with the college which increased in membership from 119 to 218 and in the size of its faculty from 7 to 10 members. President, J. H. Morgan.

DICKSON, LEONARD EUGENE (1874-). An American mathematician (see VOL. VI). Among his later writings are: *Algebraic Invariants* (1915); *Finite Groups* (1916); *History of the Theory of Numbers* (1919; vol ii, 1920); *Trigonometry with Practical Applications* (1921); *First Course in the Theory of Equations* (1921).

DIESCH-KAULFUSS, CARL H. (1880-). A German librarian, born in Sorau. He studied at the universities of Tübingen and Leipzig and was especially interested in modern literature, the history of the stage and the Reformation. He is librarian of the state library of Berlin. Among his principal works are: *Buch*

der Reformation (1917), and *Deutsche Dichtung im Strome des Lebens* (1921).

DIET. Within the decade 1914-24 the discovery of the vitamins and other advances added greatly to knowledge of dietetics. Some enthusiast stated that nearly all ills of the body might be produced and cured by diet. If we include in the term everything introduced into the stomach, the statement is approximately correct. It is no longer possible to distinguish between food and drugs, for the end products of protein digestion are closely related chemically to certain active drugs. Some of the amino-acids are known to be stimulants of growth; they agree to this extent with growth-vitamins. The hormones at times present in the diet are of the same nature as those manufactured in the body itself and have the status of drugs. Some of the amino-acids formed in protein digestion are of no nutritive value when given alone. Gelatine has no food value as a substitute for the albumins, but it may be utilized in certain combinations.

While autointoxication is still imperfectly understood, we know that the action of intestinal bacteria on food can give rise to certain poisonous products, and we can surmise that the behavior known as conjugation, in which the split products of digestion may lose their poisonous properties by uniting with one another, may sometimes fail to take place. Surgeons attribute many ills to intestinal stagnation from purely mechanical causes, and it is true that a short fast is of material benefit in many illnesses; the improvement which follows the use of a light or monotonous diet is still more apparent. If it is kept up too long, a diet poor in calories, vitamins, protein, mineral matter, etc., will lead to the development of numerous diseases. A disease may sometimes be controlled by diametrically opposite plans of diet; everything depends on the individual case. Typhoid fever, often the result of impure and germ-infested drinking water, has often been beneficially treated by semistarvation; at the other extreme, supposing of course that the digestive processes have not been greatly impaired, equally good results have resulted from stuffing the patient with highly concentrated food. The latter course counteracts the great tendency to lose weight. The dietetic treatment of diabetes (q.v.) was revolutionized, and the application of the Allen fasting treatment has justly been regarded as a great triumph in therapeutics. In this resource the short fast has been followed by the use of a very light diet slowly increased in nutritive value. The introduction of insulin into the therapeutics of diabetes made possible the use of a more liberal diet.

Acidosis, a form of autointoxication which is not to be confused with intestinal self-poisoning, was shown to play an extraordinary part in the causation of disease. The readiness with which it can now be controlled by diet is one of the greatest recent advances in medicine. The condition develops in actual starvation and in diabetes, in which the carbon of the diet is imperfectly utilized; it may also follow dietetic errors of excess. Acidosis, with its lowering of the normal alkaline reserves of the body, follows on a diet consisting largely of so-called

acid forming foods, some of which have always been regarded as staples. The use of a diet in which alkali formers predominate and even the addition of alkalies to ordinary diet often leads to great improvement.

The beneficial results of the so-called basic diet, from which acid formers are largely omitted, are seen especially in the middle-aged and elderly, and such chronic conditions as high blood pressure and affections usually ascribed to excess of uric acid or slowing up of nutrition with accumulation of waste products in the body, respond remarkably well. In any case of chronic disease or ill health of obscure origin in which there is reason to suspect the presence of diminished alkaline reserves, the basic diet, which entails no trouble or discomfort, may forestall expensive cures at distant resorts and surgical intervention for the supposed results of focal infection. See FOOD AND NUTRITION. VITAMINE OR VITAMINES.

DIETRICH, JOHN HASSLER (1878-). An American clergyman, born at Chambersburg, Pa., and educated at Franklin and Marshall College and at the Reformed Theological Seminary at Lancaster, Pa. He was ordained in the ministry of the Reformed Church in 1905, but before this he held various positions such as private secretary and manager of *Life's Fresh Air Fund*. From 1905 to 1916, he held various pastorates, becoming in the latter year pastor of the First Unitarian Society in Minneapolis. He is the author of: *The Gains for Religion in Modern Thought* (1908); *The Religion of a Sceptic* (1911); *Substitutes for the Old Beliefs* (1914); *From Stardust to Soul* (1916); *The Religion of Evolution* (1917); *The Religion of Humanity* (1919).

DIFFENDORFER, RALPH EUGENE (1879-). An American clergyman, born at Hayesville, Ohio, and educated at Ohio Wesleyan University, Drew Theological Seminary and Union Theological Seminary. He was assistant secretary of the Epworth League from 1902 to 1904, and from 1904 to 1916 was secretary of the Missionary Education Movement in the United States and Canada. The following year (1916-17), he was educational secretary of the Board of Home Missions and Church Extension and of the Board of Foreign Missions of the Methodist Episcopal Church. He was associate secretary of the Centenary Commission of the Board of Home Missions and Church Extension in 1918, and in 1919-20 served as director of the Home Missions Survey of the Inter-church world movement. In 1920, he was appointed secretary of the department of education of the Committee on Conservation and Advance of the Methodist Episcopal Church in Chicago. He is the author of: *Child Life in Mission Lands* (1904); *Junior Studies in the Life of Christ* (1904); *A Modern Disciple of Jesus Christ—David Livingstone* (1913); *Thy Kingdom Come* (1914); *Missionary Education in Home and School* (1917); *The Church and the Community* (1920).

DIFFUSION OF GASES. See CHEMISTRY

DILLON, JOHN (1851-). An Irish politician and agitator (see VOL. VII). In 1918, he succeeded Mr. Redmond as head of the Irish Nationalist party and was very bitter in denouncing England's methods in coercing the Irish. During the War he was among those who favored Ireland's share in the conflict, although he was opposed to compulsory service

and the Munitions Department, and was not kindly disposed toward Lloyd George's suggestions for settling the Irish question.

DILNOT, FRANK (1875-). An English author and journalist, born in Hampshire. He was educated privately and began as a newspaper reporter in 1900 on the staff of the *Central News*, London, which he left two years later for the *Daily Mail* (1902-10). He was editor of the *Daily Citizen*, a British labor organ (1912-15), and thereafter was a correspondent for the *Chronicle* to investigate social and economic conditions in England. In 1916-19, he was president of the Association of Foreign Correspondents in America, and in the latter year, editor of the *Globe*. His publications, the majority of which give evidence of thorough insight into social and economic conditions in England, include: *The Old Order Changeth: the Passing of Power from the House of Lords* (1911), *Lloyd George the Man* (1917), *The New America* (1919), and *England after the War* (1920). His *Lloyd George the Man* had a second edition with three supplementary chapters in 1923 under the title *Lloyd George*. The indiscriminating admiration of the first edition has distinctly ebbed in the supplementary chapters.

DINGLER, HUGO ALBERT EMMANUEL HERMANN (1881-). A German mathematician and physicist, born in Munich and educated at the high school of Aschaffenburg and at the universities of Erlangen, Göttingen and Munich. He became a member of the faculty of the University of Munich in 1912. His works include: *The Foundations for a Critique of the Exact Sciences* (1907); *The Boundaries and Aims of Science* (1910); *The Bases of Natural Philosophy* (1913); *The Elements of Physics* (1920); *Remarks on the Theory of Relativity* (1921).

DINSMORE, CHARLES ALLEN (1860-). An American clergyman and Dante scholar (see VOL. VII). In 1920, Dr. Dinsmore gave up his pastorate at Waterbury, Conn., and became professor of spiritual interpretation of literature at the Yale Divinity School. In 1920, he was Carew lecturer at the Harvard Theological Seminary. His *Life of Dante* was published in 1919.

DINWIDDIE, ALBERT BLEDSOE (1871-). An American university president, born at Lexington, Ky., and educated at the University of Virginia and the University of Göttingen, Germany. He began his career with a teaching licentiate in the University of Virginia, in 1888, and held various teaching positions, principally in secondary schools, until 1896, when he was appointed professor of mathematics in Southwestern Presbyterian University. In 1906, he was called to Tulane University as assistant professor of applied mathematics and astronomy. He was made associate professor in 1908 and full professor in 1910. He was dean of the College of Arts and Sciences, director of the summer school from 1910 to 1918, and in 1918 became president. He was also elected president of the American Association of University Professors, the Louisiana Council of Education, and other educational associations.

DINWIDDIE, EDWIN COURTLAND (1867-). An American temperance advocate (see VOL. VII). He directed the national campaign for the Constitutional Amendment for the prohibition of the liquor traffic in 1917,

and was president of the International Congress against Alcoholism in 1920-21.

DIPHTHERIA. The greatest advance since 1914 in knowledge of this plague is contained in the application of the Schick test to school children, to determine the relative susceptibility or immunity to infection. Many facts have come to light which contradict popular belief. Diphtheria has commonly been regarded as a disease of the tenement population, while scarlet fever was believed to attack both social extremes indifferently. The Schick test shows plainly that the prosperous enjoy no immunity from diphtheria and that the susceptibility to the infection among the well-to-do is about three times as great as among the indigent. This is offset by the recognition among the prosperous of the importance of segregation. The Schick test has also shown that heredity is a factor.

In any case susceptibility and immunity are not lasting, and tests have to be repeated at comparatively short intervals. Susceptibility is apt to disappear after the age of two or three years. The Negro child is much more susceptible to the disease than some of the whites, e.g. the Italians. Immunization tests are successful in a proportion varying from 70 to 93 per cent. Reports of results of the application of the Schick test vary much with the locality. Diphtheria was responsible for 20,000 deaths annually in the United States. Susceptibility exists in 85 per cent of all children tested.

DISCIPLES OF CHRIST. The fifth largest Protestant communion in the United States, congregational in organization. It was first in percentage of growth in 1923, reporting 4.2 per cent. It seeks to restore the union of the churches through a return to the plan outlined in the New Testament without human addition of creeds and formulas. The number of communicants increased from 1,362,711 in 1914 to 1,383,247 in 1923; the number of churches from 9076 to 9533; the number of ministers from 5592 to 6150; and the number of pupils enrolled in the Sunday schools from 900,000 to 1,170,148. In addition to varied types of home mission work among Negroes, Indians, Orientals, Mexican-Americans, and immigrants, foreign missions were maintained throughout the decade in Africa, China, India, Jamaica, Japan, Mexico, the Philippines, Porto Rico, South America (Argentina and Paraguay), and Tibet. The communion maintained 25 colleges in the United States, coöperating through a board of education. The Men and Millions Movement was started in 1913 to secure \$6,300,000 to equip mission stations and increase the endowment of the educational and benevolent institutions of the communion, to enlist 1000 workers for the mission field, and to start "every member" canvasses as the best plan for securing regular offerings for missions. The Movement was completed in 1918. In 1920 the six missionary boards of the communion united under the title of the United Christian Missionary

Society. with headquarters at St. Louis, Mo.

DISEASES OF PLANTS. See PLANTS, DISEASES OF.

DITTRICHSTEIN, LEO (1867-). An actor-playwright, born in Temesvar, Austria-Hungary. He was educated in Vienna and was naturalized as an American citizen in 1897. He made his New York debut in *Die Ehre*, 1890. This was followed by: *Mr. Wilkinson's Widows*, *Trilby*, *Are You a Mason?* and other plays. He is the author of numerous plays, among which are: *Gossip* (with Clyde Fitch, 1895); *A Southern Romance* (1897); *The Last Appeal* (1901); *What's the Matter with Susan?* (1904); *The Ambitious Mrs. Susan* (1907); *The Million* (from the French, 1911); *The Concert* (1911); *Temperamental Journey* (1912); *The Great Lover* (1915).

DIVING SHELL. See PROJECTILE.

DIVISION. See ARMIES AND ARMY ORGANIZATION.

DIVORCE. Whether because of some general demoralization or because of an awakening sense of what marriage ought to be, the striking increase in divorcement during these years was not peculiar to any one country. In England, notwithstanding the narrow restriction of grounds and the prohibitive cost, the number of absolute divorces rose from 546 in 1906 to 972 in 1916, and to 1629 in 1919, while the number of petitions for divorce, even more significant of the general trend, rose from 767 to 1163 and to 5085. In Germany the increase in the number of divorces from 1918 to 1920 was from 13,344 to 36,542; in Switzerland, from 1699 to 2241. In Sweden the number rose from 1098 in 1918 to 1455 in 1922. Norway seemed to be the one exception to the rule, the number of divorces in 1922 falling slightly below the figure for 1918, 594. In France the ratio of divorces to marriages had become about 1 to 5: 7851 divorces in 1918-19, 11,514 in 1919-20. Japan was still conceded first place among the nations with a high divorce rate. As for the United States, the number of decrees rose from 72,062 for 1906 to 112,036 for 1916, from a ratio of 84 per 100,000 population to 112. This ratio rose by 1922, according to the Department of Commerce, to 136; while the number of marriages per 100,000 population fell from 1055 in 1916 to 1033 in 1922. In 1916, desertion and cruelty accounted for 65.1 per cent of all divorces granted. In 1922 there was one divorce to every 7.6 marriages.

United States. That phase of the divorce problem which received particular attention in the United States during the decade 1914-24 was the need for uniformity of legislation. The various States, left to their own resources, had developed a confusing diversity of divorce legislation. In South Carolina, divorce was not allowed; in New Hampshire there were 14 recognized grounds for a decree. Counting certain duplications, there were in the United States 363 causes for divorce: in one State, New York, unfaithfulness alone; in others, for varied reasons down to mere bad temper. And the legal complications ensuing on the remarriage of divorced persons were correspondingly abundant and confusing: a marriage legal in one State was bigamy in others, and a child legitimate in one State was illegitimate in another. Recognition of the need for some measure of uniformity in the divorce laws of the United States grew steadily. In 1913 at a con-

ference of governors the movement to secure uniform divorce legislation was endorsed; and throughout the decade by many organizations in convention. But the question of State's rights impeded action. In 1924, however, there was introduced in the Senate, a Federal bill calling for uniform regulation of marriage and divorce. In this, five causes for absolute divorce were fixed: Adultery, cruel and inhuman treatment, abandonment or failure to provide, incurable insanity, and conviction for infamous crime. The measure was referred to committee to await action at the next session of Congress.

Other Countries. The tendency abroad during the period was markedly toward liberalization of divorce provisions. Spain and Italy (both predominantly Catholic countries), where divorce was not allowed, were in striking contrast. In England, the report of the Royal Divorce Commission, presented in 1912, had recommended an increase of both the causes of divorce and facilities for divorcement. Although this was steadily opposed by the Church of England, and several bills on the subject were defeated during the period, in 1923 a measure was got through by which the terms for a decree, infidelity, were at least made identical for men and women (previously, for women, cruelty or desertion as well as infidelity had been necessary). The prohibitive cost of divorce in England had been somewhat eased by a Poor Persons' Act, under which, if an individual did not object to be so classed, a decree might be obtained at a cheaper rate; but up to 1924 only one divorce court (in London) had been established and this condition added greatly to the expense of securing a decree. On the continent there was an unmistakable drift toward the adoption of mutual desire as a reason for the dissolution of marriage. In Austria and Russia this had been legal for Jews; in Holland, the principle was evident in a provision for divorce after five years of judicial separation; Belgium recognized as grounds "mutual and unwavering consent"; and in Portugal and Rumania mutual consent was accepted, subject to provisions. The new German, Austrian, and Russian legislation on the subject, in adopting mutual consent as a cause, endeavored specifically to provide against an irresponsible attitude toward children or wife. The Scandinavian experiment was most noteworthy. As a result of a comprehensive study of Scandinavian social legislation, 1910-18, divorce legislation was adopted in Sweden in 1915, in Norway in 1918, and in Denmark in 1922, which definitely recognized mutual consent as the fundamental reason for the dissolution of marriage. Separation for a year, however, was required before the granting of the decree. Both parents were required to contribute to the support of children. The question of custody was left to be settled by the parents where possible and where there was involved no danger to the welfare of the child. For cases where divorce was desired by only one party, the grounds were liberal, including such as flagrant neglect, misuse of intoxicants, etc. The statistics previously given show that there was no increase from 1918 to 1922 in Norway under the new legislation, and in Sweden no greater than in other countries. The expedient adopted in Latvia, Lithuania, Czecho-Slovakia, and Jugo-Slavia, to stem the

increase in divorce, was to make it more difficult to marry and to grant dissolution of marriage for the asking; but that this was no solution seemed evident from the marked increase in the number of divorces in France under similar laws.

DIX, KURT WALTER (1878-). A German pedagogue and writer on subjects of education, born in Greiz. He studied at the universities of Dresden and Jena and has devoted himself to teaching and studying child psychology, child hygiene, etc. Among his works are: *Erziehung und Nervosität im Kindesalter* (1909); *Körperliche und geistige Entwicklung eines Kindes* (1911-12); *Kindeskunde* (1911); *Entwicklung der Denkkäfte* (1921).

DIXON, AMZI CLARENCE (1854-). An American clergyman and author (see VOL. VII). His later works include: *Reconstruction* (1919); *The Birth of Christ, the Incarnation of God* (1919); *Why I Am a Christian* (1921); *Higher Critic Myths and Moths* (1921).

DIXON, JAMES MAIN (1856-). An American teacher and author (see VOL. VII). In 1920, he wrote, *The Spiritual Meaning of Tennyson's "In Memoriam,"* and *Manual of Modern Scots*.

DIXON, ROLAND BURRAGE (1875-). An American anthropologist (see VOL. VII). He was professor at Harvard after 1916 and member of the American Commission to Negotiate Peace (1916-18) in Paris. He is a contributor to anthropological and ethnological journals and his most recent works include *Oceanic Mythology* (Myths of the Idonesian, Oceanian, Australian region, published in 1915), and *The Racial History of Man* (1923).

DIXON, ROYAL (1885-). An American author, born at Huntsville, Tex., and educated at the Sam Houston Normal Institute and as a special student at the University of Chicago. After spending five years with the department of botany at the Field Museum of Chicago, he entered the literary field as a member of the *Houston Chronicle* staff. He has been a special contributor to the leading newspapers of New York, where he has lectured for the Board of Education. His interest and attention have been directed to immigration, as a director of publicity of the Commission of Immigrants in America, and as managing editor of *The Immigrants in America Review*. His works include: *The Human Side of Plants* (1914); *Americanization* (1916); *The Human Side of Animals* (1918); *Hidden Children* (1922).

DIXON, THOMAS (1864-). An American novelist and playwright (see VOL. VII). His photoplay, *The Birth of a Nation*, appeared in 1915, and he published *Fall of a Nation* (1916), *The Way of a Man* (1918), *A Man of the People* (1920), and *The Man in Gray* (1921).

DJEMAL PASHA (AHMAD DJEMAL) (1875-). A Turkish soldier and politician, born at Bagdad. After an excellent French education, he entered the Turkish army, and soon became lieutenant-colonel. He acquainted himself with the Young Turkish Movement and was criticized for his obvious support. In 1911, after serving at Adana in Cilicia, he was made governor of his native town of Bagdad, and shortly after became Vali of Constantinople. About this time he resigned as commander of the 1st Corps at Constantinople, and devoted himself to politics, becoming Minister of Public

Works and shortly afterwards Minister of Marine. These political activities brought upon him the personal antagonism of Enver Pasha. Djemal was opposed to any combination that included both Turkey and Germany; he became distinctly pro-French at the outbreak of the War. Thus it was because of his political beliefs and influence that Enver Pasha sent him to Syria as commander-in-chief of the 4th Army. Upon being recalled in 1917, he was made commander-in-chief of all the troops except those at the Sinai front, an exception which immediately led to friction; as a result, Djemal, losing interest, abandoned military operations. In 1917, he returned to Constantinople and resumed his duties as Minister of Marine, but opportunities for military and political power did not come his way, and on the downfall of Turkey in 1918, he fled to Germany and thence to Switzerland. Three years later he became military adviser to the amir of Afghanistan.

DOBRUDJA. See BULGARIA; RUMANIA.

DOCKS. The construction of large merchant steamers and vessels of war in the period between 1914 and 1924 developed the need for drydocks or, as they are sometimes called, graving docks, of increased size and capacity. Under normal circumstances there would have been no such need but with the outbreak of the War in 1914 the necessity for such facilities was appreciated, particularly in the United States. Before the United States entered the War there was naturally an increase in its commerce, and at the same time the officers of the United States Navy appreciated that the construction of suitable drydocks was an essential element in any scheme of naval preparedness. Accordingly as early as 1914 plans were discussed for additional drydocks located at various naval stations, while at the Panama Canal, and at certain leading ports, docks were constructed intended primarily for merchant shipping. When the United States actively joined the Allies in the War and took over for its transport service the former German liner, the *Vaterland*, renamed *Leviathan*, it was apparent that no drydock in the United States was large enough for that vessel.

Pearl Harbor Drydock. As early as 1908 the United States Navy began the construction of a drydock at Pearl Harbor, Hawaiian Islands, which was completed and flooded on Aug. 21, 1919. The plans for developing a small naval station located at this point involved the construction of a graving dock 589 feet long, but with the completion of the Panama Canal and the increased size of ships navigating the Pacific Ocean it was determined to increase its dimensions. Accordingly the dock was built 1022 feet long, 138 feet wide at the coping and 30½ feet in effective depth, there being 43½ feet depth from top of coping to floor. This gave a clear water basin 1010 feet long and 1010 feet wide at the bottom clearance. In 1913 a seismic disturbance caused the collapse of the work under way, and after a technical investigation a modified plan of construction was adopted in 1915, and finished in 1919. A full report of this drydock, the history of its early construction, as well as the adoption of the new design is contained in the *Transaction of the American Society of Civil Engineers*, vol. lxx, page 223, 1916.

Norfolk Navy Yard Drydock. The United States Navy Yard at Portsmouth, Virginia, had its facilities increased by the construction of a drydock 1011 feet long, 144 feet wide at the coping and 40 feet deep, which was opened in April, 1919, after having been under construction since February, 1917. This work involved the excavation of 625,000 cubic yards and the placing of a total yardage of concrete of 185,000. The Norfolk Navy Yard also contained two drydocks, built through the cooperation and financial assistance of the United States Shipping Board during the War, which were completed in 1919, and formally inaugurated on October 31, of that year, by the Queen of the Belgians.

Commonwealth Drydock. In 1915 active work was begun on a large drydock at South Boston built by the Commonwealth of Massachusetts which was an important element in the port and harbor development of Boston. This dock at the time of its completion was the largest in the United States, being 1176 feet long and 149 feet, 9 inches wide. It could take care of a ship of 1150 feet in length with a beam of 115 feet and 45 feet draft. It had a capacity of 55,000,000 gallons, and was unwatered by three electric pumps, requiring about two hours for the operation. This dock cost the Commonwealth of Massachusetts over \$3,000,000, and was purchased by the United States government under authority from Congress for \$4,100,000, being formally taken over by the United States Navy and put in commission on Dec. 22, 1919, the battleship *Virginia* being the first vessel to use the dock.

Balboa Drydock. In 1916 the new drydock at Balboa, at the Pacific terminal of the Panama Canal zone, was completed with a length of 1000 feet, a width of 110 feet and a depth of 35 feet over the blocks at mean tide. This structure was one of the important works connected with the shipping facilities of the Panama Canal, and made possible the docking and repair of steamers of considerable size.

St. John, N. B., Drydock. The St. John Drydock and Shipbuilding Company in November, 1923, opened its new drydock at St. John, N. B. This new dock was the largest of its kind in the world, having an extreme length of 1225 feet and length over the blocks of 1150 feet. It was so arranged that it could be used in two independent sections, one 650 feet long and the other 500 feet long. There was a patent slipway 720 feet in length and a cradle 240 feet long. The depth over the sill at high tide was 42 feet. The dock was provided with a 70-ton fixed crane and a 20-ton traveling crane.

Drydock at Quebec. The Champlain drydock at Quebec, which had been under construction since 1914, was completed in August, 1918. Situated on the south side of the St. Lawrence, and with a length of 1150 feet, a width of 120 feet and depth over the sill of 34 feet at neap tide, and 40 feet at high water at spring tide, it was at the time of its completion one of the largest drydocks in the world, being able to accommodate the largest ships for which the port of Quebec had adequate deep water berths. This dock was divided into two compartments with an inner chamber 650 feet in length and an outer one 500 feet in length, the latter being closed by a rolling caisson, while the middle entrance was formed by a floating caisson. For emptying the dock three main pumps of the horizontal centrifugal type, designed to deliver

63,000 gallons a minute against the total head of 25 feet, were provided. These were operated by electric power and could empty the dock in about two and a half hours.

Floating Docks. In the period between 1914 and 1924 there was also an increase in the size and capacity of floating docks which, it will be recalled, could be used at any convenient location, and could be moved from place to place if so desired. At the close of the War two large floating docks owned by Germany, and at the time the largest structures of the kind, passed into the possession of the British. Each of these had an overall length of about 700 feet and a lift of some 40,000 tons. The British Admiralty, however, decided that there was need of a still larger floating dock, and in November, 1922, one was put under construction with a length of 960 feet, and a lifting capacity of 60,000 tons. This was built at the Walker Shipyard of Sir W. G. Armstrong, Whitworth and Company, and was designed for the port of Southampton. This dock which, at the time of its completion, in 1924, was the world's largest floating dock, was of the double sided, self-docking sectional box type, and consisted of pontoon and two parallel walls divided transversely by seven sections. When in position at Southampton it was moored by four steel booms 110 feet long, hinged at one end to the dock and at the other extremity to four dolphins of reinforced concrete. When submerged the dock contains some 80,000 tons of water to pump out which 14 motor driven centrifugal pumps were provided and with all in operation some four hours were required to remove the water. The British Government accordingly had with the Southampton and the two German docks three floating docks, each of which was capable of taking a large battleship, such as the *Hood*, and a distinct strategic and maintenance advantage was gained by the fact that all of these docks could be passed through the Suez Canal. It was rumored in 1924 that one of these floating docks was to be sent to Singapore, another to Malta, but no confirmation was available of such disposition.

American Built Docks in France. At the mouth of the Loire River in France, during the War, engineers of the American Army constructed a notable timber dock system which provided new berths for 10 vessels in addition to an existing series of docks adjoining, previously constructed by the French. These docks were built of timber supported by wooden piles and were located on mud flats. On their shore side were built long low classification sheds, and further inland a receiving yard, a departure yard for the handling of freight cars. There was provided specially designed timber rigging for the handling of ships' cargoes, and heavy steel gantry cranes were erected also.

DODD, LEE WILSON (1879-). An American author and playwright, born at Franklin, Pa., and educated at Yale. He studied law at the New York Law School and was admitted to the bar in 1902, but gave up law five years later for literature, in which he made distinct accomplishment, but has been criticized as being over novelistic. He is author of *A Modern Alchemist* (1906); *The Return of Eve* (1909); *Speed* (1911); *The Middle Miles* (1915); *His Majesty Bunker Bean* (1915); *Pals First*; *The Book of Susan* (1920) and *Lilia Chenoworth* (1922).

DODD, WILLIAM EDWARD (1869-). An American historian, born at Clayton, N. C., and educated at Virginia Polytechnical Institute and the University of Leipzig. While successively holding the chairs of history at Randolph-Macon College (1900-08) and at the University of Chicago (1908-), he wrote: *Jeffersons Rückkehr zur Politik, 1796* (1900), *Life of Nathaniel Macon* (1903); *Life of Jefferson Davis* (1907); *Statesmen of the Old South* (1911); and *Woodrow Wilson and His Work* (1920). In addition, he was editor and joint author of the *Riverside History of the United States* (1915) and of *The Cotton Kingdom* (in *Chronicles of America* series), and co-translator of Lamprecht's *What Is History?* (1905).

DODECANESE. A group of 12 small islands, the Sporades, off the southwest coast of Asia Minor, among which, politically, Rhodes was included. Most of them, barren rocks, are uninhabited. Of their total population, 100,198 in 1917, the greater part were Greek sponge fishermen inhabiting Rhodes and Cos. During the Libyan War between Italy and Turkey, the Italians occupied the islands, and by the Treaty of Lausanne of 1912, Italy was permitted to continue occupation only as a guarantee toward Turkish evacuation of Tripoli. The Turks claimed to have fulfilled their obligations, but the Italians stayed on. After the War the question of the Dodecanese became a test of the sincerity of the Allies' idealistic pretensions. On the one hand was the plain fact of the Greek nationality of the population; on the other, the Italian claim, frankly imperialistic, based on actual possession and on the recognition of this possession in the secret Treaty of London in 1915, by which the Italian government had been induced to enter the War. In 1919 the Greek Premier, Venizelos, effected a bargain with Tittoni, Italian foreign minister, by which the Dodecanese were to be turned over to Greece and Rhodes to Italy. The disposition of the latter the Italians promised to submit to a plebiscite when Great Britain should promise to do similarly in the case of Cyprus. The Peace Treaty of Sèvres in 1920 transferred the islands from Turkish to Italian sovereignty, while a separate Greco-Italian treaty signed on the same day in accordance with the Venizelos-Tittoni agreement promised all except Rhodes, where a plebiscite was to be held, to Greece. Despite this pledge, Italy continued in occupation of the disputed territory, and shortly afterward repudiated the agreement, on the ground that the Sèvres Treaty had not been ratified. Events of the succeeding years once more brought the Dodecanese question before the attention of the world. The overthrow of Venizelos, the defeat of Greece in its Asia Minor adventure, and the rise of Italian chauvinism under Mussolini, gave substance to the belief that Venizelos' settlement was only too ephemeral and that Italy rather than Greece was to control the eastern Mediterranean. The soundness of these conjectures was confirmed when, regardless of self-determination and the principle of nationalism, and in a spirit typical of the old diplomacy, the Great Powers in 1923 confirmed Italy's hold on the islands. By article 15 of the Treaty of Lausanne, Turkey renounced all rights over the Dodecanese, Rhodes, and the island of Castellorizzo in favor of Italy. No mention was made of a plebiscite. See GREECE; ITALY.

DODGE, RAYMOND (1871-). An American experimental psychologist. He was educated at Williams College and the University of Halle (Germany). In 1896, he was appointed professor of philosophy at Ursinus College, and the following year became associated with Wesleyan University, and was made full professor in 1902. He was selected to conduct experiments on the psychology of nutrition at the Carnegie Institute laboratory (1913-14), and became the editor of the *Journal of Experimental Psychology* (1916) and of the *Journal of Comparative Psychology* (1921). He is the author of numerous scientific monographs and papers on the psychology of language, vision, eye movement, and dynamic psychology in general.

DODGE, WILLIAM DE LEFTWICH (1867-). An American artist born at Liberty, Va., who studied in Paris and Munich and entered first place in the examination for the Ecole des Beaux Arts. Mr. Dodge's work as a mural painter is represented in New York by his decorations of the Empire Theatre, of the Waldorf-Astoria Hotel, and of other theatres and hotels. Among his principal works were the decorations of the Café de l'Opéra, Paris, The Folies Bergères Theatre, murals for the Panama-Pacific International Exposition, and for the Flag Room at the capitol at Albany, mosaics for the Hall of Records, New York, "Signing of the Peace," at Versailles, and "Taking of the Fort de Vaux."

DOFLEIN, FRANZ J. T. (1873-). A German zoölogist born in Paris. He traveled extensively in the United States, West Indies and Mexico. He succeeded Weismann as professor of zoölogy at the University of Munich, in 1912, and became professor at Breslau in 1918. Professor Doflein's published works were on the protozoa, animal biology, and psychology.

DOHENY, EDWARD LAURENCE (1856-). An American capitalist and oil producer, born at Fond du Lac, Wis., who spent his early years prospecting for gold with varying success. Stranded in Los Angeles in 1892, he noticed a wagonload of pitch passing along the street and investigated the hole from which it was taken. He obtained a lease of a lot near-by, and at 225 feet struck a gusher which started the Los Angeles oil field. After finding several other fields, and gaining several fortunes, he went to Mexico in 1900 and organized the Mexican Petroleum Company with \$10,000,000 capital, and obtained leases on about 1,000,000 acres of barren land near Tampico. In four or five years, Tampico was a world oil centre. The control of such vast enterprises inevitably led Doheny into political activity. In Mexico, he was charged with being responsible for several revolutions, and he was a large factor in California politics. He was prominent in the transactions in regard to the United States naval oil reserves, and was called to Washington to testify before the investigating committee early in 1924. His testimony revealed that he had lent to former Secretary of the Interior Albert B. Fall \$100,000, and that a number of ex-cabinet members and other government officials had been employed by him in connection with the oil leases.

DOHERTY, PHILIP JOSEPH (1856-). An American lawyer, born at Charlestown, Mass., and educated at the School of Law, Boston University. He practiced in Boston from

1877 to 1908; in the latter year, he became attorney to the division of safety of the Interstate Commerce Commission; and in 1913, chief attorney. Beginning in 1884, he held various political offices, including member of the Massachusetts House of Representatives, delegate to the Democratic National Convention, and chairman of the Democratic State Convention (1897). In 1896, he was Democratic candidate for Congress. He was appointed special assistant to the United States District Attorney in cases having to do with certain industrial questions, and in 1900 served as special assistant to the Attorney General in the Mondou-N. Y. N. H. & H. R. R. case. In 1914, he was on the commission to investigate the finances of the New Haven Railroad. In 1918, he was appointed manager of the Property Protection Section of the United States Railroad Administration, and the following year became attorney to the Valuation Bureau of the Interstate Commerce Commission. He is the author of *The Liability of Railroads to Interstate Employees* (1911).

DOHSE, RICHARD (1875-). A German historian, born at Lubz, Mecklenburg. He studied at the universities of Munich, Marburg, Geneva and Rostock, specializing on modern languages and history. He traveled in France and Spain and was journalist, correspondent and editor of various papers. His principal works are: *Colley Cibbers Bearbeitung von Shakespeares Richard III* (1897); a volume of verse, *Aus stillen Stunden* (1902); *Kunst für die Jugend* (1902); several books of verse in Low German (1902-14); *Moderne deutsche Literatur* (1920); *Deutsche Literatur von Anfang bis Hebbel* (1921); and *Das Niederdeutsche Drama* (1921).

DOISY, PELLETIER (?-). A French airman who with Sergeant Besin flew from Paris to Peking (1924) and has made some sensational flights in the Orient. He also made a world's record for altitude with 1500 kilograms of useful load for seaplanes.

DOMBROWSKI, ERICH FRANZ (1882-). A German student of theoretical and practical economy, born in Danzig. He became a well known traveler and editor, and a lecturer at Danzig, Kiel, Berlin and Leipzig. He is the author of *Zehn Jahre deutscher Kulturentwicklung vor dem Kriege* (1915), *Das alte und neue System* (1919), and *Politische Köpfe Deutschlands* (1920).

DOMINIAN, LEON (1880-). An American geographer, born at Constantinople, Turkey. He was graduated at Robert College in 1898 and during 1898-1900 studied at Liège. After two years of travel in Turkey, he came to the United States, and became an assistant on the United States Geological Survey in the Southwest, also serving as an instructor in the New Mexico School of Mines during 1904, after which he spent two years in Mexico. In 1907, he settled in New York City and devoted himself to research and writing, but in 1912 went to Washington as a writer of geographical articles for the *National Geographic Magazine*. He became connected with the Department of State in 1918, serving it on various technical matters, especially with the American Peace Conference in France during 1919. Since 1921, he has been United States Consul in Rome. He served as a delegate to the 12th International Geographical Congress in Toronto in 1913 and

to the 2d Pan-American Scientific Congress held in Washington in 1915. He is the author of *The Frontiers of Language and Nationality in Europe* (1917).

DOMINICAN REPUBLIC. See SANTO DOMINGO.

DONAI. See WAR IN EUROPE, *Western Front*.

DONNAY, MAURICE (1859-). A French dramatic author (see VOL. VII), whose recent work includes: *Alfred de Musset* (1914); *La Parisienne et la guerre* (1916); *L'Impromptu du paquetage* (1916); *Le Théâtre aux armées* (1916). *Premières impressions* (1917); *Lettres à la dame Blanche* (1917); *Pendant qu'ils sont à Noyon* (1917); *La Chasse à l'homme* (1919).

DORGELES, ROLAND (1886-). A French novelist, who came to the front with the publication of his war novels, *Les Croix de Bois* and *Le Cabaret de la Belle Femme*. In spite of the intensity of his subject, his style is that of a sober realism, which is in many ways the equal of the melodramatic pages of Barbusse's *Under Fire*. His other works are: *La Machine à finir la guerre* (in collaboration with Régis Gignoux, 1916); *La Boule les Ailes* (1921); *Saint Magloire* (1921), *Sous les Ailes de mon moulin* (1922); *Le Réveil des morts* (1923). *Les Croix de Bois* and *Saint-Magloire* were translated into English.

DORR, RHETA CHILDE (?-). An American author and social worker (see VOL. VII). She was war correspondent for a syndicate of 21 newspapers during 1917-18, and became foreign correspondent with headquarters at Prague in 1920. Her later books include *Inside the Russian Revolution* (1917), *The Soldier's Mother in France* (1918), and *Czecho-Slovakia* (1921).

DORSEY, NOAH ERNEST (1873-). An American physicist, born at Annapolis Junction, Md. He was graduated in 1893 from Johns Hopkins, where he was a fellow during 1896-97 and received his Ph.D. After serving as a research fellow at the Yerkes Observatory during 1899 he returned to Johns Hopkins and was an associate in physics until 1901, when he entered the service of the government as physicist to the Bureau of Soils in the Department of Agriculture. In 1903, he transferred to the Bureau of Standards, in which he attained the rank of physicist in 1917. In 1921, he assumed a consulting relation with the Bureau in addition to his private practice. His principal investigations have included the physics of the soil, absolute measurements in electricity and physics of the medical sciences, including applications of X-rays. Besides many articles contributed to scientific journals, he is the author of *Physics or Radioactivity* (1921).

DOTTIN, HENRI GEORGES (1863-). A French philologist (see VOL. VII). His most recent works are *Les anciens peuples de l'Europe* (1916) and *La langue gauloise* (1920).

DOUGALL, LILY (1858-). A Canadian novelist (see VOL. VII). Among her recent works are *The Practice of Christianity* (1914), and *The Christian Doctrine of Health* (1916). She was part author of *Concerning Prayer* (1916); *Immortality* (1917); *The Spirit* (1919); *God and the Struggle for Existence* (1919); *Arcades Ambo* (1919), a volume of poems, and *The Lord of Thought* (1922).

DOUGHERTY, PAUL (1877-). An American marine painter, born in Brooklyn,

N. Y. He was graduated from the Brooklyn Polytechnic Institute and the New York Law School and studied art in Europe, spending much of his time in London, Paris, Florence, Venice and Munich. In 1906, he was elected an Associate of the National Academy and the next year he was made a full member. He is also a member of the National Institute of Arts and Letters. Mr. Dougherty's marine paintings have been exhibited all over the United States and in many parts of Europe and include: "October Seas"; "The Road to Cayey"; "Lake Louise" (Metropolitan Museum, N. Y.); "Sun and Storm" (National Gallery, Washington); "Flood Tide" (Carnegie Institute, Pittsburgh); "Storm Quiet" (Chicago Art Institute); "The Land and the Sea" (Corcoran Gallery, Washington); "Autumn Oaks" (Brooklyn Institute Museum). Among Mr. Dougherty's awards was the gold medal from the Panama-Pacific International Exposition in 1915.

DOUGHTY, ARTHUR GEORGE (1860-). A Canadian historian and archivist (see VOL. VII). In 1917, Doughty was attached to the Canadian Expeditionary Force War Archives Survey and in 1919 he accompanied the Prince of Wales as historian on his Canadian tour. Among his later works appear *The Acadian Exiles* (1915), *A Daughter of New France* (1916), and *Notes on the History of Canada Prepared for the Visit of the Prince of Wales* (1919).

DOUGHTY, CHARLES MONTAGUE (1843-1926). An English explorer (see VOL. VII). His work in the period under review was devoted almost entirely to the writing of poetry and poetic drama. *The Titans* appeared in 1916 and *Man-soul, or the Riddle of the World* in 1920.

DOUGHTY, HOWARD WATERS (1871-). An American chemist, born at Baltimore, Md. He was educated at Johns Hopkins University, where he received his Ph.D. in 1905. During 1905-06, he was instructor of chemistry at Missouri and during 1907-08, at Wisconsin, after which he went to Amherst, where he became full professor in 1913. His original investigations have been chiefly in the field of organic chemistry, notably on derivatives of trimethylparaconic and camphoronic acids and on the reactions with various metals of compounds containing the trihalogen methyl group.

DOUGLAS, ROBERT LANGTON (1864-). An English art critic, lecturer, and author (see VOL. VII). Enlisting in the new army in 1914, he became staff captain, War Office, 1916-17. After 1916, he was director of the National Gallery, Ireland. To the literature of Siennese art, as an authority on which he was best known, he contributed in 1914 an edition (second) of *Histoire de Siennese*.

DOUMER, PAUL (1857-). A French statesman (see VOL. VII). He became minister of state in 1917, and was minister of finance during 1921-22.

DOUMERGUE, GASTON (1863-). A French statesman (see VOL. VII). He held the portfolio for the colonies through the ministries of Viviani and Briand until the Ribot Ministry of March, 1917, when he was sent to Russia to persuade the Kerensky government not to make a separate peace with Germany and Austria. He was elected the twelfth President of France on June 13, 1924, the first Protestant to hold that office.

DOURINE. See VETERINARY MEDICINE.

D'OVIDIO, FRANCESCO (1843-). An

Italian philologist (see VOL. VII). He has published, within the last years, *L'avversione di Ruggiero Bonghi alla triplce alianza* (1915), *L'origine della presente guerra* (1915), and *Benvenuto da Imola e la legenda vergiliana* (1916).

DOWLING, AUSTIN (1868-). An American archbishop, born in New York City. He graduated from Manhattan College in 1887, and after studying at St. John's Seminary and the Catholic University, was ordained to the Roman Catholic priesthood in 1891. He served as pastor in Warren, R. I., and from 1905 to 1912 was pastor of Saints Peter and Paul Cathedral. He was consecrated Bishop of Des Moines in 1912 and Archbishop of St. Paul in 1919.

DOWNS, LAWRENCE ALOYSIUS (1872-). An American railway official, born in Greencastle, Ind. He graduated from Purdue University in 1894 and in the following year began his railroad career with the Vandalia road. He occupied many important positions with the Illinois Central Railroad until 1920, when he was elected vice-president and general manager of the Central of Georgia Railroad. He was the author of *Development of Banking in Illinois* (1914).

DOYLE, SIR ARTHUR CONAN (1859-). A British novelist and spiritualist (see VOL. VII). After 1913, Sir Arthur lengthened his already long list of works with: *The Case of Oscar Slater* (1914); *The Valley of Fear* (1915); *A Visit to Three Fronts* (1916); *History of the British Campaign in France and Flanders*, vols. i and ii (1915-20); *Danger* (1918); *His Last Bow* (1918); *The Guards Came Through* (1920). *A New Revelation* (1918); *The Vital Message* (1920), and *The Wanderings of a Spiritualist* (1921), were written in connection with his studies in the field of spiritualism. He lectured and debated on the subject of spiritualism in Europe and America.

DRAFT ACT. See UNITED STATES, History.
DRAFT TREATY OF MUTUAL ASSISTANCE. See WASHINGTON CONFERENCE.

DRAKE, GEOFFREY (1860-). An English sociologist (see VOL. VII). He was active during the War as a member of the Departmental Committees National Register (1915), vice-president of the Royal Statistical Society (1916-18), chairman of the Denison House Committee on Public Assistance (1916), and chairman of the Official Statistics Committee (1919). In 1916, he was attached to the War Office in the Military Intelligence Section, and in the following year was director of the Investigation Board of Agriculture. Among his later works may be mentioned: *Ephemera* (1915); *Reorganization of Official Statistics and a Central Statistical Office* (1916); *Pre-war Statistics of Poland and Lithuania* (1918), and *The Cost of Public Assistance* (1921).

DRAINAGE RECLAMATION. See RECLAMATION.

DRAKE, DURANT (1873-). An American professor of philosophy. He was born at Hartford, and was educated at Harvard and Columbia Universities. In 1912, he joined the faculty of Wesleyan University, and in 1915 became professor at Vassar. He was one of a group of seven who published the *Essays on Critical Realism* (1920). Among his other writings are: *The Problem of Things in Them-*

selves (1911); *Problems of Conduct* (1914); *Problems of Religion* (1916); *America Faces the Future* (1922).

DRAKE UNIVERSITY. An institution at Des Moines, Iowa, founded in 1881. The student enrollment in 1913 was 1594, compared with 1750 in the year 1923-24, with 532 in the summer school of 1923. The faculty in 1913 numbered 80, against 78 in the later year; this figure is exclusive of 19 officers of administration. The library increased from 26,000 to 35,000 volumes. Drake University Municipal Observatory was built by the city of Des Moines in Waverland Park in 1921. Arthur Holmes, Ph.D., succeeded Hill M. Bell as president in 1918 and was in turn succeeded by Daniel W. Morehouse, Ph.D., in 1922.

DREIER, MARY ELIZABETH (1875-). An American social worker, born in Brooklyn, N. Y., and educated in private schools, at home, and at the New York School of Philanthropy. From 1906 to 1915, she was president of the Woman's Trade Union League, subsequently serving on the Executive Committee. From 1911 to 1915, she was a member of the New York State Factory Investigating Commission, and in 1915 was appointed to the Board of Education by Mayor Mitchel. She resigned in order to give all her time to suffrage work, becoming chairman of the Industrial Section of the New York State Woman's Suffrage Party and of the Americanization Committee of the New York State and New York City Woman's Suffrage Party, until 1918. In 1918, she was made chairman of the New York State Committee on Women in Industry of the Advisory Commission of the Council of National Defense and of the Women's Joint Legislative Conference. In 1921, she also became a member of the Industrial Committee of the National Board of the Y. W. C. A., and of the Executive Committee of the New York State Council for the Limitation of Armament.

DREISER, THEODORE (1871-). An American author and journalist (see Vol. VII). His most important later works are: *The Titan* (1914); *The Genius* (1915); *Plays of the Natural and Supernatural* (1916); *A Hoosier Holiday* (1916); *The Hand of the Potter* (1919); *Hey Rub-a-Dub-Dub*, a book of essays and philosophy. From his first novel, he has, with each new book, been accused of immorality. His works show a mind of titanic force dealing with dispassionate insight and compassion with the motives and forces that surround mankind. His extended newspaper work gave him an acute understanding of men and life, and also accounts for his careless, loose style of writing.

DRESEL, ELLIS LORING (1865-). An American diplomatist, born at Boston, Mass., and educated in private schools in the United States, Switzerland and Germany, and at Harvard University. He practiced law in Boston from 1892 to 1915, then went to Berlin as attaché of the American Embassy, and until 1917 was special representative of the State Department there. On the declaration of war by the United States, he was sent to Berne in the same capacity. He organized the Central Committee for American Prisoners, and was the representative in Switzerland of the American Red Cross and of the War Trade Board. He became first secretary of the Legation in 1918, and in the same year, attaché to the Peace Conference

in Paris. He was named honorary counselor to the American Embassy in 1919, but did not enter upon his duties, being appointed American commissioner to Germany in the autumn of the same year. As plenipotentiary of the United States government, he signed the peace treaty with Germany on Aug. 25, 1921. In November of the same year, he became chargé d'affaires in Berlin.

DRESSER, HORATIO WILLIS (1866-). An American author prominent in the New Thought movement. He was born at Yarmouth, Maine, and educated at Harvard University. He began his career in 1879 as telegraph operator and railroad agent in California. He returned to Boston, however, and tried a variety of occupations, finally becoming, in 1896, editor and publisher of the *Journal of Practical Metaphysics*, and, in 1899, of the periodical entitled *The Higher Law*. His writings, which are mostly philosophical, include: *The Power of Silence* (1895); *The Perfect Whole* (1896); *In Search of a Soul* (1897); *Methods and Problems of Spiritual Healing* (1899); *Education and the Philosophical Ideal* (1900); *A Book of Secrets* (1902); *Health and the Inner Life* (1906); *A Physician to the Soul* (1908); *A Message to the Well* (1910); *Human Efficiency* (1912); *The Religion of the Spirit in Modern Life* (1914); *Handbook of the New Thought* (1917), and *The Victorious Faith* (1917). He edited *On the Threshold of the Spirit World* (1919); *A History of the New Thought Movement* (1919); *The Open Vision* (1920); *The Quimby Manuscripts* (1921), etc.

DRESSLER, WILLY OSKAR (1876-). A German writer on art and interior decoration, born in Berlin. His principal works are: *Möbel im Zimmer der Neuzeit* (1901); *Moderne Silbergerate* (1902); *Geschichte des Porzellans* (1904); *Kunstgewerbe oder angewandte Kunst in Beziehung zur künstlerischen Kultur* (1910); *Neugestaltung der Verwaltung der Kunstangelegenheiten im Reich und in den Bundesstaaten* (1917); *Der Eckstein in der Wirtschaft von den Werkleuten vergessen!* (1921).

DRIESCH, HANS A. S. (1867-). A German biologist and philosopher (see Vol. VII). In 1921, he became professor at the University of Leipzig. His writings after the War were largely concerned with speculative and metaphysical problems. Professor Driesch was also very much interested in psychical research and served on committees investigating various spiritistic mediums. His published works after 1914 include *Leib und Seele* (1916), *Wirklichkeitslehre* (1917), and *Wissenschaft und Denken* (1920).

DRINKWATER, JOHN (1882-). An English poet, playwright, and critic, born at Leytonstone, Essex. He was educated at the Oxford High School and served for 12 years as insurance clerk. He then turned his attention to theatrical enterprises and became manager and producer to the Pilgrim Players, who later developed into the Birmingham Repertory Theatre Company. His first volume of poems appeared in 1908 and his first play, *Cophetua* (in verse), in 1911. After several volumes of verse, he published studies in criticism, among them *Critical Studies of William Morris* (1912); *Swinburne* (1913). Since then he has devoted himself to the writing of plays of which *Abraham Lincoln* (1918), is the best

known to Americans. It is a chronicle play and shows sympathetic insight into the personality of the great American. Other plays are *Loyalties* (1919); *Mary Stuart* (1921); *Seeds of Time* (1921); *Oliver Cromwell* (1921); *Preludes* (1922), and *Robert E. Lee* (1923). The last mentioned play was viewed as a complement to his *Abraham Lincoln*, but was not so successful.

DROP BOMBS. See BOMBING OF VESSELS BY AIRCRAFT; ORDNANCE.

DRUMMOND, SIR ERIC. See LEAGUE OF NATIONS.

DRURY, FRANCIS KEESSE WYNKOOP (1878-). An American librarian, born at Ghent, N. Y., and educated at Rutgers College and the University of Illinois. From 1899 to 1903, he was assistant librarian at the Gardner A. Sage library at New Brunswick, N. J.; then went to the University of Illinois library, becoming acting librarian in 1907 and assistant librarian in 1909. In 1919, he was appointed assistant librarian in Brown University library, and became assistant professor in the same university in 1920. In 1918 and 1919, he was employed in the American Library Association War Service. He is known as a compiler and editor. Following are his published works (compilations): *List of Serials in the University of Illinois Library* (1911); *Technical and Scientific Serials in the Library of Providence* (1920); *Some of the Best Dramas* (1917); *Plays of To-Day* (1921).

DRURY COLLEGE. A nonsectarian college founded at Springfield, Mo., in 1873. The number of students increased from 276 in 1914 to 411 in 1924, the faculty from 21 to 25, and volumes in the library from 30,000 to 33,000. The productive funds rose from \$258,165 to \$850,000, and the annual income from \$51,550 to \$85,535. Thomas W. Nadel succeeded James G. McMurtry as president.

DRYDOCKS. See DOCKS.

DUAL NATIONALITY. See JAPAN, History.

DUANE, WILLIAM (1872-). An American physicist, born at Philadelphia, Pa. He was graduated at Pennsylvania in 1892; and received his Ph.D. at Harvard in 1897. During 1907-13, he worked as an investigator at the Curie radium laboratory in Paris, then returned to Harvard, where in 1917 he became professor of biophysics. His principal investigations have been studies on the velocity of chemical reactions, short electrical waves, radium emanations and induced activity, alpha rays of radium, heat effects of radioactive substances, ionization, and absorption and emission spectra of X-rays, on all of which topics he has published valuable papers. During the War, he was chairman of the committee on X-rays in the Section on Physical Sciences of the National Research Council.

DUBOIS, CHARLES GILBERT (1870-). American banker and business man, born in New York City, and educated at Dartmouth. Upon leaving college he entered business with the Western Electric Company in New York and within a little over a decade became secretary and supervisor of the company's branch houses; and in 1919, became president. He was comptroller of the American Telephone and Telegraph Company (1907-18) and of the American Red Cross, Washington, D. C. (1917-18). He has held the presidency or director-

ship of many leading trust companies and banking corporations in the United States.

DUBOIS, LOUIS ERNEST, CARDINAL (1856-). A French ecclesiastical prelate. He was born at Saint Calais, Sarthe, and was ordained priest in 1870. He was curate at Saint-Benoît du Mans in 1895, and passed rapidly through the various grades of the Catholic hierarchy. He was Bishop of Verdun in 1901, Archbishop of Bourges in 1909, Archbishop of Rouen in 1916, and Archbishop of Paris in 1920. He became Cardinal in 1916. Cardinal Dubois was a Knight of the Holy Sepulchre and a member of the Academy of St. Thomas Aquinas. His writings included a number of biographies and historical chronicles.

DU BOIS, WILLIAM EDWARD BURGHARDT (1868-). An American editor and author, born at Great Barrington, Mass., and educated at Harvard and the University of Berlin. During the period 1896-1910, he was editor of the *Crisis* and has since given indication of his keen interest in the advancement of the Negro, in his writings: *The Suppression of the Slave Trade* (1896); *The Philadelphia Negro* (1899); *Quest of the Silver Fleece* (1911); *The Negro* (1915); *Darkwater* (1920). He edited the *Atlanta University Studies of the Negro Problem* (1897-1911).

DU BOSE, HORACE MELLARD (1858-). An American Methodist Episcopal bishop, born in Choctaw County, Ala., and educated at Waynesboro Academy, Mississippi, and with private tutors. He was licensed to preach in the Methodist Episcopal Church in 1876, and three years later was ordained. He was a member of the Mississippi Conference from 1877 to 1880, and held various pastorates from 1881 to 1890. From 1890 to 1894, he was editor of the *Pacific Methodist Advocate* in San Francisco; served in various pastorates for the next three years, and became secretary of the Epworth League and editor of the *Epworth Era* in 1898. From 1910 to 1915, he was again pastor, and from 1915 to 1918 was book editor for the Methodist Episcopal Church of the South, and editor of the *Methodist Quarterly Review* in Nashville. He was elected bishop in 1918, being stationed at Berkeley, Cal. He was a member of the Ecumenical Conference which took place in 1901.

DUGGAN, STEPHEN PIERCE (1870-). An American author and political scientist, born in New York City and educated at the College of the City of New York and Columbia University. He was associate professor and professor of political science at the College of the City of New York (1896-); and director of the Institute of International Education (1919-), the National Commission for Mental Hygiene, and the Council on Foreign Relations. He published *The Eastern Question—A Study in Diplomacy* (1902), *A History of Education* (1916), and *The League of Nations* (1919).

DUGGAR, BENJAMIN MINGE (1872-). An American educator (see VOL. VII). From 1917 to 1919, he was acting professor of biological chemistry at the Washington University Medical School. He edited the department of physiology in *Botanical Abstracts* for 1917, and was editor for the *Annals of the Missouri Botanical Garden* from 1913. Professor Duggar wrote *Mushroom Growing* (1915), and contributed many articles to botanical magazines.

DUGUIT, PIERRE (1859-). A French jurist, born at Libourne, and educated at the law faculty of the University of Bordeaux. He remained in the university as a member of the faculty, and achieved an international reputation as a sociological jurist. He was the author of a number of books and articles on public and private law, of which the most notable is the *Traité de Droit constitutionnel* (3 vols, 2d. ed., 1924).

DUHAMEL, GEORGES (1894-). A French man of letters, born in Paris. A man of prolific talent, he revealed his capacities quite early. With Jules Romains and Charles Vildrac, he represented what has been called the "unanimist" school; that is to say, a conception of literature analogous to the collectivism of a Durkheim in philosophy. Duhamel's *Civilisation* won the *Prix Goncourt* in 1919. His works include: *L'Homme en Tête*; *Selon ma Loi*; *La Lumière*; *Des Légendes*; *Notes sur la Technique poétique*; *Propos critiques*; *Compagnons*; *Paul Claudel*; *Le Combat*; *La Vie des Martyres* (1918); *Dans l'Ombre des statues*; *Civilisation* (1918); *Les Poètes et la poésie*; *La Recherche de la grâce*; *La Possession du Monde*; *Entretiens dans le tumulte*; *Les Hommes abandonnés*; *La Mison des athlètes*; *La Journée des Aueux*.

DULUTH. A city and lake port in Minnesota. The population rose from 78,466 in 1910 to 98,917 by the census of 1920 and to 106,289 by estimate of the Bureau of the Census for 1923. Morgan Park, a model city for workmen, was built during the 10 years between 1914 and 1924 by the Minnesota Steel Company for its employees, within the limits of Duluth. It was served by complete sewer and water systems and concrete paved roads, and had a central playground and hospital. A plan was made for the establishment of primary and secondary civic centres near the lake front, and the cutting of several diagonal streets. McDougall Terminal warehouse opened new lines of lake traffic served by special refrigerator carriers.

DUMAS, GEORGES (1866-). A French psychologist, born at Lédignan (Dept. of Gard), and educated in Paris at the Ecole Normale. He passed both the *agrégation* and the doctorate in philosophy, and took the degree of doctor of medicine. He taught philosophy at the college of Chaptal and later became lecturer on psychology at the Sorbonne as well as chief of the psychological laboratory in the Faculty of Medicine. He was a frequent contributor to the *Journal de Psychologie*, the *Revue Philosophique*, and the *Revue de Paris*. On the death of Ribot he took over the editing of the long projected *Traité de Psychologie*. The first volume of this treatise, with contributions from 30 leading psychologists, appeared in 1923. Professor Dumas's chief interests were in the psychology of affective states. His published works include: *Tolstoi et la Philosophie de l'amour*; *Les Etats intellectuels dans la mélancolie*; *La Tristesse et la Joie*; *Psychologie de deux Messies positivistes* (August Comte et St. Simon); *Le Sourire*; *Névrose et psychose de guerre chez les Austro-Allemands* (1918).

DU MAURIER, GERALD (1873-). An English actor born at Hampstead, and educated at Harrow. His first stage appearance was at the age of 20 at the Garrick Theatre, London. Two years later he joined Herbert Tree in

Shakespearean repertory and also in his father's play *Trilby*. Among his successes are his parts in *Peter Pan*; *The Admirable Crichton*; *Little Mary*; *What Every Woman Knows*, and his leading parts in Conan Doyle's *Raffles* and McCutcheon's *Brewster's Millions*. He wrote the play, *A Royal Rival*, produced by Lewis Waller; also *Charles I* and *Charles II*, with the coöperation of his brother, Guy Louis Bussion du Maurier, and *The Dancers* which was produced in New York during the 1923-24 season.

DUMUR, LOUIS (1864-). A French novelist, born at Geneva, Switzerland and educated at the University of Geneva and at the Sorbonne. His earlier works contained amusing descriptions of Genevese Calvinism. After the War, he developed a patriotic war novel with recitals of German atrocities. His works include *Un Coco de génie* (1902); *Les trois Demoiselles du père Maître* (1909); *Le Centenaire de Jean-Jacques* (1910); *L'Ecole du dimanche* (1911); *Nach Paris!* (1919); *Le Boucher de Verdun* (1921); *Les Défaitistes* (1923).

DUNAJEC RIVER. See WAR IN EUROPE, Eastern Front.

DUNCAN, GEORGE BRAND (1861-). An American soldier, born in Lexington, Ky. He graduated from the United States Military Academy in 1886 and was commissioned 2d lieutenant in the same year. During the Spanish-American War he served as captain of volunteers. He was appointed captain in 1899. He rose through the successive grades, becoming colonel in 1916. In the following year he was appointed brigadier-general N. A., major-general in 1918, and brigadier-general U. S. A. in 1920. He served in the Philippines as a member of the General Staff from 1914 to 1917. From the latter year to 1919 he was with the American Expeditionary Forces in France as commander successively of the 26th Infantry, 1st Division, and the 1st Brigade, 1st Division. He commanded the 77th Division from May to August, 1918, and the 82d Division during the Meuse-Argonne offensive. He was awarded decorations by the British and French governments.

DUNHAM, JAMES HENRY (1870-). An American clergyman and educator, born at Bedminster, N. J., and educated at Princeton University, Princeton Theological Seminary, the University of Berlin and the University of Pennsylvania. He was ordained in the Presbyterian ministry in 1896, and until 1912 was pastor of the First Church at Mt. Holly. In 1914, he began his work as educator, teaching in the Haverford (Pa.) School and holding the position of professor of ethics in the College of Liberal Arts and Sciences at Temple University, Philadelphia, in 1914-15. In 1920, he was appointed student counsellor on the Federal Board of Vocational Education. He is the author of *Freedom and Purpose—The Psychology of Spinoza* (1916), and *John Fourteen* (1917).

DUNKERS, or DUNKARDS. See BRETHREN, CHURCH OF THE.

DUNLAP, KNIGHT (1875-). One of the leading American experimental psychologists. He was born at Diamond Spring, Cal., and was educated at the University of California. In 1906, he joined the faculty of Johns Hopkins University, becoming full professor in 1916. He was president of the American Psychological Association for the year 1922. His works include: *A System of Psychology* (1912);

Outline of Psycho-biology (1914); *Personal Beauty and Racial Betterment* (1920); *Mysticism, Freudianism and Scientific Psychology* (1920); *Outlines of Psychology* (1923).

DUNN, ARTHUR WILLIAM (1868-). An American educator, born at Galesburg, Ill., and educated at Knox College and the University of Chicago. He began his career as instructor in English and lecturer in sociology at the University of Cincinnati (1896-98). He was also extension lecturer from 1896 to 1900, and from the latter year until 1910 headed the department of history and civics in the Shortridge High School, Indianapolis. From 1906 to 1910 he was director of civic education in the public schools in the same city; in 1910-11, he was civic secretary of the City Club of Philadelphia; in 1911-14, he served as executive secretary of the Public Education Association, New York City; and from 1914 to 1921, he held the office of specialist in civic education in the United States Bureau of Education. In 1920, he was appointed special adviser to the United States Navy in the civic education of men on shipboard, becoming, in the following year, associate national director of the Junior Red Cross, and being advanced to the position of national director in 1921. He is the author of: *The Community and the Citizen* (1907); *The Teaching of Community Civics* (with others; 1915); *Social Studies in Secondary Education* (1916); *Citizenship in School and Out* (with Hannah Margaret Norris; 1920); *Community Civics and Rural Life* (1920); *Community Civics for City Schools* (1921).

DUNN, SAMUEL ORACE (1877-). An American transportation specialist (see Vol. VII). He wrote *American Transportation Question* (1912); *Government Ownership of Railways* (1913); *Railway Regulation or Ownership?* (1918). He also contributed articles to periodicals and lectured frequently on transportation subjects.

DUNNING, WILLIAM ARCHIBALD (1858-1922). An American educator and political scientist (see Vol. VII). He published *The British Empire and the United States* (1914), and a *History of Political Theories* (3 vols., 1902-20).

DUNSANY, EDWARD JOHN MORETON DRAX PLUNKETT, eighteenth BARON (1878-). An Irish author and playwright, born in London and educated at Eton and Sandhurst. He served in the South African War with the Coldstream Guards. In the recent War, he was Captain of the Royal Inniskilling Fusiliers and was wounded in 1916. Many of Dunsany's works are laid in the Golden Age of Spain and are saturated with the romantic spirit of medieval gloom and colored adventure. Though apparently approved of by the public, he has been characterized by sceptical critics as too volatile and entirely wanting in genuine national spiritedness. His publications include: *The Gods of Pegana* (1905); *Time and the Gods* (1906); *The Sword of Welleran* (1908); *A Dreamer's Tales* (1910); *Tales of War* (1918); *Unhappy Far-off Things* (1919); *Tales of Three Hemispheres* (1920); *The Chronicles of Rodriguez* (1922). Among his plays are: *The Glittering Gate* (1909); *King Argimenes* (1911); *The Gods of the Mountain* (1911); *The Golden Doom* (1912); *The Tents of the Arabs* (1914); *A Night at an Inn*; *If* (1921).

DUPRÉ, MARCEL (1886-). A famous French organist, born at Rouen. Under his father's instruction, his progress was so rapid that at the age of 12 he became the regular organist at St. Vivien. Later he entered the Paris Conservatoire, where he carried off the first prize for piano in 1905. In 1914, he won the Prix de Rome with the cantata *Psyché*. His meteoric rise to fame began in 1916, when he took Vierne's place at Notre Dame during the latter's protracted illness. In 1920, he created a sensation by playing from memory, in 10 recitals, all the organ works of Bach. Immediately after that event he made a sensationally successful tour of England. On Nov. 18, 1921, he made his American début with the inauguration of the great organ in the Wanamaker Auditorium in New York, exhibiting at the same time his marvelous powers of improvisation.

DURALUMIN. An alloy of Aluminium and Magnesium. See ALUMINIUM; MOTOR VEHICLES.

DURAND, E. DANA (1871-). An American statistician (see Vol. VII). He was employed by the United States Food Administration from 1917 to 1919, and was adviser to the food minister of Poland from 1919 to 1921. In 1921, he was chief of the Eastern European Division of the United States Bureau of Foreign and Domestic Commerce. He contributed articles on economic and political subjects to many economic journals, and in 1915 published *The Trust Problem*.

DURAND, ELIAS JUDAH (1870-1922). An American botanist, born at Canandaigua, N. Y. He graduated from Cornell University in 1893 and was assistant botanist in the experiment station at that university (1895-96) and instructor in botany from 1896 to 1910. In the latter year, he was appointed assistant professor of botany at the University of Missouri, and during the years from 1918 to 1922 was professor of botany at the University of Minnesota.

DURHAM, HENRY WELLES (1874-). An American civil engineer, born in Chicago. He graduated from the School of Mines at Columbia University in 1895, and was engaged on surveys with the United States Geological Survey, and with the United States Nicaragua Canal Commission and with the Isthmian Canal Commission. From 1900 to 1904, he was assistant engineer in charge of construction of the New York subway, and was resident engineer in charge of municipal improvements in Panama, from 1904 to 1907. From the latter date to 1912, he was in charge of the surveys and construction of the Cape Cod Canal, and from 1912 to 1915 was chief engineer of highways for Manhattan Borough. He was a member of the New York National Guard and served on the Mexican border in 1916. He was appointed major of engineers in 1917 and was given command of the 41st Engineers, which he commanded in France. For a time he was in charge of forestry operations in France and later was in charge of road maintenance. He was honorably discharged in October, 1919. In 1920-21 he was engaged in making plans for the sanitation of several cities in Peru. He wrote *Street Paving and Maintenance in European Cities* (1915).

DURKHEIM, ÉMILE (1858-1916). A French philosopher (see Vol. VII). He published a

number of brochures on the War and was honored by the French government with the cross of the Legion of Honor. He died in 1916, grief-stricken by the killing of his son at the front. The sociological method of approaching philosophical problems, which he founded, was continued by a host of disciples, among whom may be mentioned Bouglé, Hubert and Mauss.

DUSE, ELEONORA (1850-1924). An Italian actress (see VOL. VII). While on an American tour which began in the latter part of 1923, she became seriously ill with a cold and general nervous breakdown, and died at Pittsburgh, Apr. 21, 1924. Her last appearance at the Metropolitan Opera House in New York was an ovation, every seat and all the standing room being occupied. Not only was great grief caused by her death in her native land, Italy, but artistic circles throughout the world mourned and paid tribute to probably the greatest actress of her time.

DUST EXPLOSIONS. See **CHEMISTRY, ORGANIC.**

DUTCH EAST INDIES (NETHERLANDS INDIA). The Dutch possessions in the Malay Archipelago. They have a total area of 733,642 square miles, and a population, by the census of 1920, of 49,350,834. The 1905 census figure was 38,070,782. In 1920 there were 169,355 Europeans, 48,112,706 natives, and 878,986 other Orientals, mostly Chinese and Arabs. By administrative divisions, the 1920 population was divided among Java and Madura (34,984,171), and the Outer Possessions, i.e. the Island of Sumatra (5,852,135), Riau-Lingga Archipelago (223,122), Banca (154,141), Billiton (68,582), Borneo, West Coast (605,402), Borneo, South and East Districts (1,020,599), Island of Celebes (3,108,337), Molucca Islands (622,671), Timor Archipelago (1,146,660), Bali and Lombok (1,565,014). New Guinea was included. Populations of the leading cities in 1920 were Batavia, 2,787,000; Soerabaya, 2,460,000. Semarang, 2,737,000. The great mass of the natives were Mohammedan in faith. Education made steady advances. In 1922 there were 508 public and private schools serving Europeans and people associated with them. Total attendance was 89,382, and expenditure on education amounted to 14,186,399 guilders, a guilder equaling \$40. There were also 13,138 native schools, with an attendance of 947,015, maintained at a cost of 19,594,992 guilders.

Industry. The majority of the population worked on the land. Total area in use for private agriculture in the whole territory in 1920 was 7,576,000 acres, of which 3,010,000 were in Java; 1,358,900 acres were in lease and 1,651,000 privately owned. Europeans held most of the land leases in Java. Sugar remained the crop of greatest economic importance, and in 1920, 183 factories were serving the industry. The following table indicates the condition of native activities before and after the War as shown in exports, in metric tons:

	1913	1918	1921	1922
Sugar	1,471,428	1,540,100	1,677,137	1,435,808
Coffee	26,019	7,300	43,683	57,360
Tea	26,545	29,958	35,863	41,552
Tobacco	87,832	8,050	46,214	52,087
Rubber	7,087	44,096	73,505	104,942
Copra	229,339	68,578	311,571	339,465
Tin	2,153	11,584	13,547	15,457

Native cultures were rice, maize, cassava, potatoes, coconuts. The live stock industry also

flourished. The government largely controlled the mines. In 1921, the principal coal mines in Java, Sumatra, and Borneo yielded 1,212,665 tons; the tin mines yielded 27,700 tons; and the principal mineral oils, 2,361,509 tons. The oil fields were controlled by the Royal Dutch and Shell Companies. Gold was worked in Sumatra and diamonds in Borneo.

Trade. Total imports, both government and private, exclusive of specie, for the years 1913, 1921, and 1922, were 463,702,000, 1,192,963,000, and 756,391,000 guilders. Exports, similarly, for 1913, 1921, and 1922, were 671,434,000, 1,190,799,000, and 1,142,217,000 guilders. The 1920 export amounted to 2,263,447,000 guilders. The Dutch East Indies' great importance as a market for manufactured goods and a source of raw materials was being recognized by foreign commercial houses. In particular, British, Japanese, Swedish, Belgian, Danish, and German interests were active. Imports from the United States for 1913, 1920, and 1923 were valued at \$3,358,164, \$59,018,190, and \$12,089,786. Exports to the United States were valued at \$4,995,150, \$167,410,000, and \$54,889,400. Shipping entered in 1913 was 6253 steamers of 5,046,000 tons and 2664 sailing vessels of 192,000 tons; in 1921, 9603 steamers of 5,359,737 tons and 6656 sailing vessels of 371,896 tons. Chief ports were Tanjong Priok (for Batavia), Soerabaya, Semarang, Cheribon, and Tegal in Java, Padang and Belwan Deli in Sumatra; Balikpapan in Borneo, Macassar in Celebes.

Communications. In January, 1921, there were 1989 miles of railway both state owned and private; 1721 miles in 1913. Of the former, 1690 were in Java and 299 in Sumatra. Government telegraph and cable lines were 14,748 miles, compared with 12,319 in 1913.

Government. Superior administration was in the hands of the governor-general. A council of five with power of a legislative and advisory nature sat for the whole territory. In 1917 a Volksraad or people's council was erected, with powers to discuss the budget and advise the government. Made up of some 40 members, it included Europeans, natives, and foreign Orientals. The 1913 and 1923 budgets showed revenues of 305,373,000 and 614,080,000 guilders and expenditures of 317,810,000 and 806,942,000 guilders. Deficits were covered by loans. The public debt on Jan. 1, 1923, was 761,683,000 guilders. Extraordinary expenditures of the decade 1913-23 went toward the improvement of the Outer Possessions and the encouragement of industries. Revenues came largely from sales of opium in India, import, export, and excise duties, land revenues, coal, and income taxes. The Dutch East Indies continued peaceful during the decade and Dutch neutrality during the War assured the colony an unchecked prosperity. Progress was steady in the development of the Outer Possessions.

DUTCH NATIONALISTS. See **SOUTH AFRICA, UNION OF.**

DUTCH REFORMED CHURCH. See **PRESBYTERIAN CHURCH.**

DUVENECK, FRANK (1848-1919). An American painter, sculptor, and etcher (see VOL. VII). Known as one of the finest technical painters of the United States, he was, up to the time of his death, Jan. 3, 1919, an active figure in American and English art circles. During his later years, after a long period of study and of teaching in Florence, he served

as instructor in the Art Academy of Cincinnati. His "Whistling Boy," reminiscent of Hals, and "Forget-me-not Girl," after the manner of Rembrandt, also his "Portrait of Professor Loeffts," were generally held to be his finest works.

DVORSKY, MICHEL. See **HOFMANN, JOSEF.**

DYER, WALTER ALDEN (1878-). An American author and journalist, born at Roslindale, Mass., and educated at Amherst College. He began on the staff of the *Springfield Union* (Mass.) in 1901, and for the next six years edited various publications, subsequently becoming managing editor of *Country Life in America* (1906-14). He has contributed innumerable articles to magazines, and has written

many publications which include: *The Lure of the Antique* (1910); *The Richer Life* (1911); *Pierrot, Dog of Belgium* (1915); *Creators of Decorative Styles* (1917); *Handbook of Furniture Styles* (1918); *Sons of Liberty* (1920)

DYER, SIR WILLIAM TURNER THISTLETON (1843-). An English botanist (see Vol. VII). From 1908 to 1916, he was representative of the University of Oxford at the Gloucestershire Education Committee, and from 1909 was a member of the University of Bristol.

E

EARLHAM COLLEGE. A coeducational institution at Richmond, Ind., founded in 1859. The student enrollment increased from 413 in 1914 to 510 at the beginning of 1924, the faculty from 32 to 42 members, and the number of volumes in the library from 19,000 to 30,000. The yearly income increased likewise from \$25,118 in 1914 to \$108,537 in 1924. President, David M. Edwards, Ph.D.

EARTH, AGE OF. See GEOLOGY; PHYSICS.

EARTH INDUCTION COMPASS. See NAVIGATION.

EARTHQUAKE, JAPANESE. See JAPAN, *Effects of Earthquake*, and *History*. See also EARTHQUAKES.

EARTHQUAKES. About noon on Sept. 1, 1923, Tokyo, Yokohama, Nagoya, and many villages and pleasure resorts of Japan were almost entirely wiped out, in the greatest earthquake disaster of history. Earthquake, fire, and sea-wave took a toll of 200,000 lives and hundreds of millions of dollars in property over an area of about one square degree dwarfing into insignificance each of the long list of similar disasters in the past for which Japan, the most seismic region of the globe, is noted.

The Japanese Islands lie in a series of island festoons fringing the Asiatic Continent, with their convexities facing the Pacific. Outside these festoons, and not far from them, are long narrow troughs in the sea floor, running parallel to the trend of the island groups. The troughs are the downward, and the island festoons the upward, curves of great folds in the crust of the earth; in many cases the folding movement is still going on. Stresses accumulate until suddenly relieved by faulting. The convex side of the festoon slopes more steeply than the other. The Japan Sea to the West is shallow, but on the Pacific side, between the Japan coast and the Kurile Islands, the earth's crust in one place plunges down into the great Tuscara Deep nearly 27,000 feet, within 110 to 240 miles of the coast. The earthquakes of Japan follow a rule which is general in such cases: they are most numerous and violent on this steep slope. The epicentre of the 1923 quake appears to have been under Sagami Bay, the floor of which underwent great changes, or in the Uraga Channel; the focus was probably shallow.

The first and greatest shock came at 11.58.44 A.M.; there were no foreshocks to give warning. An unusually large number of aftershocks were recorded, 1039 in the five days following the quake, implying that the faulting movement had a pronounced vertical component. The greatest aftershocks were those on Sept. 2, 1923, and Jan. 14, 1924. In Tokyo, 12 square miles were swept by the fire that followed the quake. Modern reinforced concrete structures especially designed to withstand earthquakes came through with a fine showing; the better constructed brick buildings also survived both quake and fire, although in general the brick buildings

proved unusually dangerous. From 1914 to 1921, 199 earthquakes, some semi-destructive, originated around Tokyo, but the immediate neighborhood of Tokyo was quiet. This fact led Omori to forecast a commencement of seismic activity in the latter district after the others had become quiet, since they are all in the same seismic zone; in 1922 he predicted the occurrence of severe shocks within six years.

An earthquake of truly appalling magnitude took place on Dec. 16, 1920, near Pingliang, Kansu, China. The region was thickly populated; many of the people lived in caves in the hillsides, and were buried alive by the landslides; others slept on clay platforms under which fires were kept burning, and such of these as escaped being dropped into the fires were left to die of the cold. The estimates of deaths vary from 100,000 to 1,000,000. The tremor was felt in Tokyo, 1000 kilometers away.

In the diastrophic shock in Central Italy, Jan. 13, 1915, the ratio of deaths to population was the highest ever recorded. Thirty thousand people perished, including 97 per cent of the population of Lapelle, and 90 per cent of the 11,000 inhabitants of Avezzano. Yet the shock was by no means of the first order of magnitude, and the destruction was chiefly due to the faulty construction of buildings. A strong tectonic quake, registered all over the globe, was associated with the eruption of Sakura-jima, Jan. 12, 1914; the epicentre was near the volcano, and the quake was of a character entirely different from that of the usual local volcanic quake.

The more important of the great number of other earthquakes which occurred during the decade 1914-24 were: 1914, May 9, Sicily; 100 lives lost; Linera totally wrecked. 1916, Alaska, a severe quake, but the region affected was almost entirely uninhabited. 1917, June 7, San Salvador nearly destroyed; Dec. 25-29, Guatemala laid in ruins. 1918, Feb. 13, Swatow, China, several hundred perished; Oct. 11 and 22, Porto Rico, 150 lives lost, and a great deal of property destroyed; Apr. 21-23, considerable damage to property in southern California. 1919, Apr. 28, San Salvador partly destroyed; Nov. 27, several villages destroyed in western Asia Minor, and many lives lost; June 29, Central Italy shaken. 1920, May 14, heavy damage in Central Italy; Sept. 7, Carrara and surrounding territory suffered heavily, with 100 towns damaged or destroyed, and hundreds perished; January, southern Mexico; February, Transcaucasia, many villages destroyed; June 22, Los Angeles, Cal., considerable property damage. 1922, Jan. 31, a severe shock occurred off the California coast, resulting in minor damage at several points; Nov. 11 and afterward, Chile, many lives and much property lost. 1923, near Lou-ho-kien, China, 1000 lives lost; May and Sept., Persia; disastrous shocks, Dec., Columbia and Ecuador; Sept., Calcutta, little damage. 1924, Mar. 14-15, five Costa Rican towns destroyed, with con-

siderable loss of life; Apr. 14, southeast of Mindanao, a severe quake.

During 1915-23, inclusive, the average annual number of earthquakes reported from the continental United States was 106. Many of these, particularly in the Mississippi Valley region, were widespread, but little or no damage resulted from any of them. See SEISMOLOGY and GEOLOGY.

EAST AFRICA PROTECTORATE. See KENYA COLONY.

EAST RUSSIA. See WAR IN EUROPE, *Eastern Front*.

EASTON, FLORENCE (1884-). A British dramatic soprano, born at Middlesbrough-on-Tees, Yorkshire. She was educated in Toronto, Canada, where, at the age of 10, she made her first public appearance as a pianist. Subsequently she studied singing at the Royal Academy of Music in London and with E. Haslam in Paris. In 1903, she made her debut as Cio Cio San with the Moody-Manners Opera Company at Covent Garden. The next year Savage engaged her to sing Kundry for his production of *Parsifal* (in English), which he took on an extended tour of the United States, and in 1906-07 she returned under the same manager, singing in *Madame Butterfly*. From 1907 to 1913, she sang leading rôles at the Royal Opera in Berlin and from 1913 to 1915 at the Stadtheater in Hamburg. At the same time, she appeared at Covent Garden in the Wagner and Strauss performances. From 1915 to 1917, she was a member of the Chicago Opera Company, and then went to the Metropolitan Opera House, New York, where she immediately became one of the prime favorites. In 1904, she married Francis MacLennan, the tenor.

EATON, JAMES SHIRLEY (1868-). An American railway specialist, born in Nashville, Tenn. He graduated from Marietta College in 1889 and for several years was traveling auditor of the Southern Railway. He served as expert in the adaptation of the electric tabulating machines for railroad accounting, and from 1899 to 1903 was statistician for the Lehigh Valley Railroad. After serving as railroad editor for the *Wall Street Journal*, he became railway statistician. He lectured in the Tuck School at Dartmouth and on railroad transportation at New York University. He wrote *Railroad Operation* (1900); *Education for Efficiency in Railroad Service* (1910); *Railroad Expense Handbook* (1911). From 1917 to 1920, he was examiner for the Federal Trade Commission.

EATON, WALTER PRICHARD (1878-). An American author and critic, born at Malden, Mass., and educated at Harvard. During the period 1900-08, he was successively reporter on the *Boston Journal*, a member of the dramatic department of the *New York Tribune*, and dramatic critic of the *New York Sun*. He was dramatic critic of the *American Magazine* (1909-18), and instructor at the School of Journalism of Columbia University. He is the author of many juvenile stories and publications on the theatre, which include: *The American Stage of To-Day* (1908); *At the New Theatre and Others* (1910); *Barn Doors and Byways* (1913); *Plays and Players* (1916); *In Berkshire Fields* (1919); *On the Edge of the Wilderness* (1920).

EBERLE, ABASTENIA ST. LEGER (1878-). An American sculptor, born in Webster City,

Ia. She studied modeling with Frank Vogan in Canton, Ohio, and at the Art Students' League, New York, with George Grey Barnard. She was elected an Associate of the National Academy in 1921. Her first sculptures were copies of old gravestones in the cemetery at Canton. In New York, she found her inspiration in the life of the East Side, which she has interpreted with a great deal of sympathy. Some of her sculptures, "The Girl on Roller Skates" and "Mowgli," are in the Metropolitan Museum, N. Y. "Little Mother" is in the Chicago Art Institute. Others are at the Worcester Art Museum, Carnegie Institute and other centres. She has exhibited in Europe with success.

EBERLE, EDWARD WALTER (1864-). An American naval officer, born at Denton, Texas, and graduated from the United States Naval Academy in 1885. He served on the *Oregon* in the Spanish-American War, in the Philippine insurrection in 1899, and commanded the Atlantic torpedo fleet from 1911 to 1913. He was superintendent of the United States Naval Academy from 1915 to 1919, and practically rebuilt its general organization and educational system. During 1921 and 1922 he was commander in chief of the Pacific fleet, with rank of admiral, and the administrative ability which he showed in this post, as well as in the many other important places which he had filled throughout his career, led to his appointment in 1923 as Chief of Naval Operations in the United States Department at Washington.

EBERT, FRIEDRICH (1871-1925). A German statesman, born at Heidelberg. After an elementary education, he learned the saddler's trade, became a journeyman, and finally settled in Bremen. He was actively interested in the Social Democratic party, edited the *Bremer Volkszeitung* in 1893, and was trade-union secretary to the Bremen Burgerschaft in 1900. It was not till 1905, when he was appointed to the Executive Committee of the Social Democratic party, that he became widely prominent in politics. He was sent to the Reichstag in 1912, and was an influential member of his group. He strongly advocated that the working people should defend their country, and tried to obtain a concerted action of all Socialists. He also tried to reconcile the German and Russian interests, but failed. He attended the conference of Socialists at Stockholm in 1918. A strong opponent of the Spartacists, Bolsheviks and Communists, he did more perhaps than any one else to restore order to the country and to suppress insurrections during the revolution in 1918. He was elected first president of the Reich on Nov. 12, 1919, and his term of office was afterwards extended to 1925. He had a strong influence on the intellectual leaders of Germany, many of them becoming converted to the republican idea through contact with him.

ECKERT, CHRISTIAN L. M. (1874-). A German economist, born at Mainz and educated at the universities of Munich, Berlin and Gießen. In 1900, he became law assistant; in 1901, he was called to the University of Berlin as lecturer in political science. The same year he was appointed to fill a similar position in the *Handelshochschule* (School of Commerce) in Cologne, and in the following year he was made professor of political science in Cologne. In 1904, he was called to the University of Bonn. In 1917, he was made *Geheimer Regierungs-*

Rat (Privy Councillor), and in 1919-20, first director of the University of Cologne, which had just been founded. His numerous works include: *Der Fronbote im Mittel-Alter* (1897); *John Ruskin* (in *Schmollers Jahrbuch* XXVI; 1902); *Deutsche Seefahrten nach Sudamerika* (in *Schmollers Jahrbuch*: 1904); *Peter Cornelius* (1906); *Bildungsfrage des Journalistenstandes* (1913); *Die wirtschaftliche Bedeutung des Wehrbeitrages, Recht und Wirtschaft* (1914); *Wirtschaftliche und finanzielle Folgen des Friedens von Versailles* (1921). He contributed many scholarly articles to leading periodicals, and edited *Rothschilds Taschenbuch fur Kaufleute* (58th ed., 1920).

ECKLES, CLARENCE HENRY (1875-). An American professor of dairy husbandry, born in Marshall Co., Ia. He graduated from the Iowa State College in 1895, and took post-graduate courses at the University of Wisconsin and in Germany and Switzerland. After a year as assistant in dairy husbandry in the Iowa State College, he became professor of dairy husbandry at the University of Missouri, remaining there until 1919, when he was appointed chief of the dairy husbandry division of the University of Minnesota. He wrote *Dairy Cattle and Milk Production* (1911), *Dairy Farming* (1916), and also wrote many bulletins on agricultural subjects and lectured on these subjects in many States.

ECOLOGY. See **BOTANY**; **ZOOLOGY**.

ECONOMIC ENTOMOLOGY. See **ENTOMOLOGY**, **ECONOMIC**.

ECONOMIC GEOLOGY. See **GEOLOGY**.

ECONOMIC ZOOLOGY. See **ZOOLOGY**.

ECUADOR. A South American Republic on the northwest coast between Colombia on the north and Peru on the south. Its area is estimated at 116,000 square miles, but because of still unsettled boundary disputes it cannot be definitely fixed. A maximum claim put the area as high as 276,000 square miles. The estimated population was 2,000,000. Quito, the capital city, had 80,000 inhabitants. Other large cities, with their populations, were Guayaquil, 96,000; Cuenca, 30,000, and Riobamba, 10,000.

Industry. Cacao was the principle crop; the total number of trees was between 80,000,000 and 100,000,000, with an annual yield of 42,000 metric tons. Exports of cacao beans in 1922 amounted to 45,018 metric tons compared with 38,224 metric tons in 1912. Coffee was increasing in importance, with an annual production from 6,000 to 10,000 metric tons. The exportation of tropical fruits such as oranges, bananas, and pineapples to the countries to the south was also important. The production of cotton, lentils, rice, sugar, and tobacco was increasing; ivory nuts and rubber were important forest products, although the output of lumber showed a great decrease toward the end of the period 1914-24. Annual exports of Panama hats were valued about \$600,000. The only mining of importance was carried on by one gold mining company whose output in 1922 was \$877,646 in the form of concentrates. The oil fields of Santa Elena, worked by British companies, were producing 50,000 barrels by 1922 and even more in 1923. In 1922 exports were \$12,033,904 and imports \$8,726,594; the United States took 40 per cent of the exports and furnished 46 per cent of the imports. Cacao constituted 76 per cent of all exports. Principal imports were textiles, foodstuffs, and hardware. Ecuador in 1924

was still suffering from economic depression after the inflation of 1920, and its foreign trade showed little permanent gain during 1914-24. Total exports in 1912 were \$13,689,696 and imports \$10,354,564. The country had only a few small manufacturing plants.

Communications. Little building of railways was done in the period 1914-24. Several short lines were projected and partially completed, notably those from Ambato to Curaray and from Quito to Esmeraldas. In 1923, 400 miles were in operation and 200 miles more were under construction. Wireless telegraph stations were erected at Quito, Guayaquil, and Esmeraldas.

Education. After 1915 the educational organization underwent a series of changes. New curricula were introduced in the primary schools in 1916 and in the normal schools in 1917. In 1922, the 1718 schools in operation were attended by 108,920 pupils as compared with 70,000 in 1911. There were secondary schools in all the provinces but Esmeraldas, and universities at Cuenca, Guayaquil, and Quito.

Finance. The government budget continued to show annual deficits, so that in Dec. 31, 1922, the public debt was 70,101,412 sucres as compared with 40,625,000 sucres in 1914. The budget for 1913 carried revenues and expenditures at \$9,921,000; in 1921, revenues were \$7,927,697, and expenditures \$10,437,720. Interest and amortization of the foreign debt were steadily accumulating because of the fall in revenues. There was serious talk in 1922 of accepting the United States Standard Oil Company's offer of a loan of \$23,000,000. In 1923, the government accepted an English syndicate's loan of \$18,000,000. This was to be guaranteed by customs receipts and was to be applied to the payment of the government's indebtedness of 17,579,393 sucres to the local banks in 1922 and for the interest due on railway bonds. Up to 1914, exchange was maintained at par (1 sucre = \$0.487). The outbreak of the War caused the suspension of the gold conversion of paper, and with the continuing unfavorable trade balance, the value of the sucre steadily fell. From 1917 on, the government attempted to fix a legal exchange rate but an open-market rate prevailed. In December, 1923, the official rate was 4.0 sucres to the dollar, and the street rate, 5.9 sucres.

History. Internal affairs were turbulent well into 1915 under President Plaza. Under President Baquerizo, 1916-20, the administration was busied with fiscal affairs, in which the demands of the Guayaquil & Quito Railroad Company, the leading holder of the foreign debt, played a prominent part; the country was also involved in difficulties with the belligerent nations. The Allies protested against Germany's use of the Galapagos Islands as coaling stations, and in spite of official disclaimers Ecuador's neutrality was questioned. In 1917, however, diplomatic relations with Germany were severed and Ecuador thus technically became a member of the Allied and Associate Powers. Up to 1924 it had not joined the League of Nations. By the treaty of 1916, a boundary commission was appointed to adjust the frontier between Ecuador and Colombia; the work was finished in 1919. The work which was commenced under General Plaza in the cleaning up of Guayaquil in 1913 was renewed in 1918 under Colonel Gorgas and came to a satisfactory conclusion two years

later. In 1920 it was officially reported that the danger of yellow fever had been eliminated not only in Guayaquil but in several adjacent provinces. In 1920 an unsuccessful attempt was made by a British company to purchase the Galapagos Islands with a view to exploiting their valuable guano deposits. The president of Ecuador for 1920-24 was Dr. José L. Tamayo; for the term 1924-28, Dr. Gonzalo S. Cordoba.

EDDY, SHERWOOD (1871-). An American author and a secretary of the Young Men's Christian Association, born at Leavenworth, Kan., and educated at Yale. As a national secretary of the Y. M. C. A., he worked in an honorary capacity among students in Japan, Korea, China, India, the Near East and Russia. Besides works published in England and India, he wrote: *The Awakening of India* (1911); *The New Era in Asia* (1913); *The Students of Asia* (1915); *Suffering and the War* (1916); *With Our Soldiers in France* (1917); *Everybody's World* (1920).

EDGAR, WILLIAM CROWELL (1856-). An American editor and publisher, born at La Crosse, Wis., and educated at a St. Louis high school. He became manager (1882) and editor (1886) of the *Northwestern Miller*, and subsequently president of the Miller Publishing Company. For his part in the relief given to Russian peasants in 1891, he was decorated by the Emperor of Russia. During the War he assisted in the Belgian Relief movement and aided Herbert Hoover in the organization of the American milling industry. His publications include: *Story of a Grain of Wheat* (1903); *Brief in Behalf of American Millers* (1913); *Food Control and Food Fallacies* (1917); *England During the Last Months of the War* (1918); *Rhymes of a Doggerel Bard* (1921).

EDISON, THOMAS ALVA (1847-). An American electrician and inventor. His work in the decade was devoted chiefly to the perfection and improvement of inventions already made. At the outbreak of the War he designed, built and operated successfully benzol plants, carbolic acid plants, and plants for the making of aniline salt and other products. In July, 1915, he was appointed president of the Naval Consulting Board, and in this capacity performed valuable service to the government, for which he made many more inventions. He created lively interest and discussion, in 1923, by the publication of a questionnaire which he was accustomed to submit to college students who applied to him for employment. It comprised questions of wide scope on almost every possible subject, and was designed to test the general knowledge of the applicants. Its usefulness as such a test was much discussed in the public press.

EDMUNDSON, GEORGE (1848-). An English clergyman and historian (see Vol. VII). In 1922, he published *A History of Holland* (Cambridge Historical Series), and *The Journal, Travels, and Labours of Father Samuel Fritz, in the River Amazon, 1686-1723*. The latter was translated and edited from the original Spanish manuscript for the Hakluyt Society.

EDSON, KATHERINE PHILIPS (Mrs. CHARLES FARWELL EDSON) (1870-). An American social worker and feminist, born at Kenton, Ohio, and educated in private schools. She devoted her life to problems of public health and industry, and to woman's rights. From 1910 to 1916, she was a member of the State Board

of the California Federation of Women's Clubs. In 1912, she served on the Charter Revision Commission of Los Angeles, and in the same year became a member of the Progressive party's State Central Committee of California, serving for four years. Well known as an arbiter in labor disputes, she was responsible for the Minimum Wage Bill which the California Legislature passed in 1913. From 1916 to 1920, she was a member of the executive committee of the Republican State Committee, and subsequently a delegate to the Republican National Convention (1920), and a member (1920-24) of the executive committee of the Republican National Committee. In 1921, she became a member of the advisory committee of the Conference on the Limitation of Armaments. She has also been member of the executive committee of the National League for Woman's Service, and executive officer of the Industrial Welfare Commission.

EDSTROM, DAVID (1873-). A sculptor, writer, lecturer and teacher who came to the United States in 1880 from Hvetlanda, Sweden, where he was born. At 21 he decided to study art, and worked his way to Stockholm, where he attended the technical schools and the Royal Academy of Fine Arts as a pupil of Borjison. He then went to Florence and Paris, where he studied with Injalbert. He has exhibited in most of the leading cities of the United States and Europe and is best known for his metaphysical sculptures, "Fear," "Pride," "Envy," "Caliban," "The Cry of Poverty." An artist of versatile moods, Edstrom always shows in his work the psychic character of his subject. He has made portrait busts of many important persons.

EDUCATION, AGRICULTURAL. See AGRICULTURAL EDUCATION.

EDUCATION IN THE UNITED STATES. The report of the United States Commissioner of Education published in 1923 gives the statistics of attendance in elementary schools for 1919-20. The enrollment in public kindergartens was 481,266 and in private kindergartens 29,683, making a total of 510,949. In the elementary schools including the primary and grammar grades there were 18,897,661 pupils in the public schools and 1,485,561 in the private schools, totaling 20,383,222. Of those who attended the public schools, 21.8 per cent were in the first grade, 13.8 in the second grade, and only 8.2 in the eighth grade. The statistics for the last few years of the decade 1914-24 showed that the public elementary schools were making it possible for pupils to progress more uniformly than previously. In 1911, the enrollment in the first grade had been 23.5 per cent of the total, and only 6.4 were in the eighth grade.

The average number of days that schools were in session in 1919-20 was 161.9. This is an increase of more than 17 days over 1900. The average number of days that each pupil attended in 1919-20 was 121.2; in 1900, 99. The average child therefore was in school 22 days more in 1920 than in 1900. The per cent of children 5 to 18 years of age enrolled in school in 1919-20 was 77.8. This was an increase of nearly 5.5 per cent since 1900. At-

tendance in 1920 was more general among children 11 years of age than among those of any other age. About 94 per cent of all children 11 years old were in school in 1920, against 63 per cent of those 6 years old. The revenue receipts were income from permanent funds and lands, \$26,486,735; local taxes and appropriations, \$758,896,451; State taxes and appropriations, \$134,278,753; and from all other sources, \$50,908,896; making a total revenue of \$970,570,835. The total expenditure per capita of population in 1920 was \$9.80. In 1910 the per capita expenditure was \$4.64; in 1900, \$2.84. The total expenditure per pupil in average attendance in 1920 was \$64.16. In 1910 it was \$33.26 and in 1900 \$20.21. The average total expenditure per day for each pupil attending in 1920 was \$.306. In 1910 it was \$.211, in 1900 \$.14. The average annual salary of teachers in 1920 was \$871. In 1910 it was \$485, and in 1900, \$325.

Attendance in Secondary Schools. During the school year 1919-20, 188,862 students were enrolled in public high schools and 184,153 in private high schools and academies; total, 2,371,015. There was also a total of 59,309 students enrolled in the preparatory departments of higher institutions. In 1920 over ten per cent of those who were enrolled in school were in the high school, while in 1900 only 3.3 per cent were in the high schools. The per cents in the various classes in high school were for the first year, 41.6; second year, 26.0; third year, 17.9, and fourth year, 14.5. These proportions between the four classes had remained almost constant from 1912.

Teachers in the Public Schools. The teachers in the public elementary schools in 1920 included 63,024 men and 513,222 women, a total of 576,246. It is estimated that the private schools employed as teachers 6322 men and 38,977 women, totaling 45,299. The public high schools employed 32,386 men and 69,572 women, totaling 101,958. The private high schools employed 5698 men and 9248 women, totaling 14,946.

Costs of Elementary and Secondary Schools. The expenditures for school sites, buildings, furniture, libraries and apparatus in 1920 was \$153,542,852. The salaries for superintendents, principals and teachers was \$613,404,578. For all other purposes the expenditure was \$269,203,779. This made a total of \$1,036,151,209.

American Education Week. From 1919 one week each year was designated as American Education Week. The President issued a proclamation which was printed in full or in part by practically every newspaper in the country. The purpose was to arouse and consolidate the sentiment of the American people on their responsibility toward the children. Evidence was collected by the United States Bureau of Education and the National Education Association indicating that more than 1,000,000 sermons and addresses were delivered on the various subjects suggested for consideration during the week. Clubs of all kinds made education a part of their programme. The American Legion furnished speakers at many civic meetings, and motion picture houses throughout the country gave active support to the movement. Extensive use was also made of the radio. One feature of Education Week was the invitation extended to parents to see the school in action. Thousands

of foreign-born parents thus had their first glimpse of the American schoolroom. In many cities evening sessions of the school were held so that parents might come directly from office or factory.

Educational Investigations and Surveys. During the period between 1914 and 1924 many educational investigations and surveys were conducted by States, cities, townships, and private institutions. The first to attract wide attention was conducted in the City of Baltimore in 1911. Before this, legislative bodies had from time to time examined the schools for the purpose of determining the effectiveness of legal provisions. The Baltimore Survey made use of investigators trained in the field of education. The report concerned itself with the evaluation of existing educational methods within the city and also attempted to suggest remedial measures. Later experience effected a vast improvement in the methods of investigation. Standards were set, and it became possible to rate many features of a school system in terms which could be verified. A list of investigations would be very lengthy. Their significance is indicated by the fact that such surveys were conducted in Vermont, Maryland, Delaware, Ohio, Kentucky, Indiana, and Texas. Other States investigated phases of their work. Among these were an investigation of rural schools in the State of New York; teacher-training in the State of Missouri; and higher education in Colorado. Among the cities surveyed were New York, Philadelphia, Baltimore, Cleveland, Salt Lake City, and Portland, Ore. Investigations were conducted by the Carnegie Foundation, the General Education Board, the United States Bureau of Education, and various other agencies. The staffs for such work consisted largely of staff members of teachers' colleges and normal schools.

The earlier surveys were almost invariably the outcome of dissatisfaction on the part of those interested in the schools. Results were not entirely desirable. Later investigations were concerned with the educational policies to be adopted by either State or city. The outcomes of some of them were remarkable. Business methods of boards of education were improved, school building programmes adopted, and more effective financial and educational methods for the conduct of the schools approved. One important outcome was a demand for more definite knowledge concerning the various elements of cost in the public school systems. Various subjects in the school had been enriched and new studies and departments added with no adequate knowledge of what these changes meant in the way of increased financial responsibilities. Cities added kindergartens and junior high schools to their elementary schools and regular high schools without knowing what these additions would cost. States had in some cases undertaken to guarantee to every one who was qualified an education beginning with the grades and ending with the college and university. The mounting costs of education caused school officials no end of anxiety. Each year saw increasing indebtedness, and in the later years it became more difficult to raise additional funds. Some cities had to resort to the expedient of paying current expenses by means of long term bonds.

School officials, facing these difficulties, found themselves without the detailed information necessary for an answer. In 1921 a group of

persons interested in educational research appointed a committee to draw up a plan and ask support for an educational finance inquiry. As an outcome of the work of this committee the American Council on Education received contributions from the Commonwealth Fund, the General Education Board, the Carnegie Corporation and the Milbank Memorial Fund. The Council then appointed an Educational Finance Inquiry Commission which was given full responsibility for the conduct of the inquiry and whose chairman was Prof. George D. Strayer of Teachers College, Columbia University. The commission was composed of prominent educators. This body employed a staff of investigators. The report of the commission is contained in fifteen volumes published by the Macmillan Company, New York City. It indicates that in the ten-year period ending in 1920 the total educational expenditures of the entire country nearly doubled for capital outlay, nearly trebled for interest, and increased about two and one-half times for current expenses. It was stated that in spite of its rapidly mounting cost, education was receiving a noticeably smaller proportion of total government expenses than formerly. Total government funds devoted to education decreased about one-third; national, about one-fourth, and State, about one-fifth. On the other hand, the total local educational expenditures increased about one-ninth. The report stated that educational expenditures for the country as a whole each year exceeded the educational revenues, leaving a deficit which was 3 per cent of these revenues in 1910, and 5 per cent in 1920. Large numbers of school districts were bonded for approximately the full value of their school property. The average ratio of such debt to school property, however, was well under 50 per cent, although rising rapidly.

In the State of New York the commission studied the costs of instruction in various subjects. The cost in a sample city will suffice to show the character of the work undertaken. In this city the English in grade one cost \$34.43; health instruction, \$4.52, and fine and practical arts, \$9.74. In grade four English cost \$20.48; arithmetic, \$8.90; social sciences, including history and geography, \$8.90; health education, \$6.59; and fine and practical arts, \$8.55. For the first six years the total cost of teaching English was \$158.08, while the total cost per pupil for all instruction in these six grades was \$349.04. The expenses for the seventh and eighth year increased the total expense to \$481.40. If the cost of instruction and supervision in the special subjects be added to the class room teaching, the total expense for the first six years is \$395.32, and for the eight years of the elementary course, \$570.67. The total cost per pupil of kindergartens in New York City was \$74.75; for the ungraded classes, \$133.40.

Illiteracy. No subject connected with education received more attention in the later years of the decade than that of illiteracy. It was first brought to the attention of the American people in a pronounced way by the illiteracy statistics for the army. These were much higher than the figures given in the 1910 census. The 1920 census showed an improvement of 1.7 per cent in the illiteracy situation. This, however, is not consoling when it is remembered that there were more than 5,500,000 persons in our population 10 years of age or over who

could neither read nor write. The census report showed that 1,242,572 native whites were illiterate. This was 2 per cent of the total native white population. Of the foreign-born whites 1,763,740 were illiterate, or 13 per cent of the total foreign-born white population. Of the Negroes, 1,842,161 were illiterate; this was 22.9 per cent of the total Negro population. In Texas 33.8 per cent of the foreign-born white population were illiterate, and of the Negro population in Louisiana 38.5 per cent. The illiterate population represented 6.0 per cent of the total 10 years of age and over in 1920, the corresponding percentages for the last four preceding census years being 7.7 in 1910, 10.7 in 1900, 13.3 in 1890, and 17.0 in 1880. Connecticut was the only State showing an increase in the proportion as well as the number of illiterates. Five States, Montana, Idaho, Wyoming, Utah, and Washington, and the District of Columbia had only three-tenths of 1 per cent illiteracy.

New Departures in Elementary Education. It would be difficult to predict the extent to which some of the innovations in elementary education will influence the schools of the future. Four changes in educational procedure in the decade 1914-24 seemed to have won a foothold.

Junior High Schools. Studies of school attendance beginning in 1907 called attention to the remarkable dropping off of students between the elementary and high school and in the first year of the high school. A study of the reasons for this led to the belief that the lack of coördination between the elementary school and the high school was largely responsible for this condition. Almost none of the subjects studied in the elementary school were continued in the high school. Between the two institutions was a sharp cleavage in organization as well as in teaching methods. The last year of the elementary school was largely devoted to a review of the work of the school. These and other considerations led school officials to formulate plans for the organization of a new element in the school system, which came to be known under various names, most commonly junior high school. This school usually cares for the children of the seventh, eighth and ninth elementary school years. The effort is made to have the courses of study include a wider range of subjects than under the other form of organization. This is for the purpose of giving boys and girls the opportunity to explore various fields and to determine their fitness for such work as will follow in the high school, which under this plan is known as the senior high school. The junior high school, or intermediate school as some prefer to call it, had fulfilled reasonable expectations. Increasing numbers of such schools were organized, and most cities were making provisions for them in their new building programme.

The Platoon School Organization. This form of school organization was designed to meet the newer conditions which exist especially in the larger cities. It was extensively employed in the schools of Detroit. Typical platoon schools have 20 to 28 sections or classes of 40 pupils each. The buildings provide a gymnasium, an auditorium, open air play rooms, special rooms for music, art, literature, science, and library, and "home rooms" which correspond to the usual class rooms. The standard school day is

six hours long, a three-hour session in the morning and a three-hour session in the afternoon. The usual morning session is from 8.30 to 11.30, and the afternoon session from 12.30 to 3.30. Some schools have a somewhat longer noon hour. With the exception of pupils of the first grade and those especially excused, all pupils remain in school six hours and are busy during this entire period. The school membership is divided into two groups or platoons. While one group is engaged in the "home room" or regular room, the other group is attending classes in the special rooms. Thus half of the pupils are in the "home rooms" at any given time and the other half are engaged in special activities. For "home room" activities the school day of 6 hours is divided into four periods of 90 minutes each. Each platoon has "home room" work for 90 minutes in the morning and 90 minutes in the afternoon.

For special room activities, the 6-hour day is divided into twelve 30-minute periods. Each platoon is engaged in special activities during 6 of these twelve 30-minute periods each day. Each pupil spends 90 minutes of the morning in the "home room" under the control of the "home room" teacher and the remaining 90 minutes of the morning in the special activities, 30 minutes in 3 separate special rooms. In the afternoon, he again spends 90 minutes in the "home room" and the remaining 90 minutes in 3 special rooms. The number of special room activities possible in a platoon school is determined by the number of classes or groups of pupils involved. If there are 20 classes, the school must house 800 pupils, or 400 in each platoon. This requires 10 "home rooms" to care for 400 pupils. The remaining 400 pupils may be provided for in special rooms. The cost of buildings for the platoon schools is somewhat greater per pupil in the 20-section schools and a little less in the 28-section schools than in the traditional schools. The capacity of the school building is increased by more than 40 per cent by the platoon organization. The per capita cost of instruction is about the same in both types of schools.

The Dalton Laboratory Plan. Following 1890 many efforts were made to provide individual instruction in the class room. Some of these plans were widely advertised and were introduced into various school systems. In 1924 scarcely an evidence existed of the earlier attempts. Greatest attention was given the Dalton Plan. The originator of this plan, so far as it applies to public school work, is Helen Parkhurst. It was first tried with a group of crippled children in 1919. The next year it was introduced in the Dalton, Mass., High School. Miss Parkhurst spent the summer of 1921 in England, where she conducted a model school according to the "Dalton Laboratory Plan," and her lectures were published. From that time Miss Parkhurst's plan received increasing attention throughout England, and a large number of the schools there were in 1924 organized in accordance with her ideals. In New York City Miss Parkhurst was conducting a school called the Children's University School. A large number of people visited this school. It was estimated in 1924 that several thousand schools of different sizes in the United States were organized according to the Dalton Plan, and various cities and communities were considering the advisability of adopting the organization.

Miss Parkhurst's book, *Education on the Dalton Plan*, had been translated into several languages, and she had been invited by various foreign countries to aid in the reorganization of some of their schools.

The Dalton Laboratory Plan may be applied in the high school and in the elementary school from the fourth grade up. For convenience the different parts of the curriculum are divided into major and minor subjects. The former group includes mathematics, history, science, English, geography, foreign languages, etc.; the latter, music, art, handiwork, domestic science, manual training, gymnastics, etc. Miss Parkhurst advises that the plan be introduced with major subjects first. Each subject is then divided into what would correspond to 20-day periods or jobs, and the pupil accepts the jobs assigned for his class for a month as a contract. Each child has in his possession a complete outline of the work which he will be required to do for four weeks. These outlines, made by the teachers, are explicit. The children are graded much as they would be in a regular public school and are always identified with forms or grades. At the opening of school in the fall the child receives the assignment or jobs that he is supposed to do in the next 20 school days, or 4 school weeks. Having accepted his contract, the child is free to approach his work in any way he may choose. No classes are taught as in the ordinary school procedure. A child may, for example, choose to do all of one subject during the first few days and to leave the other subjects untouched. He knows exactly how much he must do, and he knows at the end of each day of study how far he has progressed. He must complete the entire contract before he can receive other jobs, but he may receive the next contract whenever he has completed the jobs called for in the contract under consideration. If, therefore, he is able to accomplish the work planned for four weeks in three weeks he immediately goes to the next contract. If he cannot complete it in the four weeks he may have a longer time. In this way each child progresses at his own rate.

The different classes or forms meet occasionally, perhaps two or three times a week, for group conferences with their teachers. Aside from these group meetings the teachers deal with individuals, and the pupils call for help when they need it and are required to report on progress in accordance with their assignment. The rooms in which the teachers meet the children are called laboratories instead of class rooms. In the Children's University School is no such furniture as in an ordinary schoolroom. Since the children do not recite as an entire class, there is no need for a large number of seats or desks in a room. They come to the laboratory for the purpose of consulting the books there, or to consult with the teacher.

A system of charts or graphs designed by Miss Parkhurst makes it possible for the teacher as well as the child to know just where he stands. The teachers therefore are able to assist the children in properly apportioning their time. It is claimed that children very soon learn to apportion their time in the most effective way.

The Nursery School or Pre-kindergarten. During the later years of the period various changes had been taking place in the kindergarten. Froebel and his followers introduced

much that was symbolic in the ordinary kindergarten procedure. For a long time there was almost complete divorce between the kindergarten and the first grade. Later, however, the scientific study of the physical and mental development of young children brought about a change in the kindergarten. In the kindergarten itself greater attention is given to the exercise of the abilities which belong to children of that age and which are important in further school progress. Although reading and the other school subjects are not directly taught, the kindergarten child of to-day comes to the first grade better prepared to undertake these subjects than the child who has had no such training. A significant outcome of the study of young children was the formation of a new type of school called the Nursery or Pre-kindergarten School. In such schools children from two and a half years up are received and given such training and exercise as they require. These schools should not be confused with the institutions formed to take care of the young child in order that the mother may be permitted to work. The nursery school receives children from all kinds of homes, and its justification is its educational value. Elaborate researches were being made in several universities in 1924, and there were enough schools of this type to indicate their importance. How expensive such schools would be remained to be demonstrated. Expense seemed likely to handicap their development seriously in the public school system.

The Hershey Industrial School. Late in 1923 Mr. M. S. Hershey announced that he had turned over to the Hershey Industrial School five years before a fund amounting to approximately \$60,000,000. This placed the school next to Girard College in Philadelphia as the richest orphanage in the United States. The school was formally opened in 1910 in Hershey, Pa. Its enrollment in 1924 was 120. It was expected to have at least 1000 pupils in a few years. Mr. Hershey has restricted enrollment, first, to orphans of Dauphin, Lebanon, and Lancaster Counties; secondly, to those born elsewhere in Pennsylvania, and thirdly, to those from any part of the country. It is stated that an effort will be made to have the life of the children as homelike as possible. Each child is allowed to select his own trade. The aim is to make each one self-supporting.

Measurements in Education. In recent years there has been marked progress in the measurement of educational achievement. As long as there was a belief in faculty psychology definite measurements were not essential. A child might, for example, have great difficulty with arithmetic and as a consequence make very little progress in this subject; the earlier conception of psychology justified the belief that this child was gaining from his studies in other ways than measurable progress in arithmetic. Consequently, the more disagreeable and the more difficult the subject might be, the greater would be the benefit that would come from the study. The newer psychology at first denied the existence of transfer in training. Whatever results were obtained in the study of arithmetic, according to this theory, would be measured in the arithmetic itself. The prevailing notion at present is that there will be a transfer of training in so far as the situations under consideration are similar. It is therefore desirable to measure the amount of improvement in

any given subject. A large number of scales or standards were developed for the purpose of measuring achievement in school subjects. In general the instruments of measurement may be divided into two groups. In one group may be found the examinations or tests that have been given to a great number of school children scattered throughout the country. From the results of these examinations the tests have been standardized, usually by determining what the median or average child is able to do in the test. Certain tests in arithmetic and spelling may be considered as typical of this group. In other subjects where the quality of the result is important the standards were developed by obtaining the judgment of a large number of competent individuals on various samples of work. Such samples, when properly arranged and evaluated, become the scale or standard by which others may be ranked. English composition, penmanship and drawing are fields in which such scales or standards were developed. Scales and standards of the types indicated came into very general use in the public schools of the country. To a large extent they took the place of the examinations formerly set by some central office. They served for determining the promotion of children, and later were used in connection with other measurements to determine the efficiency of the teaching. Considerable attention was being given to tests that would locate a student's particular difficulty. Most of these were in the field of arithmetic.

The Federal Education Bill. An educational bill was before Congress in 1924. This bill was similar to those under consideration for several years preceding. It provided for a cabinet member for education, and for an appropriation of \$100,000,000 to be expended by the different States in improving educational facilities. The bill was being supported by more than 20 national organizations.

Vocational Education. Vocational education continued to receive much attention. The enthusiasm which earlier led cities to vote large sums of money for vocational education, when they did not know what form this training should take, no longer existed. It may be doubted whether the appeals which won Federal acts in relationship to vocational education would have been effective in 1924. Still, a large number of carefully planned and scientifically conducted experiments and investigations were being carried on in the United States in the field of vocational education. The War and the experiences which came with the training of disabled veterans cast doubt on the possibility of general vocational training. At the same time the efficiency of specific training was pretty thoroughly demonstrated. In the course of several months of intensified training men had been able to secure a better grasp of the trades than was possible in a much longer period of unspecialized work. Two Federal acts had pronounced influence on vocational education in America. The first of these, known as the Smith-Lever Act, became operative in 1914. This law provided for coöperative agricultural extension work, instruction and practical demonstration in agriculture and home economics for persons not attending or resident in the agricultural colleges. The appropriations provided by this act go to the State agricultural colleges which are required to make plans for the work subject to the approval of the Secre-

tary of Agriculture. The general plan for conducting this work consists in first locating extension agents in several counties of the State to carry on demonstrations, advise the farmers and stimulate them to better work; secondly, the organization of boys' and girls' clubs, largely in connection with rural schools, to conduct some simple agricultural home economics project; thirdly, the organization of a staff of specialists in agriculture and home economics as a part of the faculty of agricultural colleges. These specialists go about the State and assist the extension agents. This law provides \$10,000 annually for each State for its agricultural college. In addition there was available in 1924 an annual appropriation of \$4,100,000 which must be met with an equal appropriation from the States. The Federal funds are allotted to the various States according to the proportion which the rural population of each State bears to the total rural population of the United States. Both the fund received from the Federal government and the equal fund from the State government to balance it must be expended on extension schemes approved by the United States Department of Agriculture.

A second important Federal act relating to vocational education was the establishment of the Federal Board of Vocational Education in 1917. This board was to cooperate with State boards in case the State adopted the provisions of the act. The act provided for aid for salaries of teachers in vocational subjects, the amount to be met by the State; Federal supervision of work and expenditures, and investigations to be conducted by the Board in the several fields of vocational education. The amount of Federal funds available for each of the specified purposes was to vary until the school year 1925-26. From that time on, the amount available for agricultural education would be \$3,027,000; for trade, household economics and industrial education, \$3,050,000; for teacher-training, \$90,000; for investigation, \$200,000. In 1918, 1741 schools with a total of 164,186 students qualified for Federal aid under the Smith-Hughes Act. In 1923 the number of schools had increased to 5700; the students, to 536,528. In 1923, 2673 agricultural schools had 71,298 students; 1634 trade or industrial schools had 325,889 students, and 1393 home economics schools had 139,341. Pupils in vocational teacher-training institutions numbered 20,738. The acceptance of the provisions of the Smith-Hughes Act required legislative action on the part of the different States. This apparently stimulated the States to further action, particularly in reference to continuation education.

Continuation Education. Continuation education was compulsory in several States in 1924. The period during which persons must attend these schools or classes varied. In some States the law operated between the ages of 14 and 16 and in others between the ages of 16 and 18; in still others it is effective between the ages of 14 and 18. Where these schools are established, employed minors within the ages specified, who have not finished 4 years of secondary school work, are usually required to attend 8 hours a week for 36 weeks each year. Such classes are held not less than 4 nor more than 8 hours a week. These part-time continuation classes have to a large measure taken the place of evening schools.

Teacher Training. The report of the United

States Commissioner of Education for 1919-20 showed that the enrollment in the normal schools and teachers' colleges included 19,110 men and 116,308 women, totaling 135,418. The graduates from these institutions in 1920 were 2151 men and 18,861 women, a total of 21,012 qualified to teach. The total receipts for the 371 institutions reporting was \$31,345,389. Prior to 1920 few teacher training institutions had more than a two-year course, and such institutions as gave degrees on the completion of four years' work were usually connected with universities. In 1924 several normal schools had been or were being converted into teachers' colleges with courses of study of three and in some cases four years. The normal schools of New York State had three-year courses, and it was proposed to make them four-year courses at the earliest opportunity. The same condition obtained in some of the other States, notably California and Missouri. Several others, including Massachusetts, Louisiana, Pennsylvania, and Texas, were conducting extensive inquiries into the workings of their teacher training institutions. A Committee on Standards of the American Council on Education defines the normal school or teachers' college as "an institution of higher education with two-year, three-year and four-year curricula designed to afford such general and technical education as will fit students to teach in elementary and secondary schools." The committee suggests the following standards for teacher training institutions:

1. The requirement for admission should be the satisfactory completion of a four-year course of study in a secondary school approved by a recognized accrediting agency, or the equivalent of such a course of study.

2. The requirement for a diploma should be the satisfactory completion of at least 60 semester hours, and the requirement for graduation with the baccalaureate degree the satisfactory completion of at least 120 semester hours.

3. Each course of study leading to a diploma or degree should be recognized separately and only if the following conditions are met: (a) Two-year courses of study leading to diplomas should have a minimum enrollment of 80 students fully matriculated according to the provisions of standard 1 above; (b) Four-year courses of study leading to baccalaureate degrees should have a minimum enrollment of 100 students fully matriculated according to the provisions of standard 1 above, exclusive of any other students.

4. The faculty of a normal school or teachers' college should consist of at least eight heads of departments devoting full time to the work of the institution. With the growth of the student body the number of full-time teachers should be increased so as to preserve a ratio of teachers to students of approximately 1 to 12, exclusive of teachers giving full time to elementary and secondary instruction in training departments.

Teaching schedules exceeding 16 hours per week per instructor, or classes (exclusive of lectures) of more than 30 students, should be interpreted as endangering educational efficiency.

The Visiting Teacher. In every school system may be found children who do not make satisfactory progress. They are not truants, because the well organized attendance divisions assure their presence in the school rooms;

neither are they delinquents or defectives. They are the victims of some type of maladjustment in the school system or home. To meet the needs of children who are misfits, some schools were employing persons with the title of visiting teachers or home and school visitors. A visiting teacher locates the difficulties that may exist and then attempts to adjust conditions so as to enable the child to make more profitable use of the school. She coordinates the efforts of the school, the home, and various independent agencies such as social settlements, civic organizations, parent-teachers' associations and others of similar character.

The first visiting teachers, or home and school visitors as they are sometimes called, were employed during the school year 1906-07 in Boston, New York, and Hartford. In each place the movement was supported by private funds. In 1924 at least 28 cities in 15 States had visiting teachers. The cities finally assumed responsibility for the support and control of the work. California was the only State in 1924 providing for home and school visitors. The Home Teacher Act in that State makes it "permissible for boards of education to employ a home teacher for every 500 units of average daily attendance." A national organization called the National Association of Visiting Teachers and Home and School Visitors had headquarters in New York City.

American Council on Education. The American Council on Education was the central organization in which the greatest national educational associations were represented. Its general object was to promote and carry out cooperative action in matters of common interest to the associations and to the institutions composing them. It has three classes of members, constituent, associate, and institutional. The constituent members are 16 national educational associations. Each is represented by three delegates who vote as a unit at meetings of the council through a designated person. Associate members are educational or scientific organizations having interests related to the work of the council. Associate members may send one representative each to the meetings of the council without the right to vote. Institutional members are colleges, universities, and professional and technical schools contributing not less than \$100 a year to the treasury of the council. Each may be represented at meetings of the council by one delegate without the right to vote. In February, 1921, it had 16 constituent members, 12 associate, and 122 institutional. The budget for 1922 provided for the expenditure of \$27,117.61. Among the projects receiving attention from the various committees of the council were Federal legislation, international educational relations, education for citizenship, the training of women for public service, colleges of liberal arts, and standardization. The council was instrumental in bringing about an investigation of the cost of education and of public resources available to support it. Headquarters are in Washington, D. C.

Carnegie Foundation for the Advancement of Teaching. A summary of the seventeenth annual report of the president of the Carnegie Foundation for the year ending June 30, 1923, states that during the 17 years of its existence the Carnegie Foundation distributed \$9,939,676 in retiring allowances and pensions to 1020 persons. Of this sum \$787,000 was paid to

former teachers of Harvard University, \$677,000 to former teachers of Yale, \$592,000 to former teachers of Columbia, and \$460,000 to former teachers of Cornell Universities. The remainder went to 85 different institutions. There were then operative 396 retiring allowances and 246 widows' pensions, 63 of them granted during the preceding year, entailing an annual expenditure of \$1,022,790. The average allowance paid was \$1593. The maximum allowance had been fixed at \$3600. The total resources of the Carnegie Foundation amounted to \$26,376,000, of which \$15,192,000 belonged to the permanent general endowment, \$8,914,000 to a reserve fund to be spent in the retirement, during the next 60 years, of teachers in associated institutions, \$1,277,000 to the endowment of the Division of Educational Inquiry, and \$628,000 to a reserve fund to be expended in aiding universities and colleges to adopt the new plan of contractual annuities. The Teachers' Insurance and Annuity Association of America, which was established by the Foundation through a gift of \$1,000,000 to provide insurance and annuity protection for college teachers without overhead charges, had written for teachers in 355 different institutions 1519 insurance policies covering \$7,928,000 of insurance and 1175 annuity contracts providing \$1,496,000 annual income at retirement.

The General Education Board. The General Education Board was incorporated by Act of Congress, Jan. 12, 1903. The charter stated that the general object of the corporation is "the promotion of education in the United States of America, without distinction of race, sex, or creed." The funds of the institution were derived from the benefactions of John D. Rockefeller. The report for the year ending June 30, 1923, showed assets amounting to \$128,667,091.53. The income for the year was \$15,899,897.42, and the disbursements were \$6,659,672.94.

From the Board's foundation to June 30, 1923, was appropriated for various educational purposes a total of \$106,214,284.38. Of this amount \$56,517,617.39 had been paid. This left nearly \$50,000,000 appropriated but unpaid. In making payments thus far the Board had used \$12,234,785.24 from its principal funds and \$44,282,832.15 from income. In December, 1919, Mr. Rockefeller gave \$50,000,000 to the Board, "the principal and income of which might, at the discretion of the Board, be used for the increase of teachers' salaries." The report states that "the appropriations during the last four years for the purpose of increasing teachers' salaries have practically exhausted the gift in question." Exclusive of appropriations to schools of education and medicine, the Board had appropriated to general college and university endowments in 291 institutions a total of \$57,662,493.50 from its establishment to July 1, 1923. When the institutions met the conditions under which these appropriations were made, more than \$200,000,000 was to be added to the funds of the institutions concerned. The report indicated a change in the policy of the Board. It stated that "during the last two years the Board has gradually come to the conviction that its possibilities of usefulness in this direction (increasing endowments of colleges) are drawing to an end. The financial resources of higher institutions have been greatly augmented. Internal prob-

lems affecting organization, administration, and instruction have arisen. It would therefore seem to be opportune for the Board to devote its attention to other phases of education."

Institute of International Education. This institute was established in February, 1919, by the Carnegie Endowment for International Peace. As stated by one of its directors, the general aim is to develop international goodwill by means of educational agencies and to act as a clearing house of information and advice for Americans concerning things educational in foreign countries and for foreigners concerning things educational in the United States. The institute pays the traveling expenses of professors on sabbatical leave who are willing to lecture in foreign universities and have been invited to do so. The institute also entertains distinguished visitors and commissions on their arrival in the United States.

Rhodes Scholars. The system of Rhodes scholarships was founded by the will of Cecil John Rhodes. Provision was made for supporting at Oxford University, for a period of three years each, about 176 selected scholars. The United States is entitled to send two students from each State. Candidates must be between 19 and 25 years of age and have completed at least two years of college work. The will outlines the bases of selection as scholarship, character, interest in out-of-door sports, interest in one's fellows, and capacity for leadership. During 1921, 407 American college and university men were applicants for appointment. Thirty-two were appointed.

The Alumni Association of the Rhodes Scholars completed a survey of the work of the American Rhodes Scholars in attendance from 1904 to 1914. The report showed that 351 men were appointed during this period. The occupations of 301 of these are classified as education, 114; law, 72; business, 38; social and religious work, 23; government service, 15; graduate students, 10; scientific work, 10; literary and editorial, 8; medical, 7, and miscellaneous, 4.

The American Oxonian, the official magazine of the Alumni Association, presented a statistical study of the records of the scholars compiled by Prof. R. W. Burgess of Brown University. More than 500 American Rhodes Scholars had been appointed. They represented 172 American universities and colleges, only 39 of which had been represented by as many as 5 scholars. Only 14 per cent of the scholars had had less than a full college course; 19 per cent had done graduate work. "Americans succeed best at Oxford in those subjects of study which are not based on previous preparation, while the record of English students is exactly the other way." The record of the American Rhodes Scholars was particularly good in competition for the degree of Doctor of Philosophy and in law. Most of the Ph.D.'s awarded at Oxford had been given to American Rhodes Scholars, and of the seven Firsts in Jurisprudence awarded in the entire university in 1923, five were taken by American Rhodes Scholars.

Scholarships under La Verne Noyes Foundation. The will of La Verne Noyes provided that the income from his estate should be used for educating men who served in the United States army and navy, or their descendants. The trustees of the foundation made allotments for 30 scholarships for nurses who served with the army or navy of the United

States. They also announced the allotment of 230 other scholarships to be distributed among 22 universities and colleges during 1923-24. Another 100 scholarships were to go to Northwestern University and 40 to Lewis Institute in Chicago. The total was 400 scholarships. It was announced that ex-service men and women desiring to avail themselves of these scholarships should make application to the college or university of their choice.

University Centre of Research in Washington. According to the articles of organization, "the purpose of the University Centre of Research in Washington, D. C., shall be to promote and facilitate research in archives, libraries, and other collections located in the District of Columbia on the part of students in the graduate departments of American and foreign universities and of others." The activities of the University Centre were limited to history, political science, economics and statistics, and international law and diplomacy, up to 1924. It was expected that there would later be opportunity for investigators in all fields of learning. The University Centre is not an institution in the ordinary sense of the word. It is rather an organization for the purpose of rendering aid, especially information on the location of desired material, to investigators in certain fields. It makes no charge for its services. See also LAW, PROGRESS OF, *Reformation in Legal Education*.

EDWARD, (ALBERT CHRISTIAN GEORGE ANDREW PATRICK DAVID), PRINCE OF WALES (1894-). The eldest son of King George V and Queen Mary of England, born at White Lodge, Richmond Park. The Prince began to prepare for the navy when he was eight years old; in 1907, entered Osborne and in 1909 the Royal Naval College at Dartmouth. Upon becoming a midshipman, the Prince was appointed to H.M.S. *Hindustan*. In October of 1912, he entered Magdalen College, Oxford, as a freshman, but his university career was cut short by the outbreak of the War and on Aug. 7, 1914, he was gazetted a 2d lieutenant in the Grenadiers Guards and shortly afterward joined the 1st battalion at Warley Barracks, Essex. During the War he served as aide-de-camp to Sir John French, with the Expeditionary Force in Flanders and in France, later with the Mediterranean Expeditionary Force in Egypt and subsequently on the Italian front. At the time of the Armistice he was serving with the Canadian Corps, and in the early part of 1919 became attached to the Australian Corps in Belgium. The Prince visited Canada and the United States in 1919, on the H.M.S. *Renown*, and in the next year went to New Zealand and Australia by way of the Panama Canal. Upon his arrival in England in October, 1920, he was given a magnificent reception and a banquet at Buckingham Palace. Just a year later, he made a visit to India on the *Renown* and in 1923, another hasty visit incognito to his ranch in Canada.

Since birth, the Prince has been the object of the preparation and enthusiasm that befitted one some day to be the monarch of the British Empire. His career has been characterized by its democratic simplicity, all the more enhanced perhaps by the charming personality of the Prince himself, which has made him the cynosure of admiration not only at home but abroad.

EDWARDS, ALFRED GEORGE (1848-). An English clergyman, the first Archbishop of Wales, born at Llanymawddwy, and educated at Jesus College, Oxford. He was ordained curate of Llandinog, Carmarthen, in 1874, becoming headmaster of the college, Landover, a year later. He became vicar and rural dean of Carmarthen in 1885, bishop of St. Asaph in 1889, and in 1920, after the disestablishment of the Welsh Church, was created Archbishop of Wales. His publications include: *The Church in Wales* (1888), *Common-Sense Patriotism* (1894), and *Landmarks in Welsh Church History* (1912).

EDWARDS, CLARENCE RANSOM (1850-). An American soldier, born at Cleveland, Ohio. He was graduated at the United States Military Academy in 1883, and entered the United States Army as second lieutenant in the 23d Infantry. By successive promotions, he attained the rank of major-general and was retired in that grade in December, 1922, after 40 years of service. He participated in the campaigns in the Philippines, serving as adjutant-general on General T. W. Lawton's staff in 1899. In 1902, he was made chief of the Bureau of Insular Affairs, on account of his intimate acquaintance with conditions in outlying possessions. He retained this office until 1912, when he returned to the line and during 1915-17 was in command of the United States troops in the Panama Canal Zone. Later, he had charge of the Department of the Northeast, where he organized in 1917 the 20th Division; he was in France during 1917-18 serving on front line duty. On his return to the United States, he was assigned to the command of the First Corps area with headquarters in Boston. He was given the Croix de Guerre with palm and made an officer of the Legion of Honor.

EELS, BREEDING PLACE OF. See FISHERIES.

EGAN, MAURICE FRANCIS (1852-1924). An American scholar and diplomat (see VOL. VII). From 1907 until 1918, he was United States Ambassador to Denmark. In addition to publishing *The Ivy Hedge* (1914), and *Ten Years on the German Frontier* (1919), he has been a prolific contributor to *Century*, *Atlantic Monthly*, *Yale Review*, etc.

EGERTON, HUGH EDWARD (1855-1927). An English historian (see VOL. VII). He published *British Foreign Policy in Europe* (1917), and *British Colonial Policy in the 20th Century* (1922).

EGYPT. A kingdom in northeastern Africa since Feb. 28, 1922, when the British protectorate terminated. The total area of Egypt proper, including the Libyan Desert, the region between the Nile and the Red Sea, and the Sinai peninsula, is about 350,000 square miles: but the cultivated and settled area, i.e. the Nile Valley and Delta, is but 12,226 square miles. The population for this section was, by the 1917 census, 12,750,918; this made a density of 1061 per square mile, an increase of 12.6 per cent over the last decennial census. The increase for 1897-1907 was 14.9 per cent. The estimated population in 1922 was 13,551,000. The largest towns had the following populations in 1917: Cairo, 790,939 (654,476 in 1907); Alexandria, 444,617 (332,246 in 1907); Port Said, 75,192 (49,884 in 1907); Suez, 30,996; Tanta, 74,195; Mansura, 49,238; Zagazig, 41,741; Asyut, 51,431. The 1917 census showed 11,623,753 Moslems, 856,670 Orthodox Christians (Copts),

47,465 Protestants, 107,531 Roman Catholics, and 59,581 Jews. The country had 238,661 foreigners and 452,263 nomads. Of Moslems, 947 per 1000 were illiterate in 1917; Orthodox Christians, 829; Catholics and Protestants, 531; Jews, 562, and others, 934; total, 921. Education made no advance in the period 1914-22. The total of native and foreign schools was reduced from 8720 to 6501. The native elementary schools, called "Maktabs," for the most part under the control of the provincial councils, decreased from 7590 to 5463. The total number of students was 537,270 and 511,671 respectively. Although the total of male students diminished, the number of female students increased almost 24 per cent. The total number of girls was 79,573 at the beginning and 99,402 at the end of the period. Egyptian schools in 1921-22 numbered 6175, of which there were only 232 schools for girls. Egypt had, besides "Maktabs," colleges of medicine, law, engineering, and agriculture, a military institution, special technical schools, secondary schools, higher primary schools, etc. Besides native schools, there were British, American, French, Greek, Italian, and other foreign schools. Much of the native agitation against British rule crystallized about the failure of the British to increase the facilities for education. After 40 years of British domination, it was pointed out, 92 per cent of the men and 99 per cent of the women were still illiterate. The British policy had been directed almost exclusively toward the furtherance of secondary education, and even here the equipment was inadequate. Because of the failure to found a state university, the natives sought instruction at the university of El-Azhar (Cairo), the chief centre of Moslem orthodoxy, and the anti-occidental spirit which resulted was inevitable. The education charge in the budget remained low constantly, the proportion in 1922-23 being only 3.8 per cent of the total expenditure.

Agriculture. In 1920-21, the cultivable area of Egypt was reckoned at 8,129,055 feddans (1 feddan = 1.038 acres), of which 2,774,686 were uncultivated. About 37 per cent of the population was engaged on the land. The cultivation of cotton was the most important single activity; 1,465,136 feddans were sown with it, in 1922, as compared with 1,723,094 in 1912. The yield in 1922-23 was 578,682,000 pounds. The government frequently had to take measures to restrict the acreage because of the neglect of food crops. For the years 1921-23, for example, only one-third of each holding could be planted in cotton. In 1921-22 1,462,221 feddans under wheat yielded 40,643,000 bushels, compared with a yield of 35,731,000 bushels in 1913-14; barley, 361,231 feddans and 11,985,000 bushels (12,050,000 bushels in 1913-14); maize, 2,027,000 feddans; and millet, 259,490 feddans. Thus the food crops steadily declined in the face of the growing cotton culture. In 1921-22, 62,608 feddans were under sugar cane, as compared with 50,029 in 1912. In 1913 the sugar export amounted to 5,133 metric tons, valued at £79,068, and this increased in 1923 to 37,550 metric tons, valued at £1,057,767. In 1913, 690,644,548 pounds of raw cotton, valued at \$127,310,414, were exported; in 1923, 740,162,120 pounds valued at \$232,231,771. To supplement the Assuan dam for the reclaiming of waste areas, a large irrigation project was announced in 1920. This was to include a dam at

Gebel Aulia, near Khartum, with a storage capacity of 2,000,000,000 cubic meters, or twice that of Assuan, for the service of at least 2,000,000 acres of waste land.

Mining and Manufacturing. Principal mineral products in 1921 were, in metric tons, phosphate rock, 122,024; manganese iron ore, 55,065; petroleum, 178,284. The increase in the last was particularly marked, for up to 1912 petroleum was hardly produced at all. In 1913 the output was only 12,700 tons. The manufacture of cigarettes, the leading industrial activity, visibly declined after 1913. In 1923 the amount of tobacco imported for the making of Egyptian cigarettes was 6,667,715 kilos; this was more than 1,500,000 kilos below the 1913 figure. In 1913, 493,716 kilos of cigarettes were exported; in 1923, only 187,914 kilos. Imports from China became important during the War.

Trade. For 1913, imports were \$139,047,323; 1920, \$382,033,600; 1921, \$219,256,537; 1922, \$196,736,078; 1923, \$212,348,853. Exports for 1913 were \$157,993,704; 1920, \$320,501,479; 1921, \$143,606,445; 1922, \$221,172,538; 1923, \$273,836,564. The year 1922 was the first to show a normal condition since 1913 and a favorable trade balance was restored. In both 1920 and 1921 there were heavy adverse trade balances, but for 1922 the foreign trade showed a favorable surplus of \$24,436,460; in 1923, \$61,487,711. In 1913 this had been about \$19,000,000. Cotton continued in the place of leading prominence, its exports totaling 90 per cent of the entire export trade. Next in importance were cottonseed, refined sugar, cottonseed cake, cigarettes, onions, eggs, etc. Leading imports in 1923 were cotton and cotton textiles (\$77,490,581); metal, metal goods, and machinery (\$25,126,267); wheat and wheat flour (\$9,966,302), coal (\$7,616,438), tobacco (\$5,949,082), building materials (\$7,857,279). The fluctuations in flour imports showed something of the part cotton played in Egyptian economic life. Imports for 1913 were \$10,000,000; 1920, \$24,000,000; 1921, \$25,000,000; 1922, \$8,000,000; 1923, \$10,000,000. The restrictions on cotton-planting, begun in 1921, account for the smallness of the 1922 figure. In 1913 Great Britain was the leading country of origin of Egyptian imports; it sent 30.5 per cent of the whole. The United States ranked ninth with 1.9 per cent. In 1922, the proportions were: Great Britain, 34 per cent; United States, 3.8 per cent. In 1923 the percentages were 33 and 3.7, respectively. The last two figures for the United States were a distinct falling off from the 1920 and 1921 proportions of 10.6 and 15.1. Proportions by countries of destination of Egyptian exports were, for 1913, Great Britain, 43.1 per cent, and the United States, 7.8 per cent; for 1923, Great Britain, 48 per cent, and the United States, 12.4 per cent. In 1919 and 1920, the United States proportions were 22 and 30 per cent. The American purchases of raw cotton were significant. In 1913, 66,712,453 pounds (\$12,188,240) were purchased; in 1923, 106,871,384 pounds (\$33,357,798). Transit trade totaled \$18,462,978 in 1923 and \$10,342,144 in 1913. Reexports were \$6,878,635 in 1923 and \$2,885,473 in 1913. Alexandria handled 90 per cent of the total trade in 1913 and 90 per cent in 1923. Port Said and Suez handled 8.4 per cent in 1913 and 8.2 per cent in 1923. In the conversions in this list, the following rates of ex-

change, based on the average annual fluctuations, were employed: 1913, Egyptian £ = \$4.99 or normal value; 1920, £ = \$3.75; 1921, £ = \$3.95; 1922, £ = \$4.54; 1923, £ = \$4.69.

Communications. No important railroad construction was accomplished during the period 1914-24 except the continuation of the line from Salhia to Quantara, which joined with the line across the Sinai peninsula to Jerusalem by a bridge over the Suez Canal. The bridge was removed in 1921 because it obstructed the Canal traffic. In 1924 a railway 217 miles long was begun, from Kassala to Port Sudan. Total mileage on Mar. 31, 1922, of state-owned railways (single and double track) was 2319 miles. In 1919 a Ministry of Communications took over control of all railway, telephone, telegraph, post-office, ports, and lighting facilities. Cairo and Assuit had wireless stations, and an air station was located at Cairo.

Finance. In 1912 revenues were placed at £E15,900,000, and expenditures at £E15,400,000. During the War, deficits were evident for the first time in the country's financing, the 1914-15 preliminary budget showing an adverse balance of £E1,460,000. The fall in prices during the year, left the very large deficit of £E15,600,000. In 1921-22, the accounts had been restored to their normal relationship, with an expenditure of £E37,747,000 and a revenue of £E41,803,000. For the fiscal year 1923-24, the budget estimates were £E34,905,000 revenues and £E34,355,000 expenditures. The reserve fund in 1923 amounted to £E2,190,000. In 1922 the amount of the public debt was £E92,761,540. The 1923-24 budget carried £E4,616,509 for debt service. The National Bank, the bank of issue, had in circulation in January, 1924, notes to the value of £E33,326,000. The gold reserve in January, 1924, was £E3,340,000.

Economic Conditions. The break in the cotton market in 1914 was only temporary, for the quick recovery of 1915, due to increased war demands, ushered in a five-year period of unprecedented prosperity. Cotton prices by 1920 were 10 times as high as those of the last pre-war period, with the result that it was possible for traders to invest great sums in foreign securities out of their profits. The peasants (fellahin) suffered because of the neglect of food crops, and the cost of living in the high year 1920 trebled the figures of 1914. The increase in the cost of living may be illustrated by the following 1914 and 1919 prices: mutton, per oke, from \$.50 to \$1.50; veal, \$.40 to \$1.00; butter, \$.50 to \$2.50; frying oil, \$.25 to \$.2. The government was compelled to purchase wheat abroad for sale at home at nominal prices, and subsidies to meet the increased cost of living began to play an important part in the budget. This figure was £E2,500,000 in 1922-23. The fall in cotton prices in 1921 brought real suffering. Labor agitations increased and strikes were frequent, particularly among dock laborers and street railway employees. Index of cost of living, based on the figure of 100 for 1914, was, for 1921, 180; 1922, 147; 1923, 133; February, 1924, 135.

History. On Dec. 18, 1914, the empty suzerainty of Turkey was factually terminated when the British Foreign Office declared Egypt a British protectorate. On the following day the reigning khedive, Abbas Hilmi, was deposed, and his uncle Hussein Kamil was set on the throne with the title Sultan of Egypt. The British

rule thus inaugurated did not terminate until Feb. 22, 1922. Martial law was at once declared, and the meeting of the Legislative Assembly was postponed. Under the high commissionerships of Sir H. McMahon (1915-16), who succeeded Lord Kitchener, and Sir R. Wingate (1916-19), Egypt was put on a war footing. By 1915 some 40,000 British troops had arrived in the country. The problems of the government increased in difficulty in the face of strong pro-German and pro-Turkish agitation and newly roused nationalistic aspirations. The growth of a powerful British bureaucracy which seemed to eliminate all hope of real native participation in the government, and the failure of the Legislative Assembly to convene, were particularly responsible for increasing the impatience of the educated Egyptian. Other equally serious grounds of complaint against British rule were the cruel treatment of native soldiers, the censorship of opinion, the suppression of native newspapers of the free movement suspected of nationalistic sympathies, and of political discussion in the state schools; and finally, the heavy requisitions of animals and produce imposed on the fellahin during the War. The democratic hopes held out by the Allies induced a section of the more moderate Nationalists to hope for a favorable hearing at the British Foreign Office, and two of their leaders, Zaghlul Pasha and Adli Pasha Yeghen, repeatedly made efforts to present their case. The refusal of the British to entertain these appeals and the subsequent deportation of Zaghlul Pasha on Mar. 9, 1919, to Malta, at the order of the puppet Sultan, Ahmed Fuad (1917-), poured oil on the flames with the result that the ensuing disturbances took on serious proportions. Participation was universal, the fellahin, much to the surprise of the British, joining with the educated classes in the disorders, and the Copts taking sides with the Mussulmans. Riots broke out at Cairo and Tanta in March, 1919, and British soldiers, firing into the mobs, killed many. Railway lines were torn up, and Cairo was isolated as a result of the cutting of telegraph wires; Alexandria was the scene of popular disturbances; a British detachment was besieged by fellahin in Assuit; the Arabs were breaking in from the west. Lord Allenby, appointed as special high commissioner in March, 1919, vainly attempted pacification but was met by a strike of officials at Cairo, again with a result of bloodshed. Zaghlul Pasha, now a popular hero, was permitted to return from Malta, but the political strike continued, and transportation was broken off. In April, 1919, Rushdi Pasha was invited to form a government once more, but after two weeks his ministry, unable to handle the situation, resigned. Meanwhile Zaghlul had repaired to Paris to place his country's case before the Peace Conference. But he was never given a hearing, for President Wilson, on behalf of the United States, had recognized the British Protectorate within a short time of his arrival. In December, 1919, a British mission, headed by Lord Milner, finally arrived in Egypt, only to be boycotted universally. Disorder prevailed, and the heads of El-Azhar university threw the weight of their influence on the Nationalist side. After four months the mission returned to England to take up its discussion with Zaghlul and the other members of the Egyptian delegation at Paris. The result of these meetings was the

so-called Milner-Zaghlul Agreement. Its most important points were the recognition of Egypt by Great Britain as a constitutional monarchy with representative institutions, and a guarantee to Great Britain of special rights made necessary by her interests in Egypt, including the right to defend Egyptian territory, to maintain a military force on Egyptian soil, to name a British financial adviser to supervise the debt service and a judicial adviser in the Ministry of Justice. Others provided for the calling of a constituent assembly, the creation of a legislature with ministerial responsibility, religious toleration, and protection of the rights of foreigners. The problem of the Sudan remained unsolved. The agreement was unfavorably received by the Egyptian Nationalists, who took umbrage at the provisions made for the financial and judicial advisers, the maintenance of a British military force, and the failure of the mission to specify directly that the protectorate was ended. The Milner report was submitted to the British Parliament on Feb. 18, 1921. Meanwhile a new Egyptian ministry, headed by Adli Pasha, proceeded to the selection of a delegation to treat with Great Britain concerning a new understanding. Zaghlul Pasha refused to serve on this delegation except on the acceptance of certain preliminary conditions, the abolition of martial law, the independence of Egypt as the basis of the negotiations, and the appointment of the majority of the delegates by the Egyptian people. These conditions were refused, and Zaghlul took a hostile attitude toward the new government; in this he was supported by most of the Nationalists, who sought the calling of the Legislative Assembly for the purpose of carrying on the negotiations. Riots again took place in Cairo and Alexandria in May, 1921, with the result that the British suppressed Nationalist newspapers and arrested agitators. In Alexandria, in particular, the casualties were heavy; Greeks, among the foreign population, suffered severely. The Egyptian delegation, headed by Adli Pasha, remained in London from August to November, 1921, but the discussions ended in no tangible results, partly because of the Egyptian refusal to tolerate a British military force and partly because Winston Churchill, who had succeeded Lord Milner as Secretary of the Colonies, was less willing to recognize the necessity for self government. The winter of 1921 saw a renewal of disorders. The arrest and removal of Zaghlul Pasha and 56 followers, first to Suez and then to the Seychelles Islands, whence Zaghlul was later transferred to Gibraltar before his release on Mar. 30, 1923, was followed by street fighting and another political strike on the part of government officials, together with the adoption of a policy of passive resistance, on Jan. 23, 1922. The seeming impasse and the visit of Lord Allenby to England to counsel the termination of the protectorate forced the hand of the British government, with the result that in February, 1922, Lloyd George made a unilateral declaration incorporating the termination of the protectorate, the abolition of martial law, security for the communications of the British Empire in Egypt, defense of Egypt against foreign aggression, protection of foreign interests and of minorities in Egypt, and guarantees of British interest in the Sudan. On Feb. 28, 1922, the protectorate was officially terminated; on March 16 the Sultan Ahmed

Fuad was officially proclaimed king as Fuad I. On March 14 the English House of Commons approved the government's Egyptian policy by a vote of 202 to 70. Under Rushdi Pasha a commission set to work to formulate a constitution. The new constitution promulgated in May, 1923, after many stormy preliminary sittings of the commission, contained the following provisions: Egypt is declared a sovereign, free, independent state with an hereditary, monarchical, and constitutional government; Islam is established as the national religion and Arabic as the official language; compulsory free education for both sexes is assured; legislative power is vested in the King in consultation with the Senate and the Legislative Assembly; the King may declare war and make peace through a cabinet; parliamentary assent is needed for the declaration of offensive war, and all treaties of peace and alliance are ineffective without parliamentary ratification; the ministry is responsible to the Parliament; two-fifths of the senators are renominated by the King, and the remainder are elected; the assembly is elected by universal manhood suffrage; the rights of the Egyptian Debt Commission and the Capitulations are not to be affected by legislation. Representation of racial minorities, greater freedom for women, the predominant position claimed by England in regard to Egyptian foreign relations and the military protection of the Suez Canal, all points of sharp contention, were not included in the constitution, nor was the question of the Sudan settled. The Zaghlulists continued in opposition because of the failure of the constitution to incorporate a bill of rights. The unsettled internal affairs led to frequent changes of ministries. Sarivat Pasha resigned on Nov. 30, 1922, after holding office since March 1. Tewfik Nessim Pasha, his successor, was compelled to resign on Feb. 5, 1923, because of his willingness to relinquish the Egyptian claim to the Sudan. After a month of political bargaining a new ministry was formed by Yehia Ibrahim Pasha on March 15. The turbulence in politics indicated with what dissatisfaction Egyptians still looked on the settlement. Feminism and a rampant nationalism which would accept nothing but complete independence were the order of the day, and rioting and outrages were only too frequent. The Egyptian government patterned an ineffectual attempt at retaliation after the methods of the British administration and instituted a rigorous censorship on May 31. The return of Zaghlul and the renewed activities of his executive committee made the campaign preceding the preliminary elections of September 27 bitter. Zaghlul's programme called only for Egyptian independence, and the wholehearted support which his party received showed how thoroughly the country, especially the rural districts, subscribed to the sentiment. As a result of the balloting conducted in September, November, and January, 1924, the Nationalist party was returned with an extraordinary majority, 176 seats out of a total of 214. On January 17 Yehia Pasha resigned; and on January 28, Zaghlul, the outcast and political exile, saw his work crowned with success by the offer of the Premiership. He at once accepted, and in the first days of February he was installed in office amid great rejoicings. One of his first acts was to interrupt Howard Carter's excavations at the tomb of Tutankhamen (q.v.) and to put the work under the con-

trol of the Egyptian Department of Antiquities. In July, 1924, it was reported that Mr Carter had been invited to resume his work in 1925. See ARCHÆOLOGY.

EINHORN, MAX (1862-). An American physician and pioneer in gastroenterology, born in Grodno, Russia. After graduation from the gymnasium at Riga he received the degree of M.D. from the University of Berlin in 1884, migrating shortly afterwards to the United States. Having established himself as a gastroenterologist in New York, he was made professor of medicine in the New York Postgraduate School and Hospital and a visiting physician to the German Hospital. In connection with his special work in gastroenterology, he has devised many new forms of apparatus either for diagnostic or therapeutic work, which are known by his name. One of the most recent and best known of these is the Einhorn duodenal bucket. In addition to being an assiduous contributor to periodical literature, he has written several standard textbooks, as follows: *Diseases of the Stomach* (1896); *Diseases of the Intestines* (1900); *Practical Problems of Diet and Nutrition* (1905); *Lectures on Diatetics* (1914); *The Duodenal Tube* (1920).

EINSTEIN, ALBERT (1879-). A great German-Swiss physicist and author of the special and general theories of Relativity (see RELATIVITY), born at Ulm, Württemberg. Einstein spent his youth in Munich, where his father controlled electro-technical works. He studied at the University of Zurich and supported himself by teaching at the *Technische Hochschule*. Einstein's next few years were years of painful struggle and gradual advancement. Tutor at Schaffhausen from 1900-01, he returned to Zurich for a year, and then became examiner of patents at the federal patent office in Berne. It was while earning his living as a government employee that Einstein published his special theory of relativity as a solution for the paradoxes of the Michelson-Morley experiment (1905). This theory embraced at the time only the interrelationships of space and time measurements, and it was while working out the problems and implications set by this theory that Einstein was led in the next 10 years to generalize his conception so as to include gravitational phenomena, and subsequently electromagnetism as well. In the meantime, having become a Swiss citizen, Einstein was called in 1909 to teach at the University of Zurich, and in 1911, to the University of Prague. The next year, however, he returned to the *Technische Hochschule* in Zurich with the title of full professor. By this time Einstein's reputation had spread throughout the scientific world, and in 1913 he was invited to lecture before the Prussian Academy of Science. The next year he received a research professorship without restrictions from the *Kaiser Wilhelm Institut für Physik* and the University of Berlin.

The outbreak of the War found Einstein formulating specifically the general theory of relativity and indicating certain empirical tests. A revision of the complicated mathematical calculations enabled the theory in 1919 to account for the displacement of the perihelion of Mercury within 1 second of actual observations,

where the theory of Newton had left a discrepancy of 42 seconds. The eclipse of the sun in May, 1919, as observed in Brazil also confirmed the deflection of the sun's rays in the neighborhood of the solar mass as predicted by the theory. Einstein now leaped into world fame over night, and was saluted as the greatest physicist since Newton. He visited England, the United States, Italy, and France, and in each country received great ovations and honors. On his return to Germany, Einstein busied himself with the problems of the quantum theory of radiation, upon which he had published papers dating back to 1907. The phenomena covered by this theory concern the behavior of sub-atomic masses and fall at present outside the range of the relativity principle which provides continuous and invariant equations for systems of large masses. Quanta form therefore the next objective of the Relativity theory, but it has seemed to many scientists doubtful whether the Einsteinian principle could be extended to such phenomena without considerable modification. In his extra-scientific life, Einstein was a fairly typical European intellectual. In politics, he was a liberal with socialistic sympathies. During the period of political effervescence in Germany, he suffered from persecution at the hands of reactionary and anti-Semitic partisans, and threats against his life were reported. While he was in the United States, he took a public interest in the activities of Jewish Zionists.

Einstein's published works include, in addition to numerous papers contributed to learned periodicals, the following books: *The Special and General Theory of Relativity* (Eng. trans., 1920); *Sidelights on Relativity* (Eng. trans., 1922); *The Meaning of Relativity* (containing the Princeton lectures delivered 1921); *The Principle of Relativity* (a collection of essays by Einstein and others, 1923); *Untersuchungen über die Theorie der "Brownischen Bewegung"* (1922). See **PHYSICS, Relativity**

EINSTEIN, LEWIS (1877-). An American diplomat and author, born in New York, and educated at Columbia University. His first diplomatic post was as third secretary at the American Embassy in Paris (1903-05), and since that time he has been at the embassies of: London (1905-06); Constantinople (1906 and 1908); Peking, China (1909); Costa Rica (1911-13), as envoy extraordinary and minister plenipotentiary; Constantinople (1915), as special agent of the State Department; Bulgaria (1915-16), as American diplomatic representative in charge of British interests; and Czechoslovakia (1921-), as envoy extraordinary and minister plenipotentiary. His works include: *Luigi Pulci and the Morgante Maggiore* (1902); *The Relation of Literature to History* (1903); *American Foreign Policy by a Diplomatist* (1909); *Inside Constantinople* (1917); *Prophecy of the War*; *Tudor Ideals* (1921).

EISELEN, FREDERICK CARL (1872-). An American university professor, born at Mundelsheim, Germany, and educated at the gymnasium in Landsberg, Germany, at New York University, Drew Theological Seminary, the University of Pennsylvania, Columbia University and the University of Berlin. In 1902, he was appointed professor of Semitic languages at the Garrett Biblical Institute, becoming dean in 1919. In 1918, he was made professor of Biblical literature in Northwestern University.

He is the author of: *Sidon—A study in Oriental History* (1907); *A Commentary on the Minor Prophets* (1907); *Prophecy and the Prophets* (1909); *The Worker and his Bible* (1909); *The Christian View of the Old Testament* (1912); *Books of the Pentateuch* (1916); *The Psalms and Other Sacred Writings* (1918); *The Prophetic Books of the Old Testament* (1922.)

EISELSBERG, FRIEDRICH ANTON, BARON VON (1860-). An Austrian surgeon known especially as a teacher of surgery, born at Steinhaus. He received his medical degree from the University of Vienna. In 1893, he was appointed professor of surgery in the University of Utrecht, Holland, and in 1896 resigned to accept the corresponding chair at Königsberg. In 1901, he was made professor of surgery in the University of Vienna. He has written comparatively little, his only considerable work being his *Krankheiten der Schilddrüse* (1901). In 1918, appeared his *Festschrift*, which marked the 25th year of professorial activity; this comprised Vol. cx of the *Archives für klinische Chirurgie*, of which he is co-editor, and is made up wholly of papers by numerous prominent surgeons who were formerly his pupils.

EISNER, KURT (1867-1919). A German Socialist and publicist, born in Berlin. He became a journalist, and was many times imprisoned on account of the extreme radical character of his writings. From 1898 to 1905, he was a member of the editorial staff of *Forwaerts* in Berlin; he was subsequently on Socialist papers in Nürnberg and Munich. During the War he turned against his party because it supported the War, and in 1918 was charged with treason at Munich for inciting munitions workers to strike, but he was released. On November 7 of the same year, he held a mass meeting in Munich which led to the overthrow of the Bavarian monarchy and the creation of a revolutionary government with Eisner as president. His policy was extreme. He supported the Workmen's and Soldiers' Councils, and was opposed to the centralizing policy of the Berlin government. He finally agreed, however, to the reestablishment of the federal system and the election of a National Constituent Assembly. But in the meantime, a Bavarian Assembly had been elected. This fortified the fears of the reactionaries, who already hated Eisner sufficiently. As he was going to open the Assembly on Feb. 21, 1919, he was assassinated by Count Arno, and Munich was plunged for a time into a state of Bolshevism. See **BAVARIA**.

ELECTRIC FURNACES. The application of electric furnaces was becoming more general and the construction of the furnaces standardized in 1924. Three classes may be recognized, resistance, arc, and induction. The resistance furnace employs a nichrome or calorite conductor like that used in household heating devices, maintained at a high temperature by suitable current, usually alternating current. A furnace which will hold 1500 pounds of brass employs 300 kilowatts. Temperatures up to 1800°F. may be obtained. Arc furnaces also use alternating currents as a rule, because of

the preference for a transformer for the supply to a motor-generator set. A notable example of an arc furnace is that of the United States Naval Ordnance plant which holds 40 tons of steel and takes 3300 kilowatts normally in the form of three-phase currents at 110 volts. Its maximum current is 21,200 amperes per phase. The transformers are supplied with 6600 volts, three-phase. The induction furnace was the last developed. It is made in small sizes for scientific work and then usually works at very high frequencies. In the larger sizes, for metals such as copper or brass, it works at frequencies as low as 8.5 cycles. In this type of furnace the molten metal itself forms the secondary of a transformer, and the voltage is induced in it by an iron core running through the centre of a circular pot. They are manufactured for as high a rating as 300 kilowatts at 2200 volts on the primary. The repulsion induction furnace is a special form in which the secondary is so placed with respect to the primary that the leakage flux keeps the molten metal flowing by the eddy currents induced in it.

ELECTRICITY, THEORIES OF. See CHEMISTRY.

ELECTRIC LIGHT AND POWER. See MUNICIPAL OWNERSHIP.

ELECTRIC LIGHTING. Striking achievements in the field of electric lighting in the period 1914-24 were: the great improvement in the efficiency of the incandescent lamp and the increase in the intensity of illumination used in general practice. In these 10 years the old favorites, the carbon lamp and the metallized filament lamp, had practically disappeared from the market, and the tungsten filament lamp reigned supreme among incandescent lamps and also superseded the arc lamp in new installations except for display effects. In 1919 the manufacture of the metallized filament lamp was abandoned, and in 1923 only 7 per cent of the lamps made were of the carbon filament type, the remainder were tungsten lamps. These lamps, known to the trade as Mazda, are made in two styles. In one, the Mazda B lamp gives 8 to 12 lumens per watt, in the C type the bulb is filled with an inert gas such as nitrogen, or, more recently, argon. The B lamp is about three times as efficient as the old carbon lamp, and the C lamp about four times as efficient. The C lamp was at first made only in the largest sizes; later it was made in all but the smallest standard sizes.

On account of the changes in the shape of the filament and in the distribution of the direction of the light from these newer lamps, it is no longer possible to compare lamps by the candle power, which is an intensity in a definite direction. Therefore the illuminating engineer has adopted a definite *quantity* of light as the standard of comparison and has called it the lumen. A lumen is most easily understood as the amount of light that would fall on a sheet of paper one foot square placed so that all parts of it were just one foot distant from a candle of one candle-power. Thus lamps are now sold on the basis of the light they give in all directions instead of in only one direction, as formerly. A point source of light of one candle-power gives 12.56 lumens. The average Mazda B lamp gives 8 to 12 lumens per watt,

and the Mazda C from 12 to 18 lumens per watt. The old carbon lamp gave about 3.4 lumens per watt. Statistics show the growth of the use of incandescent lamps and the improvement in their efficiency:

	1913	1923
Total lamps sold in year	105,000,000	225,000,000
Aggregate wattage . .	4,700,000,000	12,400,000,000
Aggregate lumens . .	29,500,000,000	150,750,000,000
Average lumens per watt	6.3	12.1

The effect of this improvement on the pocket-book of the consumer is demonstrated by the total expenditure for electric lighting in the United States in 1923; this was \$600,000,000 for the new high efficiency lamp. If lamps of the low efficiency type common 15 years ago had been used the bill would have been three times as much. The improvement of the incandescent lamp in the last 15 years means a saving of \$1,200,000,000 per year. New York City alone pays a bill of \$700,000 annually for current for lighting its 2800 miles of streets.

Scientific measurements of the prevailing intensities of artificial illumination and of the most desirable intensities has shown that a very great increase is desirable, profitable, and, in some cases, necessary to the preservation of the eye-sight of the nation. Thus in school rooms an illumination of three foot-candles used to be considered good, but now eight foot-candles is recommended. Investigations in the industries have shown that by multiplying prevailing intensities three times, the production of a factory may be increased 20 per cent. There is also a very close relation between industrial accidents and quantity of illumination, and it is accepted that an increase in intensity in dangerous locations very definitely decreases the chances of accidents to industrial workers.

The Illuminating Engineering Society developed a Code of Standard Practice in Illumination which has had a beneficial effect in improving methods, and several States have adopted codes for the regulation of the illumination of factories, streets, schools, etc. By an agreement between manufacturers of lamps and electric lighting companies, the number of special voltages for incandescent lamps was reduced to three standards, 110, 115, and 120. All standard lamps are made for these voltages. A great deal of scientific work was done on the design of fixtures for incandescent lamps, and the name of lumenaire was officially given to such devices. The main requirements are to direct the light uniformly in a desired way (downward) and to eliminate glare. Enclosed lumenaires are now the usual practice, and some sort of reflecting surface above or inside the lumenaire is used to throw the light downward where it is usually desired and most needed. In the scientific study of illumination new measuring devices have been developed, and various forms of illuminometers are in use. By these, the illumination at any place may be read as easily as the page of a book.

While the tungsten filament lamp is much richer in blue and green than the older types of lamps, it still falls far short of daylight in its color content. The gas-filled or C type is better than the vacuum lamp on account of the higher temperature of its filament. To overcome the defect in color a special lamp is man-

ufactured in which the bulb is tinted a bluish-green, which absorbs the excess of red and yellow of the filament and thus gives a reduced amount of light with a better distribution of colors. This is known as the daylight lamp. By means of outside screens a real reproduction of daylight may be obtained with this lamp. This is found useful in matching colored cloths, and physicians employ it in examinations of inflamed internal membranes, as in the nose and throat.

To facilitate the making of moving pictures at night with better color effect than that given by the mercury lamp, a very large size of tungsten incandescent lamp has been developed which takes 30,000 watts, 1000 times as much as the usual lamp in the home; it gives a proportionate quantity of light. The high intensity gas-filled lamp has been adapted, by giving the filament a special shape which approximates a point source, to use in stereopticons and moving picture machines for projection purposes. It is rapidly superseding the arc lamp on account of the reduced fire hazard. Consult Croft. *Practical Electrical Illumination and Standard Lighting* (New York)

ELECTRIC MOTORS IN INDUSTRY.

The steel mills of the United States were gradually superseding their steam and gas engines by electric motors in the decade 1914-24. At the end of that time, 5,000,000 horse power of electric motors were in use in American steel mills, in sizes up to 8000 horse power. The most striking application was that of driving enormous rolling mills by direct connected electric motors. This had become standard practice. The majority of motors are of the three phase induction type, which includes the largest motors; but some direct current motors of 4000 horse power are in use. These motors start, stop, and reverse the rolls by electric control and are noted for their quick responses to the control. In some special cases, where a variable speed is required, the Scherbius system of speed control is used. In this a large induction motor is used to drive the load, and its secondary electric circuits are connected to a polyphase alternating current commutator motor, which in turn drives an induction generator connected to the same electric mains as the principal motor. By electrical control of the commutator motor, it is made to take more power from the secondary of the load motor, which therefore decreases in speed. This power is returned to the line by the induction generator. By adjusting the power taken by the commutator motor, the speed of the main induction motor may be controlled through a wide range without wasting the energy as would be done with rheostats.

Mining. The mining industry showed a notable trend toward the substitution of electrical machinery for steam engines and the use of purchased power instead of isolated plants. In the year 1923 electrically operated mine hoists aggregating 40,000 horse power were installed. Eighty per cent of these were for alternating currents. The sizes of motors ranged from 100 horse power to 2000 horse power. In 1924 the mining industry ranked second in the United States in the aggregate capacity of electric motors in use, with its 2,890,000 horse power and third in the consumption of electrical energy from central stations.

Mine Hoists. The most usual application is to mine hoists. All new hoists are electrically

driven, and many old steam driven hoists are being changed over to electric. Installations are of three kinds:

(a) Direct drive of the hoist by a large three-phase induction motor taking power from the supply lines. This is the simplest and cheapest arrangement but puts a variable load on the electrical system. An example is that of the Tennessee Coal and Iron Company at Muscoda, Ala., in which an 1800 h.p., 2200 volt three-phase motor superseded a steam engine in hoisting a load of 27,000 pounds up a slope of 5000 feet at a speed of 2700 feet per minute. For lowering, the motor is reversed electrically.

(b) A direct control motor is used to drive the hoist, and this is supplied from an alternating current-direct current motor generator set operating on the Ward-Leonard system, by which the control of the speed is most conveniently and economically accomplished. The set has a three-phase synchronous motor, which by its good power factor assists in the voltage regulation of the distribution system. For example, the Vandalia Coal Company of Indiana has a number of such sets in which an 800 h.p., 500 volt direct current motor drives the hoist through gearing, and this motor receives its power from a motor-generator set having a synchronous motor operating from the alternating current supply lines and driving a suitable direct current generator. By changing the field current of this generator the speed of the hoist motor is regulated.

(c) The Ilgner-Ward-Leonard System, in which the motor generator set contains an induction motor, a fly-wheel, and a direct current generator. A speed controller so regulates the set as to cause it to take a fairly uniform amount of power from the supply lines while delivering a very variable power to the hoist motor. An example is the Cleveland Cliffs Mining Company of Michigan. The duty is to raise 12,000 pounds of iron ore per trip, up a lift of 2700 feet at a speed of 1800 feet per minute. One 900 h.p. direct current motor drives the hoist and is supplied by a motor-generator set having a 30-ton fly wheel. The hoist motor takes, at most, 1700 h.p. from the set, a large part of which is supplied by the fly wheel, so that the peak demand on the supply lines is only 960 h.p.

The very general application of electric motors to hoists, cranes, loaders, etc., has resulted in important changes in the design and a great development in the machinery and its application. These devices have been built in much larger sizes than previously. One example of the magnitude which such apparatus has reached is the Baltimore and Ohio coal loader at Curtis Bay, Md., near Baltimore. This loader will unload 8000 tons of coal per hour from coal cars and deliver it to the hold of a ship at a somewhat slower rate. The coal is conveyed along the pier by eight parallel belts driven by electric motors, all controlled by one operator on the bridge of the pier. The coal is transferred automatically to transverse belts which drop it into the vessel alongside the pier. To fill the spaces between the hatches in the hold of the vessel a trimmer is used. This trimmer throws the coal a distance of 50 feet, if necessary, and each trimmer handles 100 tons per hour. By this means a vessel has been loaded with 9500 tons in 9.5 hours; this task would have required

200 men for 25 hours if hand trimming had been used.

Electric Cranes. Electric cranes were being built in 1924 in very large sizes as well as small and were equipped with alternating current motors or direct current motors specially adapted for the purpose. An electric crane of unusual magnitude has been built for service in a shipyard. It has a maximum height of 230 feet, a length of boom of 300 feet and a hoist of 170 feet. It is capable of lifting loads of 350 tons. Several motors aggregating 300 h.p. are used for the various movements, all controlled from a central point.

Electric Shovels. Electric shovels were replacing the familiar steam shovels and were built in larger sizes than the steam shovels. A large size shovel is rated at 300 tons, has a bucket capacity of 8 cubic yards, and can be filled and emptied in 45 seconds. One man controls all the operations by means of two controllers, one for each hand, and foot pedals. It contains four direct current motors for working, aggregating from 500 to 600 h.p. These direct current motors are supplied by a motor generator set in the cab consisting of a three-phase alternating current synchronous motor for 4000 volts driving a 250 volt direct current generator of suitable capacity.

Electric Drills. The enormous activity in the oil industry made it worth while to develop a standard electric-driven drill in which it is possible to use a three-phase alternating current motor of from 50 to 100 h.p. to drive the drill by means of gearing and chain drive. The motor can take power from a cheaply installed transmission line tapping a main transmission system.

Brush Shifting Motor. A new adjustable-speed polyphase motor was brought out, known as the brush shifting motor, in which the speed may be nicely controlled within a wide range by shifting the brushes. Its most general application was for blowers in power plants.

Clock Motor. An interesting development was the clock motor, a small synchronous motor for actuating clocks. It is connected with the alternating current mains of a central station in a customer's house, and as the frequency of the system is kept constant the clock runs at constant speed and repeats the time of a master clock in the power house. Averaged over 24 hours it will keep excellent time, but it may run a second to the minute fast or slow for short periods.

Position Indicator. The position indicator is a similar device, a repeater which has had an important application on shipboard. It consists of one master and several repeater synchronous motors whose fields are supplied with single-phase alternating current and whose three-phase stators are connected in multiple and located at distant points. At whatever point in its angular position the master is set the several repeaters will show accurately, and if the circuit is broken and reestablished the repeaters will adjust themselves correctly. Consult Annett, *Electrical Machinery* (New York) and the books referred to under **ELECTRIC POWER STATIONS AND GENERATING APPARATUS**.

ELECTRIC POWER STATIONS AND GENERATING APPARATUS. The business of the electric central stations increased in the interval between 1914 and 1924 at a rate almost equivalent to a doubling every five years, so that

these stations in 1924 supplied 57 per cent of the energy used in all the industries of the United States and had a capitalization of \$5,000,000,000. This is indicated by the following statistics of central stations:

	1913	1923
Capacity in kilowatts . .	7,000,000	22,000,000
Output, millions of kw. hrs.	16,800	52,000
Gross earnings	\$337,000,000	\$1,200,000,000

The principal users of the output of the central stations were:

	1923	H. P.	Millions of kw. hrs.
Iron and steel industry	4,956,000		8,115
Mining industry	2,890,000		4,113
Chemical industry	2,197,000		6,074

This growth in the use of electric power exerted an important economic influence by increasing the production and decreasing the cost of manufacture as a result of the increased substitution of mechanical power for manual labor. Census figures show that in all the industries of the United States the gross production per year amounted to \$3400 per employee with the use of 3.5 h.p. of mechanical power per employee, while in Great Britain the production was \$1200 and the power 1.6 h.p. per employee. All other countries fell below Great Britain. With the increasing cost of coal it was found more economical to generate the electric energy in large central stations where the coal can be used most efficiently and where coöperation makes the load more steady, or, in technical phraseology, where the load factor is better. The same cause has resulted in a very notable increase in the number and size of the hydroelectric stations. These are generally operated in a system containing steam stations, and the load is allocated by a load dispatcher so that the most economical stations (hydro) operate all the time, and the less economical only carry the peak loads.

Generators. The most striking development in electric generating apparatus was the steady growth in number and size of steam turbo-generator sets and the practical extinction of the slow speed engine-driven sets. In 1914 a unit of 30,000 kilo-volt-amperes (40,000 h.p.) was considered noteworthy; in 1923 several units of 62,500 kva. (84,000 h.p.) were constructed. With the increase in capacity there has also been a steady increase in the steam pressure and temperatures used in the turbines. Thus from 215 pounds gauge and 150°F. superheat, practice has advanced to 600 pounds and 725° maximum temperature, making it possible to obtain one kilowatt-hour at the bus bars for 17,000 in the full B.t.u., giving an overall efficiency about 20 per cent.

Many improvements were made in the design of the electric generator itself so that this great increase in power capacity is obtained with only a small increase in the dimensions and weights. Modern generators weigh much less per kilowatt than those of 1914. This was made possible by pushing the peripheral speed up to about 25,000 feet per minute, by the use of mica insulation on the armature and asbestos on the fields, and by improving the ventilation. Efficiencies of 98 per cent and higher are common in these generators. A notable change in practice was

the rapidly increasing use of closed circuit ventilation. The air for cooling purposes, after passing through the generator and carrying off the heat, is sent through a radiator like that used on an automobile, except that the water cools the air, or the air is passed through a spray of water to which it gives up its heat, and then is returned in closed ducts to the generator to be used over again. The advantage of this is that no dust nor dirt is carried into the generator to clog its air ducts.

The development of a successful voltage regulator had a marked effect on the design of large alternating current generators; freed from the requirement of good inherent regulation in the machine, the designer has freer hand in his design and can economize in material. There was a steady trend toward 60 cycles as the standard frequency. It is now possible to obtain synchronous motors and converters of large sizes which will operate entirely satisfactorily at this frequency, so that the principal reason for choosing 25 cycles has disappeared.

As a result of the increase in the size of the generating units and particularly the increase in length, the type of set using a vertical shaft went out of favor and the horizontal shaft came into universal use. The improvements in the efficiency of these generating sets was so rapid that it was the rule to scrap a perfectly good set after a few years' use and buy a new and larger one, because the new one would require so much less coal in a year that the saving in cost of coal would more than pay the interest on the cost of the new set. Some of these large sets use \$1,000,000 in coal each year, so that a saving of 10 per cent is substantial. This is what is meant by obsolescence.

A feature of the development of steam turbines was the two cylinder machine in which the turbine is divided into two parts, one for high pressure steam and the other for low pressure steam. Each part has its own generator, connected in parallel electrically, but independent physically. The same steam passes first through the high pressure turbine and then through the low pressure part to the condenser. This design is particularly desirable with the reaction type of turbine which has a tendency to be long and clumsy in dimensions.

In the design of power stations a change to be noted was the smaller number and larger capacity of the units as a result of the greater reliability of the newer machines and also of economic conditions. Central stations cultivated off-peak load customers, such as those that use power many hours per day, and therefore improve the load factor of their stations; that is, they raised their average all-day load to approach more nearly their maximum peak load. On account of the very good efficiency of large size units, as compared to smaller sizes, and a new business policy on the part of the central stations resulting in more reasonable rates, the isolated plant is becoming more and more rare. Almost all recent new buildings and industries obtain their electrical energy from a public service company instead of installing an independent generating plant. The growth of hydro-electric stations was very great because of the high cost of coal. Many a station of this type which some years earlier faced bankruptcy showed a good profit in 1924, and many new stations were built, although the cost of construction was almost double the 1914 figure.

The size of generating units used increased rapidly. In 1916 the largest water-wheel generators in service were of 18,000 kw.; 1921, 232,000 kw., 1922, 45,000 kw., and 1924, 65,000 kw. The operating speeds were increased each year so that a 60,000 kw. machine of 1924 was not much larger than an 18,000 kw. machine of eight years previous.

Circuit Breakers. With the growth in the size of units and the increase in station capacities it was necessary to develop new, larger, and more powerful circuit breakers or switches to open up the circuits in case of trouble or short-circuits. The type breaking the circuit under oil became universal in alternating current systems, and these were developed and constructed to cut off successfully short-circuits taking thousands of amperes at thousands of volts. Some circuit breakers installed were capable of interrupting 1,500,000 kilo-volt-amperes, and the manufacturers stated their willingness to construct breakers capable of interrupting 3,000,000 kva. (4,000,000 h.p.)

Control and Protection of Circuits. In 1914 the practice of protecting generators by inserting reactors or inductance coils in series with them to limit the current which would flow on short-circuit was new and not general. In 1924 every large station had several of these devices designed to limit the current to a certain definite maximum value. Some stations connected these in the generator leads as well as in the feeders; the latter was the more usual connection. The control and protection of large distributing systems was furthered by the development of relays accomplishing innumerable purposes indicated by their names, overload relay, low voltage relay, reverse current relay, time relay, etc. These were ingenious electromagnetic devices designed to open large circuit-breakers when any one of these various phenomena occurred. One of the notable developments in electrical engineering is the increase in number and kinds of relays and their applications. A new type of switching equipment came into general use, the truck type safety switch. This is an oil switch mounted on a rolling truck and so arranged that when the switch is open, the switch and its truck may be rolled out into an open passageway, so that it is left entirely disconnected from all potential and is safe and convenient for inspection and repair. The phase balancer is a machine which was developed and installed in some large power systems. It is a special form of synchronous motor connected to the lines of a polyphase system; its function is to maintain a balanced load on the different phases of the generators even if the load on the system is very unevenly distributed between phases. This results in better voltage regulation and better generator efficiency.

As a matter of good economic policy it was found desirable to interconnect all neighboring power systems, so that in case of an overload or an accident in one system, energy might be supplied by another. In the case of systems of the same frequency this is done by transformers, but with two systems of different frequencies, e.g. 60 and 25, a frequency converter must be used. This may consist of two machines of like power on the same shaft, one having 10 poles for 25 cycles and the other 24 poles for 60 cycles, but this is an expensive arrangement. A new set was developed in 1923 consisting of a

37,000 kva. induction motor with 14 poles for the 60-cycle system and a 25,000 kva. 25-cycle synchronous motor with 10 poles. The induction motor takes power at 60 cycles and tends to run at 514 revolutions per minute but is held to 300 revolutions by the other machine. Thus the secondary of the induction motor generates power at 25 cycles, slip frequency, which may be turned into the 25-cycle system along with the power developed by the synchronous machine. In case the demand is in the opposite direction the frequency of that system becomes slightly less than 60 cycles, and the induction motor becomes an induction generator and delivers power at the frequency of the system, while the 25-cycle machine operates as a normal synchronous motor.

Bibliography. Among the more notable works on electric power stations and generating apparatus published between 1914 and 1924 were Croft, *Central Stations* (New York, 1920); Fernald and Orrok, *Engineering of Power Plants* (New York, 1920); Gebhardt, *Steam Power Plant Engineering* (New York, 1912); Langs-

ing in 1924 was the movement for the construction of a super-power transmission system, a forward-looking scheme for the combination of all producers and users of mechanical power in a given geographical district of the United States into one large electrical network. The advantages sought are reliability, secured by the ability of the various power houses to help each other out in case of accident to one; greater economy, through the use of most efficient stations all the time and the less efficient only when actually needed; better load factor, from less variable demand made by a greater number and variety of users in the system; shutting down of wasteful stations; reduction in the cost of fuel by concentrating the load at those places where fuel can be obtained most conveniently, and utilization of water power wherever practical. The plan contemplated several districts at first and a final interconnection of these districts as they spread toward each other. California was the heart of the first district where it went into actual operation. Here the plan was well under way in

ELECTRIC POWER TRANSMISSION AND DISTRIBUTION. The most striking subject of discussion in transmission engineer-

ing in 1924, for on account of the scarcity of coal, the generation of power was in the hands of a few corporations which could cooperate readily.

Another interesting district was that of the North Atlantic States. Here it was proposed to install a 250,000-volt transmission line from Boston to Washington through New York, Philadelphia and Baltimore, with possible branches to the coal fields of Pennsylvania. It was proposed that all the large generating plants in this district should connect up to the system and supply power, and that all the small plants of individual factories be shut down, since they could save money by buying from the large system. In his report to the Secretary of the Interior, W. S. Murray estimated that 10,000,000 h.p. was used in the industries in this district, and 7,000,000 h.p. used by the railroads; that the load factor of this power

was about 15 per cent and that by combination this load factor could be raised to 50 per cent or 60 per cent. This meant that the 17,000,000 h.p. in use could be replaced by 6,000,000 h.p. properly located and controlled, and that 30,000,000 tons of coal could be saved each year and the railroads relieved of the congestion caused by the useless and uneconomic transportation of this coal. The same authority estimated that it would cost about \$1,250,000,000 capital to accomplish the change and that the resultant saving would be \$300,000,000 per year, or 24 per cent on the investment. This was for only one geographic district. The difficulty was to get so many different interests together and assure to each its share of the saving or gain.

Elevation of a high tension line tower with strings of insulators, ring shields, and conductors

Transmission Lines. The most important accomplishment of the period in transmission engineering was the adoption of 220,000 volts as a working potential for transmission lines and the practical operation of two such lines. Previously 165,000 was the highest potential used in regular practice. The two lines installed were both in California. The Southern California Edison Company had a line 240 miles long installed and planned in 1924 to extend it. Incidental to the use of 220,000 volts as a working potential, the manufacturing companies built transformers for 1,000,000 volts for laboratory purposes to test out the apparatus to be used in the 22,000 volt lines. Transformers in sizes up to 16,000 kva., built for commercial purposes, were arranged with 130,000 volt high-tension windings for a Y connection on 220,000 volts with the neutral grounded. The line itself used large steel towers, eight to the mile, carrying the three conductors in a horizontal

plane, hanging from strings of suspension insulators. Each string of insulators was protected by a static shield consisting of a metal ring surrounding and concentric with the insulators. This ring was connected to the conductor and reduced the potential strain on the insulators by giving the electrostatic field a more uniform distribution. Authorities disagreed as to whether an overhead ground wire or lightning arresters were of any benefit on lines of this high potential. In the Southern California line the conductors were 0.95 inch in diameter, were stranded aluminium cable with a steel core, and were spaced 210 inches apart. Experimental research indicated that with conductors of about 1 inch in diameter the loss from corona would not be important. The duplicate lines of 6 conductors were carried on 2 lines of steel towers so that the minimum clearance above ground was 30 feet. The insulators were of the disc suspension type, 13 in each string, and shielded with rings.

The outdoor type of switching station became usual rather than exceptional. With the increase in the potential used the space required for the switches, circuit breakers, and lightning arresters became so great that it was expensive to put them in a building, and they could all be made water-proof. Oil-cooled transformers and water-cooled oil-insulated transformers continued to lead the air-cooled in number of applications and were improved by the addition of a device known as the oil conservator, a reservoir attached to the oil tank and above it so that the transformer tank proper was always full and completely sealed from the atmosphere. This reduced oxidation of the oil, moisture in the oil and the danger of explosive gases. The increase in length of transmission lines raised a serious problem in the regulation of the voltage and the power factor of the system. This was met by the use of synchronous condensers with relays controlling the field excitation to hold the voltage and power factor at predetermined values. In a 220,000 volt line it was proposed to place such a device in circuit every 100 miles. Single units of this character of 30,000 kva. were placed in service. The use of the static condenser for alternating current distribution circuits grew considerably. These were oil-insulated static condensers connected to the end of a distribution system to improve the power factor and voltage regulation of the system. They operated at about 2200 volts, and if the voltage of the system were much less than this, auto-transformers were used to step up the voltage.

The oxide film lightning arrester was brought into quite general use. It consists of a number of units in series, depending on the voltage of the system, each unit constructed of two conducting plates separated by a short space filled with oxide of lead in the form of a powder, paste or pellets. Ordinarily this material is non-conducting, but an excess potential breaks through and allows a discharge current. This current heats the material in the small area through which it flows, and this heat changes the character of the material at that particular point into an insulator, thereby healing up the punctured spot. These are used for voltages up to 135,000.

The transmission of energy by underground cables, as in large cities, was improved by the use of improved insulating materials, resulting

in the successful operation of cables at much higher potentials. In 1914 the highest voltage was 13,000, but in 1924 three conductor cables for 33,000 volts had been installed and single conductor cables for 44,000 and 66,000 volts were in use. See ELECTRIC SUBSTATIONS.

ELECTRIC RAILWAYS. In 1914 the New York Central; the New York, New Haven, and Hartford; the Northern, the Butte, Anaconda and Pacific, and the New York terminal of the Pennsylvania Railroad were the outstanding accomplishments. In the succeeding 10 years were added to this list the Norfolk and Western, 1915; Pennsylvania Railroad (Philadelphia), 1915; Chicago, Milwaukee and St. Paul, 1916; Bethlehem (Chili), 1918; Paulista (Brazil), 1920, and the Vera Cruz-Mexico City, under construction in 1924. These were equipped by American manufacturers, and so were the Paris-Orléans in France and the Spanish Northern. Numerous roads of lesser importance were also equipped with electric locomotives. The majority of these installations were fitted with the high voltage (2400 or 3000) direct current system; the Norfolk and Western and the Pennsylvania used the alternating current system.

The Norfolk and Western is typical of the alternating current roads. This covers the division from Bluefield, W. Va., to East Vivian; the service consists of hauling coal trains of 3250 tons up a 1.25 per cent grade at a speed of 14 miles per hour, requiring 3200 h.p. at the locomotive. Twelve electric locomotives of 264 tons replaced 33 steam locomotives of the Mallet type. The electric locomotives take current at 11,000 volts, 25 cycles, single-phase, from an overhead trolley. This is converted to three-phase currents by a phase converter on the locomotive and supplied as such, at a suitable voltage, to the three-phase induction motors which drive the locomotive. The merit of the combination was that the three-phase motors are more efficient than single-phase motors; they are constant speed motors which will regenerate power on down-grades automatically at a definite speed and thus act as brakes; finally, by means of this converter a single overhead trolley may be used to supply three-phase motors. The St. Paul Railway put into operation a section of 440 miles in Montana in 1917 and a second section of 220 miles in Washington in 1920. The first includes the heavy mountain grades of 2 per cent. Both are equipped with an overhead trolley operating at 3000 volts direct current, from which the electric locomotives of 290 tons take current. These locomotives are capable of hauling trains of 2500 tons up the grades at 16 miles per hour, giving 3000 h.p. continuously, and each locomotive makes the entire run of 440 miles without change or lay-off. The train crews are changed in the middle of the run. The locomotives also use regenerative electric braking when descending grades; that is, the electric motors act as generators, hold the train at a desired speed, and return the energy of the descending train to the line to be used elsewhere. This railroad

takes its electric energy from existing public utility companies, which in turn derive it mainly from water power. In Norway and Sweden the single-phase system was considerably extended, and in Italy the three-phase system was further developed and extended.

Among urban street railways the rapid and general adoption of the light weight or one-man safety car was the outstanding feature. This is a very light car of moderate passenger capacity, usually having two motors of 20 h.p. The car doors are arranged to open and close automatically, interlocking with the control of the motors so that the car cannot be started until all doors are safely closed. With this precaution it is safe for one man to act both as motorman and conductor; this reduces the cost of labor, and the light weight reduces the power required.

The development of the automatic substation was an achievement of the period, and the increase in its use was phenomenal. It was employed in many applications and industries, but its most general and important field was the electric railway. This is a substation for the conversion of the high-voltage alternating-current power of the transmission line to the low-voltage direct-current power of the trolley or third rail. The station contains transformers, converters, and switches, operated by relays so that the machinery is started up just when it is needed and shut down when the demand has ceased, without the intervention of any human labor. The relay controls all the operations. An inspection of a few minutes each day is all the human attention the station requires. See ELECTRIC SUBSTATIONS.

Some interesting tests were made at Erie, Pa., in the fall of 1923 to determine the maximum current which can be collected from an overhead trolley and the limit to the power of a locomotive on such a system. Currents of 4000 to 5000 amperes were collected at speeds of 50 to 60 miles per hour from two No. 000 wires by one pantograph trolley pressing upward at a pressure of 35 to 40 pounds. With 3000 volts on the trolley this is equivalent to about 20,000 h.p. per locomotive.

ELECTRIC SHIP PROPULSION. The art of propelling ships by electric motors had practically its entire development since 1913, when the first vessel so equipped, the American collier *Jupiter*, was put into commission. She had two 3000 h.p. three-phase induction motors on twin propeller shafts deriving their power from one steam turbo-generator of 5450 kilowatts. At the time of the Naval Disarmament Conference, the United States had built and under construction 20 electrically propelled vessels, mostly of the largest size, 30,000 tons each. Many of these were discontinued, but the U.S.S. *New Mexico*, *Tennessee*, *California*, *Maryland*, *Colorado*, and *West Virginia* were completed. These battleships were in commission in 1924. Each of them had four propeller shafts and four motors aggregating 32,000 h.p. Under construction were some airplane carriers having 180,000 h.p. of electric motors per ship. The battleships all use changeable pole induction motors capable

ELECTRIC RAILWAYS

ELECTRIC LOCOMOTIVE FOR HANDLING HEAVY-TONNAGE TRAINS ON THE NORFOLK AND WESTERN RAILROAD

Built by the Westinghouse Electric & Manufacturing Co. and the Baldwin Locomotive Works, this high-capacity electric locomotive takes current from the overhead trolley at 11,000 volts, which is stepped down by a transformer to 250 volts at the terminals of single-phase induction motors. These by means of gearing and rod drive act on the driving wheels as shown above.

ELECTRIC RAILWAYS

ELECTRIC FREIGHT LOCOMOTIVE OF THE CHICAGO, MILWAUKEE AND ST. PAUL RAILWAY
Built by the General Electric Company and operating at 3000 volts direct current

of operating at two different speeds, usually 16 and 21 knots. As an example, the *Maryland* had two electric generators of 13,000 kilowatts each, driven by steam turbines at 2000 revolutions per minute. Her four propeller shafts were each driven by an induction motor rated at 7000 h.p. at 175 r.p.m. with 24 poles for 21 knots speed, and 1700 h.p. at 118 r.p.m. with 36 poles for 16 knots. One of the important advantages of electric propulsion for such vessels is the ability to reverse any propeller with full power at a second's notice. Steam turbines alone cannot be reversed so quickly or with so much power. The ability to operate conveniently and efficiently at two different speeds is another point in its favor, and the light weight and good efficiency obtained by the use of the high speed turbines is a third. Over 45 ships, aggregating 550,000 h.p., had been equipped for electric drive up to 1924.

A development particularly adapted to freight vessels was the use of Diesel engines driving electric generators which in turn drive the motors on the propeller shafts. The Diesel engine is difficult to start, to reverse and to build in large sizes. With the electric system any number of units may be used, connected into an electric system, and the engines may run continuously in the same direction, the stopping and reversing being done at the motors.

ELECTRIC SHOVELS. See **ELECTRIC MOTORS IN INDUSTRY.**

ELECTRIC SUBSTATIONS. The development of apparatus for substations kept pace with other advances. Synchronous converters were built, of larger capacity and for higher speeds, and the weight per kilowatt decreased. The improvement in 60-cycle converters was notable; by 1924 there could hardly be any prejudice against them. The substitution for converters or motor-generator sets was revolutionized; it was made independent of all labor for attendance. By the development of ingenious relays, these automatic substations start up when needed; the machines are brought up to speed, synchronized with the supply system, and connected to the load circuit. This idea was first put into effect in 1916, and in 1924 hundreds of such stations were in operation, in sizes up to 4000 kilowatts and for voltages up to 3000 on the direct current side. This idea was first introduced in the electric railway systems (see **ELECTRIC RAILWAYS**) and was so successful that it was adopted for industries, mines, and even small isolated water power plants forming part of a system. Thus it is possible to place a water power station in some out-of-the-way place where hydraulic development is cheap, have it feed current into a system when power is desired, and yet have it require no attendants in the station. An inspector visits these stations regularly and tests them out; that is all the attention required. A water power station of this character for 7500 kilowatts capacity was installed near Little Falls, N. Y.

ELECTRIC THEORY. See **CHEMISTRY.**

ELECTRIC WELDING. The uses of electric welding became so important during the War that the United States government fostered a special organization to study and develop the art. Under this stimulation research was carried on, new methods devised, and new applications found. A large part of the repair work on the German steamers interned in 1914 and

taken over by the United States in 1917 was done by electric welding. Ships were built in which welding was substituted for riveting. Electric generators were devised which so regulated the current as to give a uniform character of weld. While most of the welding was done with direct current, alternating current could also be used.

ELIOT, SIR CHARLES EDGE CUMBE (1864-). An English diplomat and Orientalist (see **VOL. VII**). He was British High Commissioner in Siberia in 1918, and in 1919 was appointed British Ambassador to Japan. He published *Hinduism and Buddhism* (1921).

ELIOT, CHARLES WILLIAM (1834-1926). An American educator (see **VOL. VII**). He favored the League of Nations and was a strong supporter of President Wilson and his administration. In his writings and lectures he has stressed in particular his condemnation of the standardization of education and industry. He was presented with a medal for distinguished service by the National Council of Civic Reform in 1923. He published *The Road Toward Peace* (1915), and *A Late Harvest* (1924).

ELIOT, SAMUEL ATKINS, JR. (1893-). An American author born in Denver, Colo., and educated at Harvard University. He studied the German and English theatres and went on the stage with Miss Horniman's Repertory Company in England. In 1914-15, he was play reader and stage manager for Winthrop Ames in New York. In the latter year he joined the Washington Square Players; in 1916-17, directed the Indianapolis Little Theatre and in 1917-18, the Cincinnati Art Theatre. He wrote books on the theatre and made many translations from Wedekind. His works include *Little Theatre Classics* (3 vols., 1918-21), *Erdegeist* (1914), *Pandora's Box* (1914), and *Tragedies of Sex* (1923). The three last are translations.

ELIOT, THOMAS STEARNS (1898-). An American poet and critic, born at St. Louis. He studied at Harvard, the Sorbonne and Oxford. From 1913 on he made his home in London. He first attracted attention with his *Poems* (1920), a thin sheaf of 63 pages containing some of the best pieces of the decade. He was preëminently an ironist and his mocking, possibly only clever, poems stirred and antagonized the modern literary world. The *Waste Land* (1922), a poem of little more than 100 lines, was at first bitterly contested: by some it was put down as an important achievement, by others as a plain hoax. But the former opinion seemed the more nearly correct, for in spite of its obscurities, pedantries, and often perverse symbols, the *Waste Land* with its feel of the essential aridity of the modern life and its fine poetical passages, was a memorable work. Mr. Eliot's critical studies were considered by some even more noteworthy than his poetry. His *Sacred Wood* (1920) shows the first English attempt, since Matthew Arnold, to formulate a thoroughgoing æsthetic creed applicable to literature and life. In 1922 he became the editor of the *Criterion*, a finely balanced periodical devoted to the arts.

ELISAVETPOL. See AZERBAIJAN.

ELIZABETH. A manufacturing and residential city of New Jersey. The population rose from 73,409 in 1910 to 95,783 in 1920, and to 103,947, by estimate of the Bureau of the Census, for 1923. An ordinance was adopted in 1922 zoning the city into three residential, three business, and three industrial districts. A city planning commission was engaged in developing in 1924 a comprehensive plan for future growth. The city had 238 manufacturing establishments, six banks, and two savings banks in 1924.

ELIZALDE, RAFAEL HECTOR (1873-). A South American diplomat, born at Guayaquil, Ecuador, and educated at the National College of San Vicente del Guayas and the University of Guayas. Before being appointed envoy extraordinary and minister plenipotentiary to the United States and Cuba in 1916, he served his country at various South American embassies, assisting in the settlement of the boundary line between Ecuador and Colombia. He is the author of *Laborers Diplomáticas* (1912), *Organización de Partidos Políticos* (1913), and *Riqueza Obliga* (1914).

ELLIOTT, EDWARD (1874-). An American lawyer, professor and banker, born at Murfreesboro, Tenn., and educated at the universities of Princeton, Berlin and Heidelberg. From 1898 to 1915 he was successively instructor in Latin and jurisprudence, preceptor in the department of history, politics and economics, and professor of politics at Princeton University. He was also dean of the college from 1909 to 1912. In 1913, he went to the University of California as lecturer on international law, and from 1916 to 1920 was professor there. From 1917 to 1920, he was director of the Federal Reserve Bank of San Francisco, and in 1921 became vice-president of the Security Trust and Savings Bank of Los Angeles. He is the author of the following works: *Die Staatslehre John C. Calhouns* (1903); *The Biographical Story of the Constitution* (1910); *Selected Documents in International Law* (1914); *American Government and Majority Rule* (1915); *State Bank Membership in the Federal Reserve System* (1919). He also contributed articles to periodicals.

ELLIOTT, HOWARD (1860-). An American railway official (see Vol. VII). In 1913, he was appointed president of the New York, New Haven and Hartford Railroad Company, serving until 1917, when he resigned and was appointed chairman of the Commission on Inter- corporate Relations for that road. In 1918, he was appointed president of the Northern Pacific Railway, serving until 1920, when he was appointed chairman of the board of directors. During the War, he was a member of the special committee on national defense of the American Railway Association. He was a member of the executive committee of the Louisiana Purchase Exposition and was a member of the American Railway Association and other associations and societies.

ELLIS, HENRY HAVELOCK (1859-). An English psychologist and author (see Vol. VII). Among his later works are: *The World of Dreams* (1911); *The Task of Social Hygiene* (1912); *Impressions and Comments* (1914. Second series, 1920); *Essays in War-time* (1916); *The Philosophy of Conflict and Other Essays* (1919); *Little Essays of Love and Vir-*

tue (1922); *Kanga Creek, an Australian Idyll* (1922); *The Dance of Life* (1923).

ELLIS, WILLIAM THOMAS (1873-). An American journalist and author (see Vol. VII). In 1917, he spent six months in Russia and in the year following was correspondent on the Persian, Caucasus, Rumanian and French fronts. He was special correspondent of the *New York Herald* and associated newspapers in the Balkans (1919) and represented the *Chicago Daily News* and associated newspapers at the Conference on Limitation of Armament at Washington, D. C. (1921-22).

ELLWOOD, CHARLES ABRAM (1873-). An American sociologist (see Vol. VII). He published *The Social Problem* (1915, 1919), *An Introduction into Social Psychology* (1917), and *The Reconstruction of Religion: A Sociological View* (1922).

ELMIRA COLLEGE. An institution for women at Elmira, N. Y., founded in 1855. It practically doubled in size during the decade 1914-24. The student enrollment increased from 234 to 500, the teaching staff from 22 to 43, and the library from 11,000 to 20,000 volumes. The endowment grew from \$134,572 to \$776,644 and the annual income from \$76,635 to \$265,650. Ten new buildings were erected, including one large and several smaller dormitories, a large dining commons, a faculty house, and a dean's house. The campus was enlarged, and a library building, the first unit of which was to cost \$150,000, was in course of construction in 1924. Frederick Lent, Ph.D., D.D., LL.D., succeeded A. Cameron MacKenzie, D.D., LL.D., as president.

EMBRYOLOGY. See ZOÖLOGY.

EMERGENCY FLEET CORPORATION. See SHIPBUILDING; SHIPPING.

EMERSON, JOHN (1874-). An American playwright and producer born at Sandusky, Ohio, and educated in Chicago and New York. He acted and produced plays for Daniel Frohman, William Harris, the Shuberts, Clyde Fitch and others until 1910. He wrote and played in *The Conspiracy* (1912) and *Step Lively* (1913). He wrote and produced motion pictures for D. W. Griffith, Douglas Fairbanks, Mary Pickford, Constance Talmadge and others until 1922, and later formed the Emerson-Loos Company, writers and producers of motion pictures.

EMERTON, EPHRAIM (1851-). An American historian (see Vol. VII). He became president of the Cambridge Historical Society in 1921. Since 1914 he has published *Beginnings of Modern Europe* (1917), *The Defensor Pacts of Marsiglio of Padua* (1920), and *Learning and Living*, essays (1921).

EMERY, HENRY CROSBY (1872-1924). An American economist (see Vol. VII). In 1916, he went to Russia to make a study of the commercial, industrial and financial conditions there for the Guaranty Trust Company of New York City, and was returning in March, 1918, when he was taken prisoner in the Åland Islands by the Germans. On Oct. 22, 1918, he was released, and arrived in the United States on November 10. In 1921, he was made manager of the Peking, China, branch of the Asia Banking Corporation with headquarters in New York. While on the way to San Francisco from Shanghai, on board the steamship *President Lincoln*, he died of pneumonia, Feb. 6, 1924.

EMMET, WILLIAM LEROY (1859-). An American electrical engineer and inventor,

born at New Rochelle, N. Y. He graduated from the United States Naval Academy in 1881, left the navy in 1883, but rejoined it during the Spanish-American War. He was with the General Electric Company from 1892. He made important inventions in steam turbines, received the Edison medal in 1919, and the Elliott Cresson medal in 1920. He was a member of the Naval Consulting Board in 1915, and chairman of the committee on submarines. He wrote *Alternating Current Wiring and Distribution* (1894), and contributed articles to the technical magazines on electrical and mechanical subjects.

EMMONS, WILLIAM HARVEY (1876-). An American geologist, born at Mexico, Mo. He was graduated at Central College in 1897, and received his Ph.D. at the University of Chicago in 1904. After serving as an aid in the United States Geological Survey during 1904-06, he returned to the University of Chicago, where he remained until 1912, having been advanced to the associate professorship of economic geology in 1909. After that time he was professor of geology and head of the department at Minnesota, and director of the Minnesota State Geological Survey. His principal investigations have been concerning a genetic classification of minerals, the ore deposits of various mining districts in Nevada, Montana, Colorado, Maine, and New Hampshire. He has published important reports in the United States Geological Survey series, on regionally metamorphosed ore deposits and the segregated veins, as well as petroleum geology. He served on the United States Geological Survey as assistant geologist during 1906-10 and as geologist, 1910-15, and was, besides, an associate editor of *Economic Geology*.

ENELOW, HYMAN GERSON (1876-). A Russo-American rabbi born in Russia, and educated at the universities of Chicago and Cincinnati, and the Hebrew Union College, Cincinnati. He became rabbi of Temple Emanu-El, New York, in 1912. During the War he served overseas as commander and general field secretary of the Jewish Welfare Board (1918-19). Among his works may be mentioned: *Aspects of the Bible* (1911); *The Jewish Life* (1915); *The Synagogue in Modern Life* (1916); *The Faith of Israel* (1917); *The War and the Bible* (1918); *The Adequacy of Judaism* (1920); *The Jew and the World* (1921).

ENEMY ALIENS. See **UNITED STATES, History.**

ENGEL, CARL (1883-). An American musicologist and composer, born in Paris. While studying philosophy and literature at the University of Strasbourg, he also pursued the course in music with Professor Jacobsthal. In Munich, he studied composition with L. Thuille and musicology with Professor Sandberger. He came to the United States in 1905, where he soon became known as an ardent advocate and exponent of futurism, contributing to American and English periodicals. From 1909 to 1922 he was editor and musical adviser for the Boston Music Company. In 1922, he succeeded O. G. Sonneck as chief of the Music Division of Library of Congress. His compositions, all

ultra-modern, consist of smaller pieces for piano, piano and violin, and songs. He is the author of *Alla Breve: From Bach to Debussy* (1921).

ENGEL, EDUARD (1875-). A German writer born at Stolz in Pomerania. He studied Sanskrit and medieval languages at the University of Berlin, but later devoted himself to modern literature, especially German. He edited a selection of *Byrons Tagebücher* (1904), and wrote on the Shakespeare-Bacon problem, *Shakespeare-Rätsel* (1904). His later works are: *Geschichte der deutschen Literatur* (1906); *Geschichte der deutschen Literatur des 19. Jahrhunderts und der Gegenwart* (1908); *Goethe, der Mensch und das Werk* (1911); *Deutsche Stilistik* (1911); *Deutsche Meisterprosa* (1912); *Ein Tagebuch: 1914-19* (1920); *Die Weisheit Goethes* (1920). He later edited a popular history of German literature and a popular edition of Goethe's works.

ENGELHARDT, EMIL (1887-). A German clergyman and writer who was born in Nundorf. Most of his works are concerned with the cultural position and future of Germany, among them being: *Die Zukunft des Auslandsdeutschtums* (1916); *Auf deutschen Vorposten* (1916); *Fichtes Erziehungsgedanken und die deutsche Volkshochschule* (1918); *Tat und Freiheit, ein Fichtebuch* (1918); *J. G. Fichte, ein deutscher Mensch und Denker* (1919); *Fichtes Briefe an Braut und Gattin* (1920); *Erlöser Liebe* (1920); *Minne und Liebe* (1920); *Rabindranath Tagore* (1921).

ENGERT, T. JOSEPH (1882-). A German professor of philosophy and pedagogy. Since his debut with *Der naturalistische Monismus Haeckels* (1907), he has written a number of works dealing with religious problems and with the War, among them, *Vom Sinn des deutschen Krieges* (1916).

ENGLAND, CHURCH OF. This denomination is represented in the United States by the Protestant Episcopal Church. It is the established church of England, and the King of England is the supreme governor, with the right to fill vacant archbishoprics and bishoprics. For administrative purposes the country is divided into two provinces, the Convocation of York and the Convocation of Canterbury, each under the control of an archbishop. In 1914 Parliament provided for the disestablishment of the church in Wales, which was delayed on account of the War until Mar. 31, 1920. Under the Church Enabling Act of 1919 a National Assembly of the Church was established, to deliberate on all church matters except its spiritual doctrines and the duties of the ministry. The act carried with it the power to establish three houses composed of bishops, clergy, and laity, to which members were elected in 1920. The membership of the church fell from 2,359,599 in 1915 to 2,220,194 in 1923, and the number of pupils in the Sunday schools from 2,541,000 to 2,233,111. The income from voluntary offerings in 1914 was between £7,000,000 and £8,000,000, as compared with an income in

1923 of \$6,862,948. The number of clergymen remained about the same. A controversy arose in the church during the period, over the action of two African missionary bishops in joining and taking communion with nonconformist missionaries at Kikuyu in 1914. Accusations of heresy were made, but the missionaries were upheld by the report in the following year of the Central Consultative Body of the Church, to which the matter was referred.

ENGLAND, GEORGE ALLAN (1877-). An American author born at Fort McPherson, Neb. He was graduated from Harvard in 1902, and a year later published *Underneath the Bough* (1903). Other works of his include: *The Story of the Appeal* (1914), *The Air Trust* (1915); *The Great Crime* (1917); *Their Son* (1919); *The Flying Legion* (1920).

ENGLISH HISTORY. See GREAT BRITAIN.

ENGLISH LITERATURE. See LITERATURE. ENGLISH AND AMERICAN.

ENNEKING, JOHN JOSEPH (1840-1916). An American landscape painter. He was born in Munster, Ohio, and studied in Munich and chiefly with Bonnat and Daubigny in Paris. In 1876 he settled in Boston, where he was closely associated with George Fuller and George Inness. Especially after 1882 his art became increasingly subjective. He had a facility in catching and reproducing atmospheric conditions in his canvases. This facility is illustrated in his treatment of November twilights and forest scenes. Ralph Davol said of him, "Enneking was a modern romanticist combining qualities of the impressionist, luminist and tonalist. He divided tones into their primary elements and obtained color vibrations by laying on fresh paint in gentle juicy pounces with a narrow brush, carefully tucking in the edges of his strokes to preserve a delicate, volatile play of light." He is represented in the Museums of Worcester and Boston and in many New England private collections.

ENTOMOLOGY, ECONOMIC. The importance of insect control in the United States and the prevention of the enormous loss which the country pays each year as tribute to insect supremacy was recognized by the Federal and State governments in the making of liberal appropriations. Inasmuch as the free productive agricultural land was practically exhausted, the country must depend upon reclamation work for an extension of crop area, on a more intensive agriculture, and on elimination of the loss by insect pests and plant diseases in order that production may keep up with the increase in population. The work in economic entomology has kept pace with the sciences in invention and in the adaptation of scientific knowledge to its use. The chemist, engineer, electrician, and other scientists have been called upon to aid in solving the problems of insect control. The work accomplished in the United States has laid a firm foundation. To a number of the leading educational institutions of the country, which have given courses that have prepared the student in the sciences that are fundamental in the work and the technical knowledge, belong much of the credit for what has been accomplished.

The losses caused annually by insect pests in the United States are estimated by entomological authorities to reach the enormous sum of \$2,000,000,000. While many factors complicate the problem, it is the general conclusion that in an

average year with no unusual attack the loss caused to crops is about one-tenth of the total production. The indirect losses caused by insect-borne diseases reach a large sum. The loss of productive labor in the United States through the sickness and death resulting from malaria is figured at \$100,000,000, or more, and from all insect-borne diseases at over \$350,000,000. With the introduction of new pests from abroad and with the rise and spread of other native insects, this loss may be expected to increase unless the status quo can be maintained through the application of preventive and control measures by the hand of man.

During recent years new pests of vast economic importance have been unwittingly introduced from abroad and become established, including the pink bollworm, European corn borer, Japanese beetle, Oriental peach moth, pine shoot moth (*Evetria buoliana*), European earwig, European red mite (*Paratetranychus pilosus*), satin moth (*Stilpnotia salicis* L.), and others. A second class, consisting of earlier introduced pests which have continued to spread and increase in importance includes the gipsy moth, brown-tail moth, cotton boll weevil, alfalfa leaf weevil, Argentine ant, Mexican bean beetle, pear thrips, and citrus blackfly. Others, which may be referred to as a third class, have risen and assumed alarming prominence, such as the potato leaf hopper, beet leaf hopper, pea moth, apple red bugs, and camphor thrips, and the fruit-tree leaf roller. To a fourth class belong untold numbers of pests of no less importance that are threatening to enter our borders, of which the Mediterranean fruit fly is the most important. Other pests, such as the codling moth, San José scale, Hessian fly, chinch bug, spring grain aphid, corn rootworm, bollworm, cotton leaf worm, army worm, the grasshopper, cabbage worm, Colorado potato beetle, citrus white fly, grain weevil, and others, continue their ravages, and, though they may at times be checked by climatic conditions and natural enemies, necessitate eternal vigilance on the part of the American agriculturist.

In combating these pests the entomologists have adopted strategic means of every kind, and the resulting advance in preventive and control measures has been epoch making. Resorting to legislative means, Congress enacted the Federal Plant Quarantine Act of Aug. 20, 1912, which immediately became effective as to certain quarantines, and is administered by the Federal Horticultural Board, consisting of five members appointed by the Secretary of Agriculture. A quarantine against insect pests and diseases of plants from abroad has been established and maintained, inspectors having been stationed at every port of entry by land and sea. It would not be surprising, with the opportunities afforded, if, in spite of this vigilance, now and then a foreign pest should make its entry undetected, for they are often exceedingly elusive in the method of their introduction. However, with the exception of the pink bollworm, which gained entrance from Mexico before its lodgment there was discovered, no important pest is known to have become established in the United States since the enforcement of the act. Not the least important work of that Board are the quarantines established and maintained within the United States against the spread of a number of our most important pests. The investigational and control work is carried on

by the Federal government through the Bureau of Entomology and the Horticultural and Insecticide and Fungicide Boards. In the States the work is conducted by the experiment stations, State entomologists, and, in several instances, by crop pest commissions. The Federal Bureau of Entomology, of which Dr Leland O. Howard is chief, administers the work through its several divisions. In 1924 it had 83 field stations in 32 States and Territories and three foreign countries. The State experiment stations have conducted investigations on hundreds of projects and have maintained vigilance and afforded local aid in control. The interstate spread of pests has been prevented to a large extent through State regulations requiring that nursery stock be free from infestation, and these are enforced by rigid State inspection.

Pink Bollworm. In November, 1916, the occurrence of the pink bollworm in the Laguna district of Coahuila, Mexico, within 200 miles of the Texas border, was discovered, and an embargo was placed upon the importation of Mexican cotton. It was found the following year that the larvæ had been introduced in carloads of cotton seed shipped from Mexico before the quarantine in November, 1916, infestations being found at points in several counties in Texas and Louisiana. The infested areas were at once quarantined, and eradication work was pressed with vigor under appropriations by Congress, apparently with success, as the last pink bollworm in the United States, aside from the Mexican border, was found in 1922. In order to prevent its entrance, houses have been erected at ports of entry on the Mexican border for the fumigation of freight cars from Mexico where they may have served as carriers of cotton and cotton seed, and all cotton from abroad has been fumigated in large cylinders with hydrocyanic acid gas in vacuum in order to destroy any larvæ present. The pest has been introduced into Brazil, as well as Mexico, with seed, it being estimated to have caused a loss of \$27,500,000 in Brazil in 1918. It was introduced into the Hawaiian Islands about 1908 and was discovered in Porto Rico in 1921, where it has spread throughout the island. This moth, which originated in India and is now a source of great loss in Egypt, whence it has spread to other cotton-producing countries, and which constitutes one of the greatest menaces that have ever come to the American cotton industry, had not previously been known to occur in America, although prevalent in practically all of the other cotton-producing regions of the world, in all of which it has caused widespread destruction.

European Corn Borer. Late in the year 1917 the widely distributed European and Asiatic pest *Pyrausta nubilalis* Hubn., a moth whose larva is a borer, was discovered to have become established in an area approximating 100 square miles in several counties in eastern Massachusetts, where it caused serious injury to corn and particularly to sweet corn. The investigations which have followed show that the pest had been introduced from Europe in broom corn. This borer attacks all of the corn plant above ground except the leaf blades, its most serious injury being caused by the second brood larvæ, a large percentage of which, after hatching, immediately enter the ear, their injury resembling that of the well-known corn earworm.

The pest winters as a partly grown larva in the stems of plants, finishing its feeding and pupating in its burrow in the spring. In addition to corn, it attacks large-stemmed weeds, dahlias, gladiolus, and other cultivated plants. It has spread from Massachusetts into New Hampshire, and infestations have since been found in the vicinity of Schenectady in the Hudson Valley in New York, in northeastern Pennsylvania and southwestern New York, in Ohio in the vicinity of Lake Erie, and in southern Ontario. The destruction of cornstalks to a point below the ground level is an important measure in checking its ravages.

Japanese Beetle. The green beetle *Popillia japonica* was introduced from Japan with nursery stock and became established near Riverton, N. J., where it was discovered in the summer of 1916. The beetle attacks the foliage of many kinds of fruits, vegetables, and ornamental plants, and the larvæ feed on the roots of plants and on decaying vegetable matter. Investigations of its biology and control have been conducted, and a quarantine has been established to aid in preventing its dissemination. It has, however, continued to spread, and by the fall of 1922 an area of 773 square miles had become infested.

Oriental Peach Moth. The Oriental peach moth, which attacks the terminal twigs of the peach, plum, and cherry, stunting their growth, and also infests the fruit of the peach, was first discovered in the District of Columbia in 1916 and is known to have spread as far north as Connecticut. It is supposed to have been introduced with flowering cherry trees from Japan.

Pine Shoot Moth. The destructive pine shoot moth was found in 1914 to have been introduced from Europe and to have become established in 10 localities in three States from Massachusetts to Pennsylvania, and the following year it was recorded from 20 localities in nine States, in none of which except on Long Island had it lasted for longer than two years.

Gipsy Moth. The gipsy moth was introduced by accident from Europe into Massachusetts about 1861. Work against it has been carried on since the early '90's, at first by the State of Massachusetts alone and since 1901 by the Federal government and the States, but it has continued its spread. Encouraging results have, however, been obtained in work with native and introduced parasites. Investigations have shown that the natural spread of this moth, the female of which is wingless, is accomplished mainly through young caterpillars' being carried by high winds. The pest in 1914 was entering the eastern border of New York State in the course of its spread, and it was proposed to establish a barrier zone some 25 miles wide extending from Long Island Sound northward and up the Hudson Valley to the Canadian border. More recent accidental introductions of the pest on nursery stock have been successfully eradicated, except that of 1910 in New Jersey, where work was under way in 1924.

Brown-tail Moth. The brown-tail moth is another defoliating pest which was accidentally introduced into the United States, near Boston, from Europe. Since its introduction, about 1892, it has spread as far north as Nova Scotia and covers practically all of New England. The moth takes its name from the tuft of golden brown hairs at the tip of the abdomen. In the early fall the young caterpillars spin tents at

the end of twigs, incorporating leaves, in which they spend the winter, these tents being very conspicuous after the leaves fall. In the spring the caterpillars leave the tents and feed on the foliage until June, when their development is completed. In addition to its injury from defoliation, it is a source of great annoyance from the hairs of the caterpillar, which break off at molting time and, being carried through the air, produce a painful rash. Its control is aided by cutting off and removing the tents in winter, by the application of arsenate of lead, and by parasites, many of which also attack the gipsy moth.

Cotton Boll Weevil. The boll weevil, which entered Texas in the vicinity of Brownsville about 1892, has continued its spread and by 1924 had occupied practically all of the old cotton-growing area of the United States. Appropriations made by Congress for investigations and control work with it have amounted to nearly \$1,500,000. As a result of extensive investigations for its control, a highly toxic, finely divided calcium arsenate has been prepared, which is applied in a dust with high powered dusting machines constructed for the purpose. Its application in a dust is quite generally employed and in molasses to a less extent. A new method developed in Florida which combines dusting and the removal of the squares until the weevils have largely emerged from hibernation, followed by dusting, was being tested in several States. In 1913 it was discovered that a wild cotton-like plant which grows in canyons in Arizona is the host plant of a new variety of the cotton boll weevil. The danger from this form lies in the possibility of its spreading into the cotton fields in the irrigated districts of the vicinity and becoming a destructive pest.

Alfalfa Leaf Weevil. This European insect, accidentally introduced into the United States and first discovered in Utah in 1904, continued to spread and by 1924 had become the source of considerable injury in Colorado, Idaho, and Wyoming, as well as in Utah. Appropriations by Congress led to control work, in which particular attention was given to the introduction of parasites, as high as 25 per cent of the weevil larvæ having been killed in 1916 by the increase of parasites introduced from Europe.

Argentine Ant. This enemy of field crops, fruits, stored products, household supplies, etc., which was first discovered in the United States at New Orleans in 1891, continued to spread, and colonies were known to be established as far distant as Alabama and Texas.

Mexican Bean Beetle. The bean beetle, which originated in Mexico but has occurred endemically in the southwestern United States for 75 years, appeared near Birmingham, Ala., in July, 1920, spread rapidly, and became of great economic importance as an enemy of beans of all kinds through its defoliation of the plants.

Pear Thrips. The pear thrips, which for many years has been the source of serious injury to deciduous fruits through attacking the blossom, particularly of pears, prunes, and cherries, in the Santa Clara Valley, Cal., and later appeared in British Columbia, was discovered in New York State in 1911 and has become of considerable importance in the Hudson River Valley fruit belt. In 1915 it appeared in Maryland and was a source of injury to an orchard in the vicinity of Baltimore.

Mediterranean Fruit Fly. This destructive enemy of no less than 80 different subtropical fruits and vegetables, especially citrus fruits and particularly the orange, was first discovered in Hawaii on the Island of Oahu in 1910. Since that time it has increased rapidly and spread into other islands. Control work has led to the introduction of a number of parasites, several of which are responsible for a considerable reduction in its infestation. This fruit fly has been the most serious drawback to fruit growing in the countries where it is established, its introduction into Bermuda many years ago having resulted in the destruction of the fruit growing industry of that island. In order to combat and aid in preventing its introduction into the United States on the mainland, several emergency appropriations have been made by Congress, and all means for prevention are being employed by the inspection service of the Federal Horticultural Board, the Plant Quarantine Act having made it possible to establish and maintain a quarantine against it.

Codling Moth. Investigations of this insect, which is responsible for the greater part of our wormy apples and pears, causing a loss estimated at \$20,000,000 annually, led to the dissemination of information as to the proper dates to apply arsenicals.

Peach Borer. This destructive borer in the lower trunk of the peach tree in 1924 was being effectively controlled by the use of paradichlorobenzene placed about the trunk and kept covered with soil for several weeks. The gas escaping from the chemical enters their galleries in the tree and destroys the borers.

Other Insects. Among other insects which have been introduced or become of great economic importance are the European red mite, first discovered in Canada in 1915 and a source of injury through its attack upon the leaves of the apple, plum, etc., in the northeastern United States; the European earwig, which first appeared in Rhode Island in 1911 and in Washington State in 1915 and is a source of injury to garden plants and flowers; the popular defoliating satin moth, from Europe, which was first discovered near Boston, Mass., in July, 1920; the Australian tomato beetle, first observed in Mississippi in 1921; the camphor thrips, first discovered in Florida in 1912; the pea moth, which is increasing in importance in Wisconsin; the sweet potato weevil, which was first discovered in this country in 1875 but which began to spread and increased in importance about 1920; the fruit-tree leaf roller, which has increased in importance due to its resistance to insecticides; the potato leaf hopper, which causes tipburn of the potato, and others.

Control Measures. A notable advance has taken place in the knowledge of biological, insecticidal, mechanical, and other means of insect control. Search has been made and parasites of a considerable number of pests have been discovered and introduced from foreign lands. New insecticides have been discovered, and others have been adapted for more efficient control. Notable among the new insecticides is paradichlorobenzene, which has been successfully used in the control of the peach tree borer. The lubricating oils have been found to form emulsions that are highly effective against scale insects on citrus, the San José scale, etc. New forms of arsenicals have been perfected,

notably calcium arsenate in dust form, as employed in combating the boll weevil, Bordeaux oil emulsion spray for citrus insects, etc. Nicotin applied in a dust form has proved very effective as a means of control of the walnut aphid and a large number of other pests. Borax has been found to be effective, economical, and practical in the destruction of fly larvæ in horse manure, and hellebore is also effective for this purpose. Corrosive sublimate has been found to be highly effective against root maggots. New methods of preparation and application of cyanide gas for combating citrus pests have been developed. New mechanical developments include tests of the use of the airplane in applying dusts for control of the boll weevil, gipsy moth, etc. New machines for the application of sprays and new hand and power dusters have been invented or improved, and numerous mechanical devices have been developed.

Apiculture. Investigations of bee diseases, the greatest handicap with which the beekeeper has had to deal, resulted in a number of discoveries of great importance. A disease of the brood which has often been mistaken for one of the foul broods and to which the name "sacbrood" is given has been found to be due to a filterable virus. The deadly Isle of Wight disease of the adult bee, occurring in Great Britain and on the Continent, was discovered to be caused by the mite *Acarapis woodi* in the tracheæ, and an embargo has been placed upon the importation of bees in order to prevent its introduction into the United States.

ENVER PASHA (1881-1922). A Turkish soldier, born at Abana. He dabbled in the Young Turk movement for his own ends, and sought to bring about a revolution (1908) in the Macedonian mountains against the Sultan, thus bringing into effect the old constitution of 1876. In spite of his victorious entry into Constantinople and the reduction in the Sultan's revenues and property, Enver Pasha received only a position as military attaché in Berlin, where he became quite pro-German. During the Italo-Turkish War he took command of Benghazi and wrote a book on the period called *Tripoli*. In February, 1913, he brought about a coup d'état during the peace negotiations. He shot the War Minister, Nazim Pasha, and shared the power of the government with the Young Turk Committee. In January of the following year, he appointed himself major-general and minister of war.

Upon the outbreak of the War in 1914, Enver assumed complete control, allied himself with the Germans, and when the collapse of Turkey came he fled to Germany. He was condemned to death in 1919, but with the help of friends, managed to remain hidden, and later to escape to Russia, where it was reported that he became imbued with an idea to recover the Ottoman Empire in mid-Asia. However, both Constantinople and Moscow were against him, and in a skirmish with the Bolsheviks in July, 1922, he was shot and killed.

ENZYMES. See CHEMISTRY, PHYSICAL.

EPIDEMIC. See INFLUENZA.

EPILEPSY. Experience with epilepsy in soldiers during the War confirmed the belief that all manifestations which come under this head may have a common origin; yet it became increasingly difficult to distinguish between primary and secondary or symptomatic epilepsy. Cranial injuries were found able to give rise to

any or all of the clinical expressions of the disease; in some cases the malady does not appear until more than a year after the injury. Nor did it appear necessary for the sufferer to have a strong hereditary predisposition to the disease; as a matter of fact the medical selection of troops automatically eliminated many degenerate individuals.

Within the years 1914-24 attempts were made to bring epilepsy within the domain of psychoanalysis on the ground that the disease had a subconscious mental factor. Dr. Pierce Clark of New York published many articles to show that these patients are sometimes improved by psychoanalysis. The most sensational advance in connection with epilepsy was the introduction of the synthetic drug luminal, allied in composition with veronal. The public was cautioned not to expect too much from this innovation, but it seems certain that it could very largely replace bromides with none of the severe constitutional effects of the latter. The dose, which is small, need not be increased to hold its effect; indeed, it is too powerful to warrant any attempt to increase it. Since 1920 this drug was very thoroughly tried out; most reports were distinctly favorable. It may also be used to spare bromides and thus diminish the likelihood of bromide intoxication.

EPIRUS, NORTHERN. See ALBANIA.

EPISCOPAL CHURCH. See PROTESTANT EPISCOPAL CHURCH.

EPSTEIN, JACOB (1880-). An American sculptor, active chiefly in London. He studied with George Gray Barnard in New York and at the Ecole des Beaux Arts in Paris. He was an experimentalist in style in his early work, much of which was purely abstract in character. In his sculptured portraits he treated each sitter in a style corresponding with his character. Of extraordinary technical resourcefulness, he follows the traditions of dramatic sculpture by working with ridges and bosses rather than by the architecture of his planes. He is peculiar in the vehement violation of actuality in the individual head. His principal works include the monument to Oscar Wilde in the cemetery of Père Lachaise, Paris; 18 nude figures outside the office of the British Medical Association; "Christ," a very radical conception which caused much controversy; "The Sun God"; a series of powerful portrait heads, including Admiral Lord Fisher (Imperial War Museum, London); the bronze "American Soldier," Metropolitan Museum, New York; several versions of Mrs. Epstein; the Duchess of Hamilton, and a number of others in the collection of John Quinn, New York. Consult the monograph by B. Van Dieren (London, 1920).

ERB, NEWMAN (1850-1925). An American railway official, born in Breslau, Germany. In 1853, he came with his parents to the United States. He was educated privately and in the public schools of St. Louis. For several years he practiced law, serving as general attorney for several railroads. From 1886 to 1898, he was president of the Western Telegraph Company. He was president and receiver of several important railroads in the West and South. He constructed and was president of the St. Louis, Memphis and Southeastern Railroad and was president and director of the Wisconsin Central Railroad in 1908-09. He was president of the Minneapolis and St. Louis Railroad and the Iowa Central Railroad for several years and

was a director and official in many important corporations, chiefly connected with railways.

ERDMAN, CHARLES ROSENBURY (1866-). An American theologian born at Fayetteville, N. Y., and educated at Princeton University, and the Princeton Theological Seminary. He was ordained in 1891, and after serving various pastorates, returned to the seminary at Princeton as professor of practical theology in 1906. He has been a delegate to Presbyterian conventions and world assemblies, and is the author of *The Ruling Elder* (1904); *Sunday Afternoons with Railroad Men* (1907); *Coming to the Communion* (1912); *Gospel of John, an Exposition* (1916); *The Gospel of Mark, an Exposition* (1917); *The General Epistles* (1918); *The Acts* (1919); *Matthew* (1920); *Luke* (1921).

ERDMANN, BENNO (1851-1921). A German philosopher (see VOL VIII). The veteran Kantian scholar died in January, 1921. His last work, *Grundzüge der Reproduktionspsychologie* (1920), concerned itself with the movement of thought and imagination.

ERIE. A manufacturing and summer resort city of Pennsylvania, and a port on Lake Erie. The population rose from 66,525 in 1910 to 93,372 in 1920, and to 112,571, by estimate of the Bureau of the Census, for 1923. Presque Isle Peninsula, including about 2500 acres of land which formed a protecting arm before the harbor, was set aside as a State park by the State of Pennsylvania, and various plans were proposed for developing it. City planning and zoning were highly developed. A grade crossing programme entered into by the city and the railroads was to include the erection of a new union dépôt. A stadium seating 25,000 was under construction in 1924, by public subscription. In 1921 a high pressure reservoir was built; in 1924 an interceptor sewer with a disposal plant was being constructed.

ERITREA. An Italian colonial possession in Africa on the west coast of the Red Sea. Area, about 45,800 square miles; native population in 1920, 402,793. Europeans numbered 4681; of these 4283 were Italian. Asmara, the seat of government, had 14,711 inhabitants, 2500 of them Europeans; Massawa, the leading port, 2645, with 360 Europeans. The export trade by sea comprised dried hides, palm-nut seeds, tinned meats, salt, mother-of-pearl, conch shells, flaxseed, rubber, and tanning materials; the sea-borne import trade, wines, cotton and cotton goods, mineral oils, cement, sugar, coffee, fats, and soap. Imports in 1912 were valued at \$3,637,000; in 1919, \$9,120,000, based on an average value of the lira at \$0.114; in 1921, \$4,730,000, on a lira value of \$0.04. Exports for 1912, 1919, and 1921 were \$1,750,000, \$4,674,000, and \$1,204,000. The transit trade in 1921, principally with Abyssinia, was valued at \$1,112,618 in imports and \$1,132,840 in exports. At Massawa 204,400 tons of shipping entered in 1912, and in 1921, 354,256 tons. After 1912, 63 miles of railway were completed from Asmara to Cheren. In 1922 work was under way on a line of 54 miles from Cheren to Agordat. At Massawa and Assab wireless stations were established to keep the colony in constant communication with Italian Somaliland and Italy. For 1922-23 the colonial budget balanced at 27,548,737 lire, or \$1,377,400 at the average rate for 1922 of \$0.05. In 1912 governmental costs were about \$1,250,000. The railways

were opening up a cotton area computed at 100,000 acres. Efforts to attract Italian settlers proved unsuccessful, because the highlands, the only areas suitable for European colonization, were already well filled by Abyssinians. The colony was not yet self-supporting.

ERIVAN, ARMENIAN REPUBLIC OF. See ARMENIA

ERMAN, HEINRICH (1857-). A German jurist, born in Berlin, and educated at the universities of Leipzig and Berlin. In 1883, he was appointed professor at Lausanne, and was subsequently professor of Roman law in Geneva. He was made honorary professor at Lausanne in 1902, and later at Munster-in-Westfalen. His written works include contributions to periodicals and the following books: *Zur Geschichte der römischen Quittungen und Solutionsakte* (1883); *La Restitution des frans de procès en droit romain* (1892); *Servus vicarius, l'esclave de l'esclave romain* (1896); *Recht und Prator* (1903); *Bedeutung der Bodenreform für eine aufstrebende Stadt* (1907); *Behandlung der Aktionen in den nachklassischen Rechtsbüchern* (1908); *Grundzüge für ein Kriegerheimstätten-Gesetz* (1916).

ERMATINGER, EMIL (1873-). A Swiss author and professor at the technical high school of Zurich, born at Schaffhausen. He studied law and philosophy at Swiss universities, but later devoted himself to teaching and writing. He is the author of a volume of verse (1900), and of several novels, among them *Weggefährten* (1902) and *Der Weg ins Leben* (1909), but he is best known for his critical, biographical and historical works, which are: *Antike Lyrik in modernem Gewande* (1898); *Die Weltanschauung des jungen Wieland* (1907); *Gottfried Kellers Leben, Briefe und Tagebücher* (1915); *Die deutsche Lyrik in ihrer geschichtlichen Entwicklung von Herder bis zur Gegenwart* (1921). He is also the editor of the complete works of Gottfried Keller.

ERNLE, ROWLAND EDMUND PROTHERO, first BARON, (1852-). An English economist, born at Clifton-on-Teme. He was graduated from Balliol College, Oxford, in 1873, and was connected with that university as fellow and proctor until 1884. In 1913, he was appointed a member of the Royal Commission on Railways and in 1915-16 was a member of important committees on the production of food. From 1894 to 1899, he edited the *Quarterly Review*, and from 1916 to 1919 was president of the Board of Agriculture. His writings include: *Pioneers and Progress of English Farming* (1887); *The Psalms in Human Life* (1903); *The Pleasant Land of France* (1908); *English Farming, Past and Present* (1912).

ERNST, PAUL (1866-). A German writer of essays, dramas and fiction, born at Elbingen. He studied at the universities of Göttingen, Tübingen, Berne and Berlin. In his first efforts, the one-act plays *Lumpenbagasch* and *Im chambre séparée* (1898), he was influenced by the naturalism of Arno Holz, but later found himself in the volume of poems *Polymeter*, the two one-act tragedies *Wenn die Blätter fallen* and *Der Tod* (1899), and the volume of fiction, *Sechs Geschichten* (1900). After a sojourn in Italy he published some translations, *Altitalienische Novellen* (1902), selections from *Des Knaben Wunderhorn* and a special edition of Arnim's *Isabella von Ägypten* (1903). He has since written a number of novels—*Die Prinzessin des*

Ostens, Der schmale Weg zum Glück (1903), *Der Tod des Cosimo* (1912); *Die Hochzeit* (1913); *Saat auf Hoffnung* (1915), *Die Taufe* (1916), *Der Nobelpreis* (1917)—a volume of short stories, *Komödiantengeschichten* (1920), and a drama. *Preussengeist* (1915) His book of essays, *Der Weg zur Form* (1906), and *Der Zusammenbruch des Idealismus* (1919), attracted much attention

ERSKINE, JOHN (1879-). An American university professor of English (see Vol. VIII). He published: *The Moral Obligation of the Intelligent, and Other Poems* (1915); *The Shadowed Hour* (1917); *Democracy and Ideals* (1920); *The Kinds of Poetry* (1920); *The Literary Disciple* (1923) In addition, he has edited several publications and held the educational directorship of the American Expeditionary Forces.

ERVINE, ST. JOHN GREER (1883-). An English dramatist and novelist, born at Belfast, Ireland. His first play, *The Magnanimous Lover* (1907), possessing a distinctly moral flavor, was produced at the Abbey Theatre, Dublin, in 1913. Two years later he was manager of the same theatre. During the War he was a lieutenant in the Royal Fusiliers and was wounded (1918) in France. He is the writer said by Arnold Bennett to be "probably unequalled by any other playwright" in England, who had in his work "combined great skill, fine ideas and perfect sincerity with immense popular success." He wrote the following plays, all of them produced either in Dublin, London, or New York: *Mixed Marriage* (1910), a four-act play; *Jane Clegg* (1911), produced at the Gaiety Theatre, London, in 1912, and later in New York; *John Ferguson* (1914); *Mary, Mary, Quite Contrary*, in which Mrs. Fiske appeared in New York in 1923; *The Wonderful Visit* (with H. G. Wells). Among his other publications are: *Four Irish Plays*; *The Ship*; *Eight o'Clock, and Other Stories* (short stories); four novels, *Mrs. Martin's Man*, *Alice and a Family*, *Changing Winds*, *The Foolish Lovers*; a political study, *Sir Edward Carson and the Ulster Movement*, and *The Lady of Belmont* (1924), a play in five acts

ERZBERGER, MATTHIAS (1875-1921). A German politician, born at Butthausen (Württemberg). He began his career as a school-teacher, then was a journalist, becoming a member of the staff of the *Deutsches Volksblatt* (Stuttgart) in 1896. His political career began in 1903, when he was elected to the Reichstag as representative of the Catholic Centre party. During the War he at first made extravagant efforts to increase German annexations, but later became just as active in furthering peace negotiations. It was he who instigated the "Peace Resolutions" drawn up by the Reichstag in 1917; and when, in 1918, he succeeded Bethmann-Hollweg as Secretary of State, he conducted the Armistice negotiations, and signed the agreement on November 11. Upon becoming Finance Minister of the Reich in 1919, his worst troubles began. On account of a legal controversy with Dr. Helfferich, the Nationalist leader, he was forced to resign; and, although he was returned to the Reichstag in 1920, he abstained from politics for a time. This same year he published a pamphlet justifying his war policy, but this did not overcome the animosity of his opponents, the Conservatives and National Liberals who criticized him

not so much for his peace negotiations as for his financial policy, which hit capital and landed interests. His supporters were the Catholic working classes. The culmination of the attacks upon him was his assassination on Aug. 26, 1921.

ESENWEIN, JOSEPH BERG (1867-). An American editor, born in Philadelphia, and educated at Albright College, Millersville Normal School, Lafayette College, Richmond College and the University of Omaha. He was president of Albright Collegiate Institute in 1895-96, and in the following year held the position of educational director of the Y. M. C. A. at Washington Heights, New York City. After a year of foreign travel, he became professor of English in the Pennsylvania Military College at Chester, subsequently giving up teaching (1903) to become manager of the *Booklovers' Magazine*. Two years later he was made editor and manager of *Lippincott's Magazine*, a position which he held until 1914. In 1915 he became editor of *The Writer's Monthly*, Springfield, Mass. He is known both as a lecturer and writer. His published works, besides articles contributed to Charles Dudley Warner's *Library of the World's Best Literature*, include: *Songs for Reapers* (1895); *Modern Agnosticism* (1896); *Feathers for Shafts* (1897); *Writing the Short Story* (1909); *Lessons in the Short Story* (1910); *Short Story Masterpieces* (1912); *Writing the Photoplay* (1913. Rev. ed., with Arthur Leeds, 1919); *The Art of Public Speaking* (1915), *Writing for the Magazines* (1916); *Children's Stories and How to Tell Them* (1917); *Russian Short Story Masterpieces* (2 vols, 1919).

ESHER, REGINALD BALIOL BRETT, second Viscount (1852-). An English politician and author, born in London, and educated at Eton and Trinity College, Cambridge. He was a member of Parliament from Penryn and Falmouth (1880-85), secretary to the Office of Works (1895-1902), chairman of the War Office Reconstitution Committee (1904), a permanent member of the Committee of Imperial Defense (1905-), and from 1909 to 1913 was chairman of the Territorial Force Association of the City of London. King Edward VII appointed him one of the editors of *The Correspondence of Queen Victoria* (1907). Among his publications are: *Footprints of Statesmen* (1892); *Today and To-morrow* (1910); *Influence of King Edward*, Essays (1914); *After the War* (1918); *The Tragedy of Lord Kitchener* (1921).

ESPERANTIDO. See INTERNATIONAL LANGUAGE

ESPERANTO. See INTERNATIONAL LANGUAGE

ESTHONIA. A republic on the Baltic Sea, made up of the former Russian government of Estland, the northern part of Livland, the islands Saaremaa, Hiiumaa, and Muhumaa, and parts of the Petseri district of the Pskov government and the Gdowski district of the Petrograd government. Esthonia became a republic on Feb. 24, 1918, after the Bolshevik *coup d'état*. By treaty with Russia on Feb. 2, 1920, and by an agreement with Latvia, her sister republic to the south, Esthonia's political borders were extended to coincide with her ethnographic limits. The area is put at 18,000 square miles, and the population, according to the census of

1922, at 1,110,538. Of these, 95 per cent were Esthonians and the rest Germans, Russians, Jews, Finns, Swedes, and Letts. The capital, Reval, had 160,000 in 1917, and in 1923, 126,543 inhabitants. Narva, the chief manufacturing centre, was credited with a population of 27,975. Five-sixths of the population were Lutherans, and the rest were Greek Orthodox and Roman Catholics.

Industry. The great proportion of the population was busied on the land. Up to the passage of the land reform bills of 1919, property was concentrated mostly in the hands of the Baltic barons and the clergy, of German descent; native Esthonians were merely farm hands or small peasant proprietors. By the bill of Oct. 10, 1919, an ambitious programme was projected for the almost complete confiscation of these large estates and their allotment among the peasants and soldiers. Some indemnity was provided for, but the basis was not to be the real value but the size of the land tax. By 1922 the report was that 22,000 additional small farms had been created, averaging 40 to 55 acres. Lack of capital for buildings and deterioration of farm stocks imposed almost insuperable difficulties on the realization of the programme. Of the total area of 10,851,500 acres, forest land, owned by the state, comprised 20.1 per cent; fields, 22.9; meadows, 24.5; pastures, 17.5; untillable land, 15. The acreage under various crops and the harvests of 1922 and 1923, compared with the average for five pre-war years, 1910-14, are given as follows:

Crops	PRINCIPAL CROPS				
	Area in acres		Production in thousands of bushels		
	1922	1923	1910-14 (average)	1922	1923
Rye	392,000	426,100	6,702	5,079	6,808
Oats	395,700	377,500	7,531	9,901	7,820
Barley ..	331,100	311,900	5,269	6,564	4,030
Wheat ..	52,200	36,100	257	748	397
Potatoes .	186,600	178,600	27,701	25,932	24,659
Flax and flaxseed	59,200	75,600	25,400 *	17,400 *	18,300 *
* Metric tons.					

Live stock in the country in 1922 numbered 192,200 horses, 505,810 heads of cattle, 261,040 swine, and 530,290 sheep and goats. There were textile, hemp and rope, paper, metal, and shipbuilding works, but up to 1923 these were languishing because of deterioration and lack of capital.

Trade. The following table shows that trade was improving. In 1920, exports were valued at \$17,544,278 and imports at \$19,931,218. The figures for 1922 and 1923 in detail were:

IMPORTS AND EXPORTS (Thousands of dollars)					
Imports			Exports		
	1922	1923		1922	1923
Foodstuffs	4,509	6,576	Foodstuffs	3,822	3,008
Textiles	2,064	6,933	Flax and cotton	4,589	6,438
Machinery and metals	1,467	6,639	Wood goods	2,549	4,049
Coal, ore, greases	1,182	2,252	Paper industry	1,169	1,711
Chemicals and drugs	382	1,931	Stone, earth	290	281
All others	6,834	2,369	All others	1,698	653
Total	16,438	26,700	Total	14,117	16,140

Principal countries of origin of imports (1923): Germany, 51.0 per cent; Great Britain, 19.7, Russia, 4.1, United States, 3.7; Sweden, 3.2. Principal countries of destination of exports (1923): Great Britain, 34.1 per cent; Germany, 10.7; Sweden, 10.0, Latvia, 8.1; Russia, 6.7, United States, 1.3.

By the Russo-Esthonian treaty, goods in transit for Russia were to be admitted unhampered by an import or transit duty. That this trade was

considerable may be adduced from the importation in 1920 of 24,012 long tons, through Reval and Narva, for Russia; 1921, 189,900 long tons; and 1922, 55,271 tons. These importations included salt, leather, paper, ironware, lead and copper goods, coal, and chemicals and drugs, mainly from Germany and Sweden. During 1922, 3172 vessels of 223,114 tons entered the Esthonian ports of Reval, Narva, Pernau, Port Baltic, Hapsal, Kunda, Arensburg, Loksa, and Rohukala. The total length of railways in 1922 was 971 miles, including 605 miles of Russian broad gauge and 366 miles of narrow gauge.

Education. Elementary education was free. In 1922 there were 1221 elementary schools, 221 higher schools, 70 gymnasias, several normal schools, a technical school at Reval, and a state university at Dorpat. The last, reopened in 1919, had, in 1921, 2775 students. The minority nationals, Germans, Russians, Swedes, and Letts, were guaranteed instruction in their mother tongues.

Finances. In 1922, expenditures were 5,510,300,000 Esthonian marks and the revenues 5,065,300,000 Esthonian marks. In 1923 the budget deficit was estimated at 700,000,000 Esthonian marks or about 10 per cent of the total expenditures of 6,775,000,000 marks; for 1924 it was estimated at 423,000,000 marks or 6 per cent of expenditures, which included 435,000,000 marks, about \$1,250,000 for payment of foreign debts. The Esthonian mark was worth 371 to the dollar in December, 1923. The foreign debt was about \$19,600,000, end of 1923, the United States holding \$13,800,000 of Esthonia's bonds, France 10,000,000 francs, and Great Britain £251,000. The internal debt was \$300,000.

History. The Russian Revolution brought with it a state of uncertainty in Esthonia which was not dispelled until late in 1920. Some sentiment inclined toward the Allies; the Baltic lords were openly friendly to Germany. A republican government, proclaimed on Feb. 24, 1918, enjoyed but a brief career before it was put to flight by the German troops who entered the country as a result of the Brest-Litovsk Peace Treaty, captured Reval from the Bolsheviks, and restored the Baltic land barons under German protection. A provisional government, set up by the native moderate elements, was disregarded, and German occupation continued until the end of the year. During May, 1918, the Esthonian National Council was accorded provisional *de facto* recognition by Great Britain, France, and Italy. By the Russo-German treaty of August, 1918, Esthonia's independence was

recognized, but when the Germans withdrew their troops after the Armistice of November, 1918, Soviet forces once more poured in, to be

driven out by local troops with Finnish and British aid. The exiled Estonian leaders returned to their war-ridden country, and on May 19, 1919, the National Assembly declared Estonia a sovereign and independent nation. Hostilities with Russia continued until Dec. 31, 1919. Affairs were complicated by the threat of a German movement on the Baltic states and by the intervention of Allied armies on the northwest coast of Russia in the autumn of 1919. The United States, in an endeavor to gain Estonia's support against the Bolsheviks, offered the country a loan of \$50,000,000, a considerable portion of which was taken. The Russian succession states, Finland, Lithuania, Latvia, and Estonia, wearied of the conflict, and an armistice was signed at Dorpat on Dec. 31, 1919. The Russo-Estonian treaty of Feb. 2, 1920, put an end to hostilities. The terms were remarkably favorable to Estonia. The country's independence was unreservedly recognized and guaranteed by Russia: Estonia received 15,000,000 gold rubles, all Russian public property in Estonia, and exemption from any share in Russian debts. A Constituent Assembly on June 15, 1920, prepared the country's new constitution. A single house, popularly elected on the basis of proportional representation and controlled by the initiative and referendum, was set up. The cabinet, whose premier was designated the State Head, was to be elected by and responsible to the Assembly. The State Court of Justice was to be elected by the Assembly too. The Assembly, in 1921, had 22 representatives of the Labor party, 29 of Socialist parties, and 5 Communists, together constituting the majority bloc; 21 Agrarians, and the rest Populists, Christians, Balts, and Russians. By the Land Act, the church was separated from the state and its extensive holdings confiscated. On June 26, 1921, the Supreme Council of the League of Nations accorded the country *de jure* recognition; shortly afterward, on September 22, it was admitted to the League; recognition by the United States was delayed until July 27, 1922. In May, 1923, the election of the second parliament returned a majority bloc of the bourgeois and peasant parties with the result that M. Paetz, leader of the Peasants' League, was entrusted with the formation of a government.

Russia's consistently friendly policy toward her succession states was further evinced by the series of discussions among the Baltic States, including Estonia, in October and November, 1921, and March and December, 1922. These meetings agreed on arbitration of disputes, confirmation of existing frontiers, agreement on customs, consular, and economic matters; a common economic policy toward Russia, and radical disarmament plans involving the cutting of the Russian Red army to 200,000. In 1923, it appeared for a time that Estonia was prepared to join with Finland and Poland in an alliance aimed at Russia. But peace was maintained, so that all energies, in 1923 and 1924, were devoted to the solution of domestic problems. An indication of stability was the nearly balanced budget of 1924 and the payment of an interest charge of 262,538,500 marks on the United States debt.

ETHICS. From many sources we are persuaded that the story of the ten years 1914-1924 will be incorporated in history as the crisis of the industrial revolution. This means

that it was a time of great moral struggle for those who were alive to the issues. It is not surprising then that ethical theory was in confusion, and further that genuine insights were awaiting intellectual formulation. The present writing can only be an inventory of these insights with as much clarification as "leaps to the eye."

The moral struggle was a continuation and interpretation of the efforts of human minds to bring intellectual clarity to focus on the two ever-present aspects of the ethical problem, the theoretical and the practical. The theoretical problem had arisen from the conflict of science and the cultural tradition, first evidenced in the controversy between religion and science which continued throughout the last century. These ten years showed a decisive reformulation of the problem. Dogmatic religion had split into two parties, one of which had fraternized with science and the other of which had found its place in the subject matters of scientific disciplines such as psychology and anthropology. Free religion, the engendering faith and guardian of human culture still faced the old problem. Partly artist, partly prophet, and partly saint of an intelligent mysticism, it still demanded credentials of the invading scientist. A new religion, if it came, as some claimed it would, must announce doctrines which could stand independent but tolerant of the scientific spirit.

This pointed out the station and duty of ethics: To abstract and judge the issue between these two. Very little that was new could be pointed out as the product of any such activity, but there were beginnings in the shape of demands for a formal ethics at once rigorous and comprehensive enough to command the respect of the parties to the dispute. Perhaps the best evidence of such a demand was the body of writings on the theory of value or *Werttheorie* in America and in Germany. Value was a new term in philosophic literature. It was indicative of two movements not wholly unrelated to the crisis of the industrial revolution. One was a tendency away from the older moralistic tradition which used the term "good." This was seen to carry with it too much outworn and inapplicable connotation. It was practically abandoned. The new term came, significantly enough, from economics. It was generalized and combined with a concept, "worth," which still retained respect because or in spite of its moral significance. The felicity of the combination of "value" and "worth" was largely due to its fitness to symbolize objective rigor and concrete immediacy. Austrian and German writers like Meinong, Rickert and Husserl emphasized its objective aspect; hence their label *Werttheorie*, while American writers such as Urban, Perry, Picard and Prall, stressed the aspect of concreteness and variety so well symbolized in the term "value." There was something of the speculative and critical in the temper of this sort of endeavor, and aesthetics, social science, and ethics might hope for clarification and consequent advantage from this source. However, the formulations were more promising than productive of understanding.

The body of theory arising from the practical problem set by the industrial revolution was voluminous and varied. It was concerned with political, economic, and social programmes. Owing to the work of social and artistic move-

ments such as the pre-Raphaelites, industry had been recognized as something like a cancerous growth in the body politic, and the search for an attitude with which to confront it had led to practical plans on a small scale like the prescriptions of a physician. A peculiar form of social service had been named the case method; social diagnosis and therapeutics were applied. But the malignant growth assumed larger proportions and the plans became the programmes of the social engineer. Physicians' prescriptions gave way to blue prints of society, theories like Graham Wallas' *The Great Society*. Now this sort of attitude and thought is what an older generation called material ethics. In so far as it is ethics, it is the conversion of scientific law into hypothetical commands, or the use of "natural and social conditions" as means to a human end, the good life. Its aim is the prudential control of affairs. As is apparent, it draws on science. Especially it demands and encourages work in the humanistic sciences, anthropology, psychology, social geography, economics, and political science, and these are not lacking, at least nominally. They may be lumped together as sociology or theories of human nature. Their technique was copied from the older physics with entities selected from the flux of human experience and projected on a vast canvas, which had been prepared by Hobbes, Locke, and Rousseau, the panorama of Man in a State of Nature. The economic man and the noble savage of the seventeenth and eighteenth century literature were the points of reference. Impulses, instincts, unit characters, institutions, nations and races were entitized as individuals with purposive drives needing organization, authority and sovereign governments to make them civilized. These elaborations had reached their maximum in these ten years and were the stage scenery of our drama of social life.

Some of these sources of the structural element and the uses to which they were put are interesting. Freud's suppressed ideas, atoms of human nature in the psychic vortex, were renovated and transposed to physiological systems, and we thus had theories of sublimation in aesthetics, in penology, and in the analysis of social revolutions. It was then claimed that a behavioristic ethics was complete, the Ethics of Hercules. Then we had another section of social background coming from anthropology; Levy-Bruhl, Hobhouse, and Westermarck itemized the mores and customs of primitive societies and by analogy found the right and wrong of conduct formulable in terms of conformity or non-conformity with contemporary accepted taboos and restrictions. Marxian doctrines, the economic interpretation of history in particular, had led to both a new evaluation of history and the promulgation of utopian schemes for the reorganization of society. A reaction to this last had combined a great many other fragmentary intuitions of human progress derived from Darwinian and Bergsonian evolutionary theories into a far-reaching ethics of development closely allied to the traditional self-realization ethics of fifty years ago.

All these, as was pointed out above, were blue prints for social engineers. Perhaps the hardest approach to an intellectual vantage point from which to envisage them was made by the pragmatists who were frankly preaching an ethics of expediency. Blue prints for them were

modes of analysis to be referred to in concrete situations as aids in organizing and finding a way through the practical problems of an industrial society. None of them were absolute but relative to the particular end which an individual or community took seriously. If one asked what was the criterion of end, how one could choose between rival purposes, the pragmatists answered with Aristotle that a good man would know, though in other connections a biologico-psychological doctrine of survival and sublimation of complexes was the answer to the query. The pragmatic ethics influenced the theory of law more perhaps than any other field—social expediency would be the apology of the prince for the laws which he sanctioned, and the professor of jurisprudence would criticize existing laws from that basis. One can see how this conclusion would not be satisfactory as a solution of the problem. It was leading to the restating of the question which only a formal ethics could answer. A definite word on the theory of value was awaited to crystallize opinion regarding the good of society. But then, others were skeptical and put the question whether ethics was a science of value or the art of living. An observation from this point of view is significant. Social engineers, when they are men, seek a prophet. Souls as well as society need salvation. See also SOCIAL PSYCHOLOGY.

ETHNOGRAPHY. The War naturally had a profound effect on the prosecution of European field studies and publications, and this accounts for the disproportionately greater amount of American work during the period 1914-24 which demands notice. The most useful general work, however, is of German origin, Buschan's *Illustrierte Völkerkunde* in its revised and greatly augmented third edition (1922), the work of a whole group of collaborators under Buschan's editorship.

North America. The advance made by Americanist studies can be roughly gauged by comparing Clark Wissler's *The American Indian* (2d ed., 1922) and L. Farrand's earlier *Basis of American History*. Precisely because of the general sanity of Farrand's outlook and the essential agreement of these authors as to the independent development of the American Indian and his racial homogeneity, the great gaps in knowledge that Wissler's predecessor had to contend with stand out in sharp relief. In spite

of much good pioneer work elsewhere, the Eskimo and the Northwest Coast Indians were practically the only subdivisions thoroughly known in North America at the beginning of the twentieth century. Since then intensive field work has made California, the Plains region, and the Southwest equally well known and added materially to information on the remainder of the continent.

A novel departure consists in the ever-increasing linguistic syntheses of the last decade, which are of more than philological interest since they suggest hitherto unsuspected affiliations or migrations. R. B. Dixon and A. L. Kroeber may be said to have led the way by reducing the number of Californian stocks, which hitherto had been set at over twenty. Their basic communication (*American Anthropologist*, vol. xvi, pp. 647-655) united Wintun, Maidu, Yokuts, Miwok and Costanoan in a larger Penutian family, while Shasta, Karok, Pomo and Yuma were put into another major Hokan family. A subsequent monograph by the same authors on *Linguistic Families of California* (1919) recognized but a solitary isolated tongue, Yuki, all others falling into the Penutian, Hokan, Shoshonean, or Algonkian stock.

This radical result was obtained by accepting E. Sapir's proof of the Algonkian relationship of Wiyot and Yurok, and of the Hokan affiliations of Yana (*American Anthropologist*, vol. xv, pp. 617-646; *University of California Publications in American Archaeology and Ethnology*, vol. xiii, No. 1). Sapir, by virtue of his philological training, stood as the leader of the synthetizers. He revived Brinton's theory of a Uto-Aztecan stock uniting the Shoshonean and Nahua languages (*Journal de la Société des Américains de Paris*, 1914, pp. 379-425) and combined the Athabaskan, Tlingit, and Haida into one Nadene family. In short, he broke definitely with the traditional classification current since Powell and aimed at a grouping as comprehensive as possible. On the other hand, he did not go to the extremes of P. Radin, who in *The Genetic Relationship of the North American Indian Languages* (*University of California Publications*, vol. xiv, pp. 489-502) affirms that all of these form one grand stock.

It should be noted that protests against Sapir's Algonkian conclusions were made by T. Michelson, while Boas voiced doubts as to the legitimacy of synthetizing languages in the manner characteristic of the new school. Without denying the occurrence of historical connection between such groups as Tlingit and Athabaskan, Boas insists that we are dealing not with divergence from a common ancestral tongue but with a development comparable to acculturation. He admits that in the absence of historical knowledge it might be very hard to establish the connection between Armenian and English, but holds that where such information is lacking no sound inferences as to genetic unity can be drawn (*American Anthropologist*, vol. xxii, 1920, pp. 367 et seq.).

The *International Journal of American Linguistics*, founded by F. Boas, P. E. Goddard, W. Thalbitzer, and C. Uhlenbeck, continued publication of both concrete and theoretical studies.

Southwestern United States. Archaeologically, the outstanding achievement lay in the rigorous application of stratigraphic methods, which were used most extensively in the Southwest. The

leaders in this field were N. C. Nelson (*Pueblo Ruins of the Galisteo Basin*, 1915) and A. V. Kidder (*Pottery of the Pajarito Plateau*, 1915, and "Notes on the Pottery of Pecos," in *American Anthropologist*, 1917, pp. 325-360), who have independently established a relative chronology mutually corroborative in its main outlines. Thus, the black and white earthenware is now recognized as the oldest pottery of the area, and the introduction and decay of a glazed decoration have been fixed in the series of stages and the art traced to the Little Colorado as its centre. A. V. Kidder's and S. J. Guernsey's joint paper on *Archaeological Explorations in Northeastern Arizona* (1919) was especially noteworthy as determining a basket-making culture akin to that of Grand Gulch, Utah, antecedent to the Pueblo culture, and representing the first steps in that direction. While the sites investigated displayed coiled basketry, pottery was rare or lacking, cultivation was limited to a single variety of maize and failed to include beans, the turkey was not yet domesticated, cloth was absent, and there were no substantial habitations. The spear-thrower occurred, but no bow had been discovered. Abalone shells point to a trade connection with California. Other interesting studies on this region are *The Aztec Ruin* (1919) by E. H. Morris, who suggests the cañons north of the San Juan River as the locality of the nascent Pueblo culture; and W. Hough's *Exploration of a Pit House Village* (*Proceedings of the United States Museum of Natural History*, vol. lv, 1919).

Besides these systematic researches in the Southwest there was much local excavation that may ultimately lead to broader conclusions. L. Spier's *The Trenton Argillite Culture* (1910) may be singled out for the careful examination of a much disputed site; Spier did not deal either with the uppermost layer connecting with the historical tribes of the region nor with the lowest, relatively ancient stratum; but he described the intermediate deposits, which are lacking in pottery and altogether reveal no affinities with any known culture. In his *Handbook of Aboriginal American Antiquities* (1919) William H. Holmes, the dean of American archaeologists, summarizes the results of his life-long studies, presenting the accepted view of American scholarship as to such basic problems as the supposedly palaeolithic remains found in the New World.

Northern Peoples. Turning to studies of peoples still extant, D. Jenness, a member of Stefansson's expedition, has published a scientific study of *The Life of the Copper Eskimo*, a hitherto little-known group, while Thalbitzer's *The Ammassalik Eskimo* (1914) deals with a subdivision of the Greenlanders. Thalbitzer derived the Greenlanders from the northern and western parts of Hudson's Bay but sought the American home of all the Eskimo rather in Alaska than in the central region of their habitat. The tribes of coastal British Columbia, while looming less prominently in the literature than in the decade preceding, were represented by several notable works, such as F. Boas's *Tsimshian Mythology and Ethnology of the Kwakiutl* (31st and 35th Annual Report of the Bureau of Ethnology). The former contains a suggestive inquiry into the extent to which native custom is reflected in tradition. For a rapid survey of the Northwest Coast culture, with special emphasis on the southern tribes,

two short papers of E. Sapir may be specially recommended *The Social Organization of the West Coast Tribes* (*Transactions of the Royal Society of Canada*, 1915, pp. 355-374) and *Vancouver Island Indians* (*Hastings's Encyclopædia of Religion and Ethics*).

Passing to the Eastern Woodland area, F. G. Speck's papers on *Family Hunting Territories* (1915) and *The Family Hunting Band as the Basis of Algonkian Social Organization* (*American Anthropologist*, 1915, p. 289 et seq.) definitely established the prevalence of individual land ownership among hunting tribes, a conclusion he later corroborated by other studies in the same general area. A. B. Skinner published a full volume of *Folklore of the Menomini Indians* and a paper on the *Associations and Ceremonies of the Menomini Indians* (1915), to which might be added another on *Medicine Ceremony of the Menomini, Iowa and Wahpeton Dakota* (1920), since the two last-named tribes have culturally as much affinity with the Central Algonkians as with the Prairie aborigines. P. Radin's *The Winnebago Indians* (*39th Annual Report of the Bureau of Ethnology*, 1923) is one of the most complete monographs of any tribe extant, especially along the lines of religious usage; and *The Autobiography of a Winnebago Indian* (1920), edited by him, is an interesting human document presenting native culture from the native point of view.

Plains Indians. Thanks to the intensive researches prosecuted during 1914-24, the Plains area became one of the best known in the world. It is now fairly clear that the southern tribes have very intimate relations with the Central Algonkian Woodlanders, while the northern tribes represent more definitely the popular concept of the Plains Indian. To our knowledge of material culture within the area Wissler has made by far the most striking contributions, which are in part embodied in his two general books on *The American Indian and Man and Culture*; of his special papers may be cited *Riding Gear of the North American Indians and Costumes of the Plains Indians* (both in the *Anthropological Papers of the American Museum of Natural History*, 1915). Under the auspices of the American Museum of Natural History two protracted series of investigations were undertaken on the ceremonial activities comprehended under the heads of Sun Dance and Age Societies; the results are summarized in R. H. Lowie's *Plains Indian Age Societies: Historical and Comparative Summary* (1916) and L. Spier's *The Sun Dance of the Plains Indians: its Development and Diffusion* (1921). Both discussions demonstrate the complexity of primitive ritual and illustrate the processes of ceremonial accretion.

Several Plains tribes hitherto inadequately described were thoroughly studied, at least in part of their cultural manifestations. Thus G. B. Grinnell published a two-volume work on *The Cheyenne Indians* (1923). G. L. Wilson's *Agriculture of the Hidatsa Indians* (1917) offered one of the most detailed economic studies of a primitive people, while R. H. Lowie's studies on the social life, societies, religion, art, and material culture of the Crow Indians (*Anthropological Papers, American Museum of Natural History*, 1912-23) constitute an approximately complete survey of Crow culture. Considerable light was shed on the Pawnee, Mandan, Hidatsa and Kiowa by the ceremonial studies

mentioned above, and additional information was contributed on such relatively familiar tribes as the Blackfoot and Dakota. Much valuable information was added to our knowledge of the last-mentioned people in F. Densmore's *Teton Sioux Music* (1918). F. LaFlesche's *The Osage Tribe* (1922) constitutes the first installment of a scientific account of a virtually unknown people. A remarkable comparative study by R. F. Benedict on *The Vision in Plains Culture* (*American Anthropologist*, 1922, pp. 1-23) traced the variations of the visionary experience as a cultural phenomenon within this area and proved among other things that the vision-quest is by no means predominantly a feature associated with puberty.

Another region that became incomparably better known is the Southwest. This was due largely to the enthusiasm of Elsie Clews Parsons, who was rapidly working toward a synthesis of the sociological and religious culture of all the Pueblo peoples. Some of her numerous papers, published in the *American Anthropologist*, the *Memoirs of the American Anthropological Association*, and the *Anthropological Papers of the American Museum of Natural History*, are *Notes on Zuñi*, *Notes on Acoma and Zuñi* (1918), and *Laguna Genealogies* (1923). She also edited (1920) the earlier *Notes on Cochiti* by Father N. Dumarest, perhaps the clearest and most concise trustworthy account of any Pueblo tribe, exhibiting the characteristic matrilineal descent, the tribal men's society of rain-producers impersonating gods, the curing fraternities admitting women to membership.

A. L. Kroeber's *Zuñi Kin and Clan* (1918) is remarkable for the detailed, genealogically documented investigation of relationship terms and the heterodox views advanced on the clan organization, which is said to be of subordinate importance, while the matriarchate is reduced to female house ownership. A posthumous paper by H. Haeblerlin (*Baessler-Archiv*, vol. vi, 1921, pp. 1-35) showed that Pueblo pottery designs are simply plaitwork patterns transferred to earthenware without a realization of the greater freedom possible with the new material. The nomadic Southwesterners have not been wholly neglected, as is shown by P. E. Goddard's *Myths and Tales from the San Carlos Apache*, 1918.

California. A third region that has been intensively investigated is California, the results being virtually all recorded in the *University of California Publications in American Archaeology and Ethnology*. A. L. Kroeber, assisted by E. W. Gifford, T. T. Waterman and others, has been the organizer of this survey, and his more general conclusions may be gleaned from his essays on *Californian Culture Provinces* (1920) and *Elements of Culture in Native California* (1922). A series of papers partly of comparative character are united in the *Mrs. Hearst Memorial Volume* (1923) issued by the same institution. Gifford's work was mainly along the lines of social organization, his paper on *Clans and Moieties in Southern California* (1918) definitely demonstrating the occurrence of these units, while various of his studies on kinship terms were among the most detailed available. T. T. Waterman's *Yurok Geography* (1920), though primarily devoted to place names, contained much other information, especially on property rights.

Among the general comparative investigations covering the continent none probably rivaled R. F. Benedict's *The Concept of the Guardian Spirit in North America* (1923). Extending the Plains researches already noted, the author showed that throughout North America the vision was the dominant religious fact. In addition she indicated the varying combinations into which this phenomenon entered and characterized the several geographical provinces. Finally must be mentioned *American Indian Life* (1922), the joint labor of twenty scholars rallied under the editorship of Mrs. Parsons. This is a unique attempt to delineate in short-story form but with complete fidelity to truth the life of a large number of distinct tribes. See also INDIANS, *United States*.

Central and South America. In Mexico, between 1914 and 1924, there was considerable activity, thanks to the energy of Dr. M. Gamio and his associates, who had concentrated on both archaeological excavation and a high linguistic reconnaissance. The Maya cultures were studied most intensively by H. J. Spinden and S. G. Morley, who arrived at concordant conclusions as to the chronology of the area, which seems to have displayed a considerable advancement about the beginning of our era. Spinden summarized the information concerning this region in a concise handbook on *Ancient Civilizations of Mexico and Central America* (1917), and Morley provided *An Introduction to the Study of the Maya Hieroglyphs* (1915), in which the principles of Maya arithmetical notation were set forth in an elementary way. The same author's book on *The Inscriptions at Copan* (1920) was of a more technical character.

Among the most significant contributions to culture-history were P. Rivet's studies of New World metallurgy, especially the two papers published with the collaboration of H. Arsan-deaux, *Contribution à l'Étude de la Métallurgie Méxicaine* (*Journal de la Société des Américanistes de Paris*, vol. xiii, pp. 261-280 et seq., 1922) and their *Nouvelle Note sur la Métallurgie Méxicaine* (*L'Anthropologie*, 1923, pp. 63-83). Aboriginal Mexico had formerly been credited with the knowledge of smelting copper but not with that of deliberately alloying it with tin to make bronze. The production of bronze in Peru was established in 1915 by C. W. Mead's *Prehistoric Bronze in South America*, which demonstrated both by documentary Spanish records and by a review of archaeological finds that bronze was made intentionally within the ancient Inca empire. However, it was supposed that this development was restricted to Peru and its immediate neighbors. Rivet's work proved by chemical analysis that bronze was also, though to a lesser extent, intentionally produced by the ancient Mexicans, while its complete absence in Colombia indicated that there an independent centre of metallurgy evolved and that Mexico was influenced by Peru via maritime connection. The reactions of a modern textile expert to the products of ancient Peruvian loom-work were recorded in detail in M. D. C. Crawford's *Peruvian Textiles* (1915) and *Peruvian Fabrics* (1916).

A summary of the mythologies of this entire region was provided by H. B. Alexander in *The Mythology of all Races: Latin-American* (1920). Theodor Koch-Grünberg in his *Indianermärchen aus Südamerika* attempted to trace connections between the tales of the two major subdivisions

of the western hemisphere (*Journal of American Folk-Lore*, 1922, p. 329 et seq.). Most valuable *Comparative Ethnological Studies* in several volumes have been published since 1918 by Baron Erland Nordenskiöld of the Göteborg Museum, on data supplied partly by his own observations in Bolivia and the Gran Chaco, and partly by the utilization of the extant literature.

Asia. A notable event was the founding of a new quarterly, *Man in India* (1921), edited by Sarat Chandra Roy, with the collaboration of many scholars within and outside of India. A noteworthy ethnographic work was A. R. Brown's *The Andaman Islanders* (1922). These natives appear far more diversified than had been realized. Those of Great Andaman and of Little Andaman speak quite unintelligible, though structurally related, tongues, and there are subdivisions characterized by appreciable distinctions in both speech and custom. Brown definitely corroborated Man's statements as to the lack of the clan, totemism, and a classificatory kinship system. Comparison with other Negrito peoples indicated that the primeval Negritos were hunters conversant with the use of the bow but more familiar with work in bone, wood, and shell than with stone techniques. Pottery and the outrigger canoe are probably later acquisitions of the Andamanese but antedated the segregation of their two major subdivisions. Since their settlement in the Andamans there is practically no evidence of alien influence.

Assamese officials continued the valuable series of books on their native wards, those by J. R. Hutton on *The Sema Nagas* (1922) and by J. P. Mills on *The Lhota Nagas* (1923), meriting special consideration. Much new work was done in the Philippines. An exceedingly thoroughgoing *Study of Bagobo Ceremonial, Magic and Myth* (1917) by L. W. Benedict not only gave a detailed descriptive account but also established interesting historical connections between the culture of the Indo-Iranians and Mindanao, while the influences of China and of Islam were appraised as relatively slight. R. F. Barton's *Ifugao Law* (1919) gave a vivid and circumstantial account of the definite juridical code in vogue among an all but anarchistic tribe in Luzon. The mythology of a Philippine people was discussed from a comparative angle in Fay Cooper Cole's *Traditions of the Tinguian*. In earnest of a fuller description Mrs. J. B. M. McGovern offered a popular report of life *Among the Head-hunters of Formosa* (1922), where women cultivate the soil and enjoy unusual prestige, acting as both priests and chiefs.

Except in so far as Russian sources hitherto inaccessible may be concerned, the Siberian literature remained somewhat weak in monographic contributions as compared with the classical works of W. Bogoras and W. Jochelson early in the century. Bogoras's *Tales of Yukaghir, Lamut and Russianized Natives* (1918) appeared in English, and several good articles on the aborigines were included in Hastings's *Encyclopædia of Religion and Ethics*. A most useful handbook of the social and religious customs was issued by M. A. Czaplicka under the caption *Aboriginal Siberia*. The same author also produced a work on *The Turks of Central Asia*, in which the South Siberians of the Bronze and early Iron Age were identified with Turks, a conclusion adopted by B. Laufer. The home of the Turks seems to have lain in southern

Mongolia, while the country now called Turkistan was peopled by Iranians.

For a number of classical studies in Asiatic culture-history we are indebted to B. Laufer. His work on *The Beginnings of Porcelain in China* (1917) is one of the most illuminating contributions to our knowledge of cultural dynamics. In it the Chinese are shown as ancient potters but originally ignorant of glass; as borrowing the glazing technique from the West, but then developing it independently in conjunction with pottery, and finally as a result of centuries of experimentation producing porcelain. Laufer's *Sino-Iranica* (1919) traces the cultural connections between China and western Asia and establishes the definite borrowings made by and from the supposedly isolated Chinese. In a brief paper on *The Language of the Yüehi or Indo-Scythians*, Laufer argued that these must be classed as of Indo-Germanic stock.

Africa. C. Meinhof's and D. Westermann's linguistic investigations were followed by others, of which Sir Harry Johnston's *Comparative Study of the Bantu and Semi-Bantu Languages* gave a survey of not less than 274 distinct languages. A. Drexel advanced some radical hypotheses, notably the genetic affinity of Bornu with Sumerian (*Anthropos*, vol. xiv-xv, pp. 215-274; vol. xvi-xvii, pp. 73-108); but these awaited confirmation. A useful distribution map was given by H. Haberlandt in the second edition of Buschan's *Illustrierte Völkerkunde* (1922). A considerable amount of excellent material was brought together in the five volumes of the *Harvard African Studies* founded by Oric Bates and edited by E. A. Hooton. Among the longer papers published may be mentioned H. S. Stannus's description of the Wayao, E. Cerulli's collection of Galla folk-literature, including poetry as well as prose, and C. G. Seligmann's account of the camel-nomad Arabs known as the Kababish.

B. Ankermann's "Verbreitung und Formen des Totemismus in Afrika" (*Zeitschrift für Ethnologie*, 1915, pp. 114-180) was a model study and established some significant conclusions, such as the independence of totemism and exogamy in the area examined, the patrilineal descent of the totem irrespective of other coexisting rules of descent, and the probable lack of genuine totemism in ancient Egypt. L. Frobenius once more appeared with a startling theory in *Das Unbekannte Afrika*. He differentiated an Ethiopic and a Hamitic culture, the former characterized by age-grades, belief in reincarnation, patrilineal descent and agriculture; the latter, by maternal descent and pastoral conditions. F. von Luschan's monumental work on *Die Altertümer von Benin* (1920) pleaded for the virtually independent character of Benin art in some respects, yet suggested an ancient connection between southern Europe and the western Sudan. N. W. Thomas's *Anthropological Report on the Ibo-speaking Peoples* and subject reports on neighboring tribes supplemented our knowledge of the western Sudanese, while *The Lango* by J. H. Driberg provided a study of a Nilotic tribe in Uganda exhibiting the joint influence of Bantu and Sudanese features.

The Bantu also became better known. E. W. Smith and A. M. Dale published a standard work on *The Ila-speaking People of Northern Rhodesia* (1920), who differ in their matrilineal and exogamous customs from their paternally

and rather loosely organized congeners to the southeast. J. Roscoe added to his earlier work on *The Baganda* one on *The Northern Bantu* (1915) and other books. In *The Northern Bantu* he presented a singularly clear picture of the development of definite castes through the conquest of a horticultural people by a numerically weaker but better organized pastoral group. The rise of such an aristocracy was also well brought out in J. Czekanowski's *Forschungen im Nil-Kongo Zwischengebiet*; in this region a third caste is constituted by the under-sized hunting tribe called Batwa, who strangely combine the status of pariahs, potters and rain wizards.

Oceania and Australia. Linguistically the earlier synthesis of W. Schmidt, who connected Malayo-Polynesian with certain languages of India and farther India was extended by A. Conrady (*Anthropos*, vol. xii-xiii, p. 702 et seq.), who arrived at the conclusion that Schmidt's "Austrie" stock is genetically related to all farther Indian languages, as well as to Tibetan and Chinese. This finding could not of course be accepted without further inquiry. Australian languages were investigated and classified by W. Schmidt.

Ethnographically a number of significant works were published. B. Spencer in his *Native Tribes of the Northern Territory of Australia* described a very atypical group of natives, especially the Kakadu, and the Melville and Bathurst Islanders. Thus, the rites of subincision and circumcision are lacking, and women are permitted to witness the boys' initiation. Tree-burial is unknown, interment being always practiced. The realistic drawings on bark and on rocks are likewise utterly un-Australian and suggest some foreign influence. West Australia also no longer continued a *terra incognita*, thanks to Prof. A. R. Brown, whose "Notes on the Social Organization of Australian Tribes" (*Journal of the Anthropological Institute*, vol. xlviii, p. 222 et seq.) supplemented his earlier studies among the Kariara and their neighbors.

New Guinea and Melanesia likewise fared well. R. Thurnwald's memoir on *Banaro Society* (1917) gave a detailed account of the intricate social and kinship system of a Papuan people; P. Wirz in *Die Marind-anim von Holländisch-Süd-Neu-Guinea* (1922) described the tribe otherwise known as Tugeri; and the elaborate economic conceptions, marked by ritualistic ramifications, of another New Guinea group were set forth in B. Malinowski's *The Argonauts of the West Pacific* (1922). A preliminary account of Melanesians was published by F. Sarasin under the caption of *New-Caledonien und die Loyalty Inseln* (1918). Mr. and Mrs. W. S. Routledge's *The Mystery of Easter Island* (1920), with its authentic account of the famous statues and the elaborate bird-cult of this easternmost Polynesian group, evoked considerable interest, and Rivers interpreted the huge figures described as resting-places for the souls of the dead. "The Hawaiian Romance of Laieikawai" (*Report of the Bureau of American Ethnology*, 1920) was a re-publication of the original text with a translation and numerous explanatory notes by M. W. Beckwith, who thus provided one of the most interesting documents for the study of primitive literature. P. A. Erdland's paper on *Die Marshall-Insulaner* is a valuable monograph on a Micronesian tribe, with exog-

amy, matrilineal descent, cross-cousin marriage, and a kinship system strongly suggestive of the Hawaiian type. Many useful papers also appeared in the technical journals and the publications of the Bishop Museum in Honolulu. The historical interpretation of Oceanian data was powerfully influenced by the two schemes alluded to; that of F. Grübner's *Methode der Ethnologie*, with the emendations supplied by W. Schmidt, and the system of W. H. R. Rivers's *The History of Melanesian Society* (1914). See ANTHROPOLOGY; ETHNOLOGY.

ETHNOLOGY. Following the publication of F. Grübner's *Methode der Ethnologie* (1911), theoretical discussion was largely concerned with the interpretation of similarities in culture, and the most notable phenomenon to be recorded was the reaction against the formerly regnant theories of psychic unity, parallelism and unilinear evolution. The catchword opposed to these shibboleths of an earlier day was diffusion, and it was less as to the occurrence of borrowing than as to its extent and the paths of cultural dissemination that scholars remained at loggerheads. For convenience' sake three main anti-evolutionist schools, opposed to unilinear evolution, may be distinguished: the British, the German, and the American.

The British and German schools were at one in emphatically repudiating the likelihood of independent invention for the same cultural feature, but their schemes otherwise differed fundamentally. Characteristic of the British school were certain principles evolved by Dr. W. H. R. Rivers and applied by Prof. G. Elliot Smith and W. E. Perry to the proposition that much, nay, most of the culture hitherto ascribed to primitive peoples is neither primitive nor primeval but represents the débris of archaic Egyptian civilization, as diffused after the Sixth Dynasty. The possibility of such dissemination was considered established by Rivers's paper, *The Contact of Peoples*, in which the suggestion was thrown out that a very small number of immigrants could impress their culture upon a large native population, provided only their superiority in the arts of life were manifest. Further, the criterion formerly required as evidence of diffusion, to wit, continuous distribution, was rejected as a result of Rivers's proof that in several instances even useful arts have fallen into desuetude.

It was argued, then, that from Egypt as a centre such crafts as stonework and pottery, such beliefs as the sun-cult and animism, and a series of other traits grouped together as "the archaic civilization," were diffused to the four corners of the globe; and that the geographical *lacunæ* in the distribution were the result of degeneration. The consistent application of these ideas led not only to such conclusions as that American Indian civilization in its higher forms was wholly an alien product engrafted upon an extremely slender stock of indigenous customs and modes of life; but even to the assertion that the totemism and magic of the Australians represented deteriorated elements of the old Egyptian complex. Rivers contented himself with laying the theoretical base for this structure and applying the principles to Oceanian developments in *The History of Melanesian Society* (1914). The emphasis upon Egypt was due to G. Elliot Smith, whose *Primitive Man* (1916), *The Evolution of the Dragon* (1919), and other essays, discussed both the psycho-

logical and the historical aspects of the problem. A complete exposition of the scheme, with special attention to America, was offered by W. E. Perry in *The Children of the Sun* (1923).

The German point of view, originally set forth in two lectures by F. Grübner and B. Anker-mann (*Zeitschrift für Ethnologie*, 1905), and later codified in Grübner's *Methode*, did not ascribe to Egypt nor to any other single area an absolute hegemony in cultural development. In both its original and its amended forms this theory postulated a primeval culture best represented in recent times by the Tasmanians and Pygmies. From this common starting-point evolved two (Grübner) or three (W. Schmidt) divergent primary cultures, each displaying a characteristic combination of traits. Thus, in Father Schmidt's amended scheme as expounded by himself and his disciple, Father Koppers, in various articles of their journal *Anthropos*, and by Koppers in a book on *Die Anfänge des Menschlichen Gemeinschaftslebens* (1921), were three distinct cultural spheres (*Kulturkreise*): a horticultural one with matrilineal descent and exogamy; an industrial hunting culture with patrilineal descent, totemism, and exogamy; and a pastoral non-exogamous culture with paternal descent. All other cultures were the result of blendings of these primary cultures, and the final product of such amalgamation was the germ of higher Mediterranean civilizations. The traces of these primary cultures were diligently sought in all continents, including America, and the New World culture was traced, not indeed to Egypt, as by the British diffusionists, but to southeastern Asia.

In striking contrast to the world-spanning schemes of both the British and the Germans stood the American diffusionists. Their position was outlined in F. Boas's "The Methods of Ethnology" (*American Anthropologist*, 1920, pp. 311-320), where the work of Kroeber, Parsons and Spier in the Southwest and of Lowie on the Plains Indian age-societies was cited as representative. Contrary to the allegation of the European diffusionists, this school did not set up a Monroe Doctrine barring the occurrence of extraneous influences on the New World aborigines. On the contrary, these influences were explicitly admitted, with references to such elements as the composite bow and various mythological tales; what was denied was the necessity for evoking foreign contact to account for the development of the more complex civilizations of Peru and Mexico. Altogether, less emphasis was placed on the tracing of historical connections between remote areas, though as shown in Kroeber's *Anthropology* their demonstration was by no means eschewed on principle. The essential thing, however, was on the one hand to reconstruct the actual culture-history of a limited area by an intensive study, with a minimum of pure speculation; and, above all, the mere establishment of historical relations was considered not the be-all and end-all of research but rather a starting-point for the investigation of the psychology of diffusion, the reasons for the selection of some elements while others were spurned; in short, the dynamics of cultural change. To this important subject several interesting contributions were made. Noteworthy among them was P. Radin's essay on the spread and growth of the Peyote cult in his monograph on *The Winnebago Indians* (37th

Annual Report of the Bureau of American Ethnology).

While the stressing of this aspect of the problem was undoubtedly a striking characteristic of the American school, it would be unfair to deny that similar tendencies were discernible elsewhere. Dr. R. R. Marett, independently of any school, suggested, if he did not himself cultivate, similar lines of research in his *Psychology and Folk-Lore* (1921). Rivers, a psychologist and physiologist by early training, devoted some papers to this subject, though almost uniformly with a definite bias, i.e. in the interests of his special scheme rather than of cultural dynamics generally. F. C. Bartlett, a British psychologist, offered a book on *Psychology and Primitive Culture* (1923), in which he not only concentrated attention on the processes incident to cultural borrowing but presented for the first time the spectacle of a European writer taking adequate cognizance of American theories and facts. The logic of historical reconstruction was suggestively discussed in E. Sapir's *Time Perspective in Aboriginal American Culture* (1916) which was also noteworthy for the utilization of linguistic evidence.

One of the fields jointly cultivated by psychology and anthropology was that of racial differences. With the emphasis on the study of individual mental variability it was inevitable that the tests applied in psychological laboratories should be extended to other than Caucasian stocks for the purpose of ascertaining possible group differences. The earlier work of Rivers on Torres Straits Islanders and of Woodworth on the several distinct stocks exhibited at the St. Louis Fair failed to reveal far-reaching differences but within the decade 1914-24 the subject was vigorously attacked anew. In the United States especially the presence of a large Negro group and the influx of a new type of immigrants stimulated a scrutiny of the constituents entering into the general population, and the tests on army recruits of different extraction as reported in the *Memoirs of the National Academy of Sciences*, vol. xv (1921), were widely quoted and popularized. Characteristic of some of the work attempted was T. R. Garth's "Comparison of the Intelligence of Mexican and Mixed and Full Blood Indian Children" (*Psychological Review*, 1923, p. 388 et seq.). The author found positive differences, the mixed-bloods ranking highest, the Mexicans next, and various Indian groups following in definite tribal sequence; but he admitted his inability to control the environmental factor. Some writers, however, who did not make such reservations, sank to the level of propagandists of the lowest type, rationalizing or even glorifying their traditional prejudices. Such charlatanism is unfortunately bound to throw discredit on a perfectly legitimate branch of inquiry.

Of the sincere investigators some were predisposed to assume mental differences because the observed biological differences seemed to them necessarily correlated with those of mentality; in a very moderate form this is likewise the position of F. Boas with reference to Negroes and Caucasians. Cultural anthropologists generally did not maintain the existence of racial differences in the extreme form popular with their biologically oriented colleagues. Two positions were held. Some were impressed with the very great differences observable in grade of culture and explained them by inborn mental dif-

ferences between the bearers of these cultures; others denied that cultural differences constituted a cogent argument, since the history of the Caucasians or Nordics exhibits enormous cultural differences within a period so brief that innate variation is excluded so that environmental factors must be taken into account. The former point of view was that of C. Wissler's *Man and Culture* and R. B. Dixon's *The Racial History of Man*, the latter was advocated in A. L. Kroeber's *Anthropology* and R. H. Lowie's article on "Psychology, Anthropology and Race" (*American Anthropologist*, 1923, pp. 291-303). Kroeber and Lowie, it should be noted, did not deny racial differences but rejected the evidence formerly advanced as lacking in cogency. Lowie proposed a programme by which relatively pure anthropological groups could be isolated and studied comparatively.

In the earlier years of the decade 1914-24 anthropologists were particularly eager to assert their complete independence of psychology and to explain culture exclusively in cultural terms, while latterly more cordial relations were assumed toward the sister science by the very men who formerly spurned her services. Thus, Kroeber, who in his article on *The Super-organic* (*American Anthropologist*, 1917, pp. 163-213) tended to divorce historical from psychological inquiry, came to look toward psychology for an ultimate explanation; and a similar shifting might be demonstrated in the case of Wissler, Rivers, and Lowie. A first tentative essay toward a synthesis of psychological principles as displayed in the ethnographic field was presented by R. Thurnwald in his *Psychologie des Primitiven Menschen* (1922). In part the rapprochement was due to the influence of Freudian theories, though ethnologists generally repudiated the incursions of psychoanalysts into their own domain. Freud himself attempted to apply the principles of psychoanalysis to an interpretation of *Totem and Taboo* (1918), while his followers traced connections between primitive myth and the ideation of their mentally deranged patients. W. H. R. Rivers, himself a psychoanalytic practitioner, offered several suggestions for the elucidation of ethnological problems, as in his presidential address on *Conservatism and Plasticity* (*Folk-Lore*, 1921, pp. 10-27). Here the attitude of the individual Melanesian towards the council of elders was brought under the concept of the father-complex, which was thus made to account for the primitive tendency to conservatism, while the possibility of a change was ascribed to a transfer of regard to the representatives of an alien culture. W. Wundt's monumental *Völkerpsychologie*, while psychological in orientation, contained much of interest to anthropologists.

Anthropological research into philology was outlined in its broader psychological as well as historical aspects in E. Sapir's *Language* (1922), one of the outstanding synthetic works of the period. It presented a wholly novel scheme of classification. Primitive music was systematically studied in Germany and America. In the former country E. von Hornbostel examined the records brought by explorers from different parts of the world and was at work on a scientific method of transcription. In America, Frances Densmore published a series of tribal studies on the Ojibwa, Sioux, Shoshoneans, Mandan and Hidatsa in the *Bulletins of the Bureau of American Ethnology*, while Helen H.

Roberts advanced the subject by reviews and articles in the *Journal of American Folk-Lore* and the *American Anthropologist*. The application of exact measurements to the study of primitive art along the lines of G. T. Fechner was advocated in Lowie's *A Note on Aesthetics* (*American Anthropologist*, 1921, p. 170 et seq.); and following suggestions of F. Boas, G. A. Reichard published an essay on *The Complexity of Rhythm in Decorative Art* (*American Anthropologist*, 1922, p. 183 et seq.). P. Radin's *Literary Aspects of North American Mythology* (1915) directed attention to the purely stylistic element often neglected in the study of primitive prose literature.

The traditional views on social organization popularized by L. H. Morgan, especially regarding the question of descent, were expounded in E. S. Hartland's *Matrilineal Kinship and the Question of its Priority* (1917) and his *Primitive Society* (1921). A brief outline of the development of social life as conceived by Father Schmidt was presented in the book by Koppers cited above. A significant point of difference from the older theory lay in the idea that maternal and paternal descent belong to different lines of evolution, so that the question of their respective priority is made futile. R. H. Lowie's *Primitive Society* (1920) likewise denied the necessary priority of either maternal or paternal descent: either method was represented as growing naturally from a loose organization through the stressing of either the father's or the mother's kin as a consequence of modes of residence or of transmitting property. Another integral part of the classical doctrine attacked by Lowie related to the absence of individual property, which in one form or another was shown to exist even on the plane of the simplest peoples. Again, this author maintained against Maine and Morgan that germs of political organization appear even in very rude tribes, the blood-bond between kinsmen being supplemented by a territorial bond partly established by the clubs, fraternities, and other associations so frequently found among illiterate peoples.

Rivers's booklet on *Kinship and Social Organization* (1914), vindicated the correlation between social usage, especially marriage customs, and relationship terms. More particularly, he contended for a connection between exogamy and the classificatory system of relationship. This publication proved highly stimulating to American scholars. Lowie established the general validity of this correlation for the region north of Mexico and summarized the results in *Primitive Society*; Kroeber, E. C. Parsons, and Lowie systematically collected Southwestern kinship systems, some of which were published in Kroeber's *Zuni Kin and Clan* and several minor communications to the *American Anthropologist* by E. C. Parsons; and E. W. Gifford amassed a wealth of relevant information in California (*Californian Kinship Systems*, University of California Publications, 1922).

Totemism continued to arouse interest, and for several years Father Schmidt issued an international symposium on the subject in his journal *Anthropos*. A model study of the data within a circumscribed area was furnished by B. Ankermann in his *Verbreitung und Formen des Totemismus in Afrika* (*Zeitschrift für Ethnologie*, 1915). This work proved that in Africa the totem, irrespective of other rules of descent, is transmitted from father to child. Anker-

mann is not convinced that genuine totemism occurred in ancient Egypt. This is a conclusion of some importance, since G. Elliot Smith and Perry traced even Australian totemism to an Egyptian source. A. A. Goldenweiser did not consistently adhere to the negative attitude of his *Totemism: an Analytical Study* (1910), but later argued in several essays and in his book on *Early Civilization* (1922) for an organic union of totems and exogamy.

In the field of religion attention should be called to Hastings's completed *Encyclopædia of Religion and Ethics*. Though including much other material as well, it was of great importance in the present connection, since many articles were written by anthropologists and in some instances presented not only brief summaries by experts but even information otherwise quite inaccessible. W. D. Wallis's *Messtahs: Christian and Pagan* (1919) contained much valuable description and duly emphasized the problem of the individual's relation to society in the religious domain. The one-volume edition of J. G. Frazer's *The Golden Bough* (1923) offered a mass of interesting raw material and also the historically important discussion of the relations between religion and magic. A general survey of modern theories of religion was presented in Goldenweiser's *Early Civilization* (1922) where such closely associated topics as primitive mentality were likewise considered. Summarizing some of the points of general interest on this subject, it may be said that G. Elliot Smith's school stood alone in tracing all religious customs and beliefs of primitive peoples, even animism, to ancient Egypt. Father Schmidt, from a comparison of the rudest tribes, inferred that Lang was right in crediting to an archaic stage a relatively pure monotheism, a theory set forth in the reviews of *Anthropos* and in Kopper's above-mentioned book.

Archbishop N. Söderblom in *Das Werden des Gottesglaubens* (1916) accepted belief in the existence of a creator on the most primitive levels, but regarded Schmidt's and Lang's description of his ethical perfection as exaggerated. He furthermore advanced the interesting theory that even more basic in religion than the idea of divinity or spirit is that of holiness, a view adopted in R. Thurnwald's *Psychologie des Primitive Menschen*. Somewhat comparable views had been voiced by R. R. Marett in *The Threshold of Religion*. American scholars for the most part were content to give theoretical interpretations of specific aspects of religion. Thus, F. Boas in *Mythology and Folk Tales of North American Indians* (*Journal of American Folk-Lore*, 1914) discussed the relations of myth and tale; P. Radin (*ibid.*) surveyed the *Religion of the North American Indian* on its subjective side; and R. H. Lowie's *Ceremonialism in North America* (*American Anthropologist*, 1914) considered the objective side of religion and connected it with æsthetic impulses.

In the general subject of culture-history no comprehensive work appeared, but two special studies merited attention. W. Koppers gave a convenient survey of the investigations hitherto made of the economic life of savages (*Die Ethnologische Wirtschaftsforschung*, *Anthropos*, vol. x-xi, pp. 611-651 and 971-1079). In B. Laufer's *The Reindeer and its Domestication* sinological and ethnographic research were combined to determine time and place of the first

domestication of this species, which seemed to have occurred about the beginning of our era in the vicinity of Lake Baikal. For notices of other papers by Laufer of a culture-historical nature, see *ETHNOGRAPHY*, section *Asia*; also *ANTHROPOLOGY*.

ETTLINGER, KARL (1882-). One of the foremost humorists of Germany, born in Frankfurt. On leaving college he was successively engaged in banking and printing, and finally became editor of the magazine founded by the late Georg Hirth, *Jugend*. Among his numerous works are: *Der neue Martial* (1905); *Ovids Liebeskunst* (1905); *Das Tagebuch eines glücklich Verheirateten* (1906); *Unsere Donna* (1907); *Der neue Juvenal* (1907); *In Freiheit dressiert* (1908); *Streifzüge eines Kreuzvergnugten* (1910); *Die Hydra*, a comedy (1911); *Scherzo*, a one-act play (1913); *Mister Galgenstrick* (1915); *Aus frohem Herzen* (1915); *Benno Stehkragen* (1917); a volume of war verse, *Lieder eines Landsturmmannes* (1919); *Das Verhältniss* (1920); *Die duldsame Eva* (1921).

EUCKEN, RUDOLF CHRISTOPH (1846-1926). A German philosopher (see VOL. VIII). After 1914, he published *Geistige Forderungen der Gegenwart* (1918), *Der Sozialismus und seine Lebensgestaltung* (1920), and his autobiography, *Lebenserinnerungen, ein Stück deutschen Lebens* (1921). All three works were translated into English.

EUGENE, ARCHDUKE (1863-). An Austrian soldier, born in Moravia. In his earlier years he served in the army, but retired on account of ill health. At the outbreak of the War he again entered the service, and after the Austrian retreat in Serbia in 1914, was given command of a portion of the Austrian troops. After the entrance of Italy in the War, he commanded the southwestern front, and achieved great success at Isonzo and elsewhere. He retired from active service in January, 1918.

EUGENICS. The term eugenics has come into common usage and as usually understood means applied human genetics. Genetics (see *HEREDITY* and *ZOOLOGY*) is primarily concerned with heredity as a biological phenomenon and is a true experimental science, but, since for obvious social reasons experiments in human breeding are impossible, geneticists give the problems of human heredity little attention. Several organizations and a few institutions have devoted themselves to the consideration of the results obtained by the study of heredity in general, in the effort to apply them to man, or at least to point the way to the betterment of human stock. This conception constitutes the eugenic ideal, which in its modern scientific form arose in England where Francis Galton did more than any one else to crystallize it. Himself a great student of heredity and a firm believer in man's ability to improve his own stock, he left a bequest to the University of London in 1910 for the support of a eugenics laboratory, with the objective of "a study of the agencies under human control which may improve or impair the racial faculties of future generations physically and mentally."

About the same time the Eugenics Record Office was established at Cold Spring Harbor, N. Y., and the Eugenics Education Society of England was founded under the leadership of Leonard Darwin. These initial movements led to the successive organization of societies and in-

stitutions in all English-speaking countries, as well as among the nations of western Europe. Following the War, interest was renewed in the eugenic question. The movement spread to China, Japan, and Latin America. Thus the eugenic movement became international, but even as early as 1912 an International Eugenics Congress was held in London. The War prevented a reconvening of this congress until 1921, when it assembled in New York. For this occasion many of the world's foremost biologists gathered. The scientific contributions to this congress were published in two large volumes under the title of *Eugenics in Race and State*. The congress also presented an exhibition of materials, methods, and results of research in heredity in general and the human problem in particular.

To understand the eugenic movement fully one should note the large part medicine, criminology, and education have taken in preparing its background. Medical and social students have long realized that while environment is a large factor in determining the fate of the individual, it could not do everything for him. He must bring with him a normal and efficient organism. Long ago the hereditary nature of a few types of mental and bodily inadequacy were recognized and measures taken to prevent the propagation of these abnormalities. Criminologists, running down the family histories of delinquents, revealed a greater tendency for a repetition of these offenses in their offspring than among the offspring of non-offenders. Consequently, in the United States, health boards and charity commissions began to advocate legislation for the segregation and also the sterilization of the incompetent and the delinquent. Laws were passed in 1913 authorizing the sterilization of the unfit in North Dakota, Michigan, Kansas, Oregon, Wisconsin, California, and Iowa. During the same year legislation restricting marriages was enacted in England, Spain, New Zealand, and elsewhere. In the United States, fifteen states had passed such laws by 1924, though much of this legislation was inoperative.

The greatest stimulus to the general consideration of eugenics was the Wisconsin marriage law of 1913, which required medical certification for all who applied for licenses. This brought on a nation-wide discussion and attempts at similar legislation in other States.

In the United States there are two active organizations, the Eugenics Research Association and the Eugenics Society of the United States of America. The effort of these organizations is, in the main, to stimulate research in human heredity and the effects of early surroundings. Although, as already stated, the basic conception of eugenics is the improvement of the human stock, these organizations have not only stimulated scientific research in the laws of heredity, but have taken a hand in problems of social delinquency. All organized charitable and corrective agencies now critically study their cases and are using the technique developed by the eugenicists for gathering family histories and other data bearing upon the cases of inadequacy and delinquency with which they have to deal. In this way were brought about such studies as that of the Tribe of Ishmael in Indiana, for example. The eugenicists have also stimulated the scientific study of families in the United States.

At the meeting of the International Commission in Sweden in September, 1923, representatives of England, Denmark, Norway, Sweden, Holland, Switzerland, and the United States were present. In all these countries provision was made for searching studies of the population. An understanding of the biological elements entering into national heritages was sought as a basis for a sound policy of conserving and strengthening the quality of their respective citizenries.

Sweden was the first nation to set up an institute for the study of race-biology. In 1918 the University of Upsala subsidized the research of Professor Lundborg into the lineage of peasant families, and he also received small grants from the government. Professor Lundborg's researches were so promising that the Swedish Parliament appointed a commission in 1920 to consider the needs of a national institute for the study of race-biology, which reported favorably. Consequently such an institute was founded and located at Upsala. Professor Lundborg was its director. This institute inaugurated an intensive study of the nation's population, province by province. See **ABORTION**.

EULENBERG, FRANZ (1867—). A German economist, born and educated in Berlin. He began teaching in Leipzig in 1899. From there he went to Aachen, and in 1919 became professor of political economy and statistics in the University of Kiel. His works include: *The Possibility and Results of a Social Psychology* (1900); *Society and Nature* (1905); *The Modern Philosophy of History* (1907); *The International Money Market* (1908); *The Rise in Prices during the Last Ten Years* (1912); *Money in War* (1915); *The New Industry* (1919), and numerous magazine articles.

EUPEN, MALMEDY, and MORESNET. To satisfy Belgian demands for protection and for reparations, Articles 34-39 of the Treaty of Versailles provided for the cession to Belgium by Germany of the frontier districts of Eupen (area 68 square miles; population, 26,156), Malmédy (area 314 square miles, population 34,768), and the disputed neutral district of Moresnet (area 2 square miles; population, 3038), together with a small portion of Prussian Moresnet. The regions in question had undergone steady Germanization since their acquisition by Prussia in 1815, so that the end of the War saw the original Walloon population so reduced that only one-sixth of the population could speak French. In fact, in Eupen the French-speakers were insignificant, though in the town of Malmédy 94 per cent spoke French. Likewise, in Moresnet, 48 per cent of the inhabitants were French-speakers, but it is to be noted that only 2 per cent spoke French exclusively. To the Peace Commissioners, other considerations were weightier than the question of language, which made the transfer of territory justifiable. Aside from the strategic argument, it was maintained that the orientation of the districts was toward Belgium, that there were profound historical ties, and that the necessity for compensating Belgium for the forests destroyed during the War favored the decision. For this last reason, too, Germany was compelled to turn over to Belgium the domainial and communal woods of Prussian Moresnet. Germany protested that the wishes of the population had not been consulted and that the

method provided by the Treaty for ascertaining the popular will with regard to the maintenance of German sovereignty, i.e. through the signing of open registers under the surveillance of the Belgian authorities, implied a bald negation of the principle of self-determination. Subsequent events lent some color of truth to this contention, for in the six months allowed by the Treaty only a few hundred persons dared to register openly their belief that the districts ought to be returned to Germany. Belgium, therefore, took final possession, despite plainly expressed German disapproval.

EUROPE. The Great War (1914-1918) and the revolutions in Russia, Austria-Hungary, and Germany which attended it led to a profound metamorphosis in European political geography. The cataclysmic changes registered in the peace settlement of Paris (1919-1920) with subsequent modifications and supplementary arrangements, surpassed in scope and significance such stages in the evolution of the modern state-system as were signalized by the Treaties of Westphalia (1648), the Peace of Utrecht (1713-1714), and the Congress of Vienna (1814-1815). The territorial readjustments consummated during the period 1918-1924 involved directly or indirectly every state in Europe except Portugal, Spain, and Switzerland. Western Europe, where the first truly national states had emerged centuries before, where political democracy had early achieved conspicuous successes, where the main bloc of the victorious Entente Powers was situated and where political revolutions did not sweep away long established institutions, was little transformed, the most notable exceptions being Alsace-Lorraine and Ireland (q.v.). Central and Eastern Europe, on the other hand, were almost completely reorganized on a national basis and to a large extent republicitized and democratized. The three great non-nationalistic empires of Austria-Hungary, Russia, and Germany (qq.v.) were dismembered and the diminutive state of Montenegro disappeared. A solid belt of eight new national states emerged in Central Europe, viz.:—Austria, Hungary, Czecho-Slovakia, Poland, Lithuania, Latvia, Estonia and Finland (qq.v.), while contemporaneously the respective national unifications of Italy, of Serbia, of Rumania, and of Greece were virtually completed and the nationalistic grievances of France and Denmark adequately redressed through the restitution of Alsace-Lorraine and Northern Schleswig (qq.v.). Such in broad outlines, was the territorial resettlement of Europe.

The age-long movement for home-rule for Ireland eventuated (1921-1922) in the establishment of a new self-governing, democratic British dominion—the Irish Free State—with a special status for six Protestant counties of Ulster under the Act of 1920. On the continent of Europe the abasement of Germany's power and prestige correspondingly exalted the democratic republic of France to a position as foremost military state. Her eastern boundary was definitely rectified through the retrocession of Alsace-Lorraine. In addition the French exercised virtual control over the inter-Allied civil commission supervising the occupation of the Left Bank of the Rhine, enjoyed a special economic status in the Saar Valley (q.v.) which was politically separated from Germany for 15 years and placed under a League of Nations Commission dominated by the French, and finally,

through the forcible seizure of the Ruhr (January, 1923), greatly though temporarily augmented the area of German territory actually controlled by France. The kingdom of Belgium was liberated from the permanent and international guaranteed neutralized status imposed upon her by the settlement of 1839. She also acquired from Germany the diminutive districts of Eupen, Malmédy and Moresnet (q.v.). An attempt to secure the annexation of the Left Bank of the Scheldt from neutral Holland failed, but in 1920 a special convention freed Belgian navigation on that waterway from onerous Dutch restrictions. By a subsequent arrangement (May, 1921) the Grand Duchy of Luxemburg though retaining political independence promised henceforth to conform its tariff, coinage, and railways to those of Belgium.

Germany emerged from the Great War and from her political revolution a democratic republican national state somewhat diminished in size and subjected to burdensome penalties by the Treaty of Versailles, but nevertheless populous and potentially strong. In addition to her loss of territory in the west to Belgium and to France, and in the north to Denmark, she was obliged to cede the greater part of Posen, West Prussia and Upper Silesia (q.v.) to Poland, to relinquish the Baltic port of Memel (q.v.) for eventual assignment to Lithuania (1923) and to consent to the internationalization of the port of Danzig (q.v.) under League of Nations auspices and the accordance of a specially privileged status therein to Poland.

Even more striking than the partial dismemberment and political regeneration of Germany was the complete disintegration of the great Dual-Monarchy of Austria-Hungary. After the revolution of 1918 and the Treaty of St Germain of 1919 Austria constituted but a small land-locked German state on the Danube with an area of less than 33,000 square miles, whereas Hungary, by a similar process of revolution and the Treaty of Trianon of 1920, shrank to be a minor Magyar realm of some 36,000 square miles immediately to the east. The other regions in erstwhile subjection to the Habsburg sceptre were either assigned to victorious neighbors—Italy, Serbia, and Rumania—or incorporated in the newly recreated states of Poland and Czecho-Slovakia. Italy acquired Trentino, Trieste, part of Austrian Tirol (q.v.), Gorizia and Gradisca, Istria, Fiume (q.v.), Zara and certain Dalmatian Islands. Slovenia, Croatia-Slavonia, Dalmatia, Bosnia-Herzegovina, and the western Banat (q.v.), together with certain small Bulgarian districts, were united with Serbia and Montenegro under the Serbian monarch to form the unitary kingdom of Serbs, Croats, and Slovenes (Jugo-Slavia). The principality of Albania successfully asserted and maintained its independence against both Jugo-Slav and Italian encroachments, but its exact boundaries long remained undefined. In addition to slight rectifications of her boundary with Jugo-Slavia on the west, prescribed by the Treaty of Neuilly (1919), the kingdom of Bulgaria was obliged to cede a substantial portion of Thrace (q.v.) to Greece, being thereby rendered non-contiguous with the Aegean Sea. Greece not only gained Bulgarian Thrace, but also part of Turkish Thrace, Smyrna, Gallipoli, and the Dodecanese by the Sèvres settlement of 1920 only to be forced to relinquish these latter regions as a result of her military *débâcle* in the war with Tur-

key and the humiliating Treaty of Lausanne (1923) which was in no small degree responsible for her republicanization in 1924. The Turkish Empire was definitely debarred from Europe by the Treaty of Sèvres only to be nationalized, republicanized, and democratized by the regenerative movement under Mustapha Kemal Pasha and make a triumphal reëntry into the European family of nations through the reacquisition of Adrianople and Thrace by the Treaty of Lausanne (1923). To the kingdom of Rumania were annexed the eastern Banat, the whole of Transylvania and the Russian province of Bessarabia (qq.v.). The ancient kingdom of Bohemia reappeared in the form of the Republic of Czecho-Slovakia in which were embraced not only Bohemia, Moravia and part of Austrian Silesia, but also the region of Slovakia and Carpathian Ruthenia long merged in the kingdom of Hungary, part of German Upper Silesia and parts of Teschen, Zips and Orava (q.v.) as shared with Poland.

Poland, grievously partitioned by powerful neighbors in the late eighteenth century, was reborn under a republican régime at the end of the Great War, thanks to the Russian Revolution and the defeat of the Central Powers. To her territorial resurrection, Germany, Austria-Hungary and Russia all made substantial contributions. The Russo-Polish frontier remained uncertain during several years of hostilities (1919-1920) but was definitely demarcated by the Treaty of Riga (1921). To the north of Poland had been established (1918-1920) a fringe of small states on Russia's western border, namely the republics of Lithuania, Latvia, Esthonia, and Finland (qq.v.). With Lithuania, Poland had a protracted dispute over the city of Vilna (q.v.) and vicinity which finally terminated in Poland's favor with the annexation of the whole southwestern half of Lithuania. Lithuania, however, successfully thwarted (1923) the Franco-Polish attempt to forestall her acquisition of the Baltic port of Memel as contemplated in the Versailles settlement with Germany. Finland, emancipated from Russia after a long struggle for autonomy and independence, was temporarily embroiled in a dispute with Sweden over the possession of the Åland islands (q.v.) in the Baltic Sea. Norway, granting independence to Iceland (q.v.) in 1918, which nevertheless retained the Norwegian king as its monarch, was compensated for this diminution of area by a treaty signed at Paris in 1920 assigning her the Arctic archipelago of Spitzbergen (q.v.), comprising some 25,000 square miles.

Russia, losing territory all along her western border, and renouncing imperialistic ambitions in Turkey, Persia, Afghanistan, and China, was gradually reconstructed by the Soviet government on the basis of a federation of autonomous Socialist republics—Ukraine, Transcaucasia, White Russia and Great Russia. See WAR IN EUROPE.

EUROPEAN WAR, 1914-1918. See WAR IN EUROPE.

EVANGELICAL ASSOCIATION. See EVANGELICAL CHURCH.

EVANGELICAL CHURCH. Established Oct. 14, 1922, by union of the Evangelical Association and the United Evangelical Church. The Evangelical Association was the outgrowth

of a religious movement started in Pennsylvania in 1800 by the followers of Jacob Albright. After many years, differences arose in the church which culminated in 1891 in a division, a considerable number of ministers and members organizing themselves in 1892 into the denomination known as the United Evangelical Church. At the end of the second decade of separation the growing conviction that the two churches should be reunited began to find articulate expression. The act of merger was the consummation of 12 years of negotiation.

The Evangelical Association increased in number of communicants from 150,380 in 1914 to 167,416 at the time of merging, in number of pupils in the Sunday schools from 227,820 to 271,758, and in the valuation of its churches and parsonages from \$11,699,452 to \$16,281,011. Similarly, the membership of the United Evangelical Church was increased from 79,292 in 1914 to 92,001 at the time of merging, and the total value of church property from \$5,476,602 to \$9,515,328. In 1923 the Evangelical Church had 244,072 church members and 391,207 pupils in the Sunday schools, 2663 churches, 1878 itinerant ministers, and 562 local ministers; and church property in the United States and Canada valued at \$23,917,585. It carried on mission work in 31 States, Canada, Germany, Switzerland, Latvia, France, China, Japan, and Africa.

EVANGELICAL CHURCH, UNITED. See EVANGELICAL CHURCH.

EVANS, EDWARD RADCLIFFE GARTH RUSSELL (1881-). A British explorer (see VOL. VIII). In 1914, he commanded the *Mohawk* in the bombardment of the right wing of the German army on the Belgian coast and in 1917 took command of the *Broke*. He was awarded the Royal Humane Society's silver medal in 1921, and has been honored and decorated by many other societies. He published *Keeping the Seas Down* (1920), *South with Scott* (1921), and others.

EVANS, RUDOLPH (1878-). An American sculptor born at Washington, D. C. He studied at the Corcoran Art School, Washington, the Art Students' League, New York, Julien's Academy and the Ecole des Beaux Arts, Paris. He was a pupil of Falguière and Rodin and was elected Associate of the National Academy in 1919, when he won the Watrous gold medal. His best known sculpture is the "Golden Hour," the original of which is in F. A. Vanderlip's garden at Scarborough, N. Y., a copy in the Luxembourg Museum, and a marble replica in the Metropolitan Museum, New York. Mr. Evans has the capacity to catch in his portraits the aloofness of childhood. Besides portraits of young people, he has made monuments and portrait busts of financiers, including Frank A. Vanderlip, John D. Rockefeller, Jr., and Thomas F. Ryan. His superb "Boy and Panther" was exhibited in 1923.

EVANS, WILLIAM (1870-). An American theologian, born at Liverpool, England, and educated in private schools in England and at the Moody Bible Institute (Chicago), the Chicago Lutheran Theological Seminary, and the Theological Seminary of the University of Chicago. He was ordained in the Congregational ministry in 1894, and was appointed to his first pastorate in the following year. In 1901, he became director of the Bible course at the Moody Bible Institute, where he remained until he was

appointed associate dean (1915) of the Bible Institute in Los Angeles. He resigned this position in 1918, becoming director of Bible conferences for the United States and Canada. He is the author of: *The Book of Books* (1902); *How to Memorize* (1909); *Outline Studies in Bible Books* (1909); *Personal Soul-Winning* (1910); *Studies in the Life of the Christian* (1911); *The Great Doctrine of the Bible* (1912, 1920); *How to Prepare Sermons* (1913); *Through the Bible—Series of 10 Volumes on Bible Exposition* (1916-18; incomplete); *The Book Method of Bible Study* (1915); *Epochs in the Life of Christ* (1916); *The Shepherd's Psalm: a Meditation* (1921); *The Coming King. the World's Next Great Crisis* (1923).

EVARTS, HAL G. (1887-). An American author born at Topeka, Kan. After a varied career as rancher, trapper and licensed guide, he turned to writing. He published: *The Cross Bull* (1920); *The Bald Face* (1921); *Passing of the Old West* (1921); *The Yellow Horde* (1921); *Tumbleweeds* (1922); *Fur Sign* (1923).

EVE, ARTHUR STEWART (1862-). A Canadian physicist, born at Silsoe, Bedfordshire, England. He was educated at Cambridge, and in 1903 became Macdonald professor of physics, McGill University, Montreal, Canada. He commanded the 148th Overseas Battalion in the War, and was director of research, Admiralty Experimental Station, Harwich, 1917-18. In 1919, he became director of physics at McGill University. He has published various papers on radioactivity and ionization.

EVERWIJN, JAN CHARLES AUGUST (1873-). A Dutch diplomat born at Noorwijk, Holland. He studied law at Leiden University, and was a lawyer at The Hague (1897). Among his government posts have been: vice-president of the commission of the Netherlands, participation at the Panama-Pacific Exposition in San Francisco (1913); various economic negotiations (1914-19); president of the Netherlands Organization for the International Chamber of Commerce (1920); delegate at the Paris Conference (1920); envoy extraordinary and minister plenipotentiary from the Netherlands to the United States (1921-).

EVJEN, JOHN OLUF (1874-). An American educator, born at Ishpeming, Mich., and educated at Augsburg Seminary (Minneapolis), the University of Minnesota and the University of Leipzig. In 1903, he was ordained in the Lutheran ministry. From 1909 to 1919, he held the position of professor of theology at Augsburg Seminary and in the latter year became president of the State Normal School at Mayville, N. D. Besides contributing to periodicals and encyclopædias, both German and American, he is author of the following: *Die Staatsumwälzung in Dänemark im Jahre 1660* (1903); *Scandinavia and the Book of Concord* (1905); *En Boganmeldelse* (1910); *Et Kapitel fra Symbolforpligtelsens Historie* (1911); *Lutheran Germany and the Book of Concord* (1911); *Scandinavian Immigrants in New York, 1630-1674* (1916); *Naadegaverne og Embedet* (1920); *The Teachers' College—Its Place in the Educational System* (1920).

EVOLUTION. See ANTHROPOLOGY; BOTANY; HEREDITY; ZOOLOGY.

EWART, JAMES COSSAR (1851-). A Scottish naturalist (see VOL. VIII). His later books include: *Domestic Sheep and Their Wild*

Ancestors (1913); *Development of the Horse* (1915); *Mounting of the King Penguin*; *Nesting Feathers of the Mallard* (1921).

EWELL, ARTHUR WOOLSEY (1873-). An American physicist (see VOL. VIII). He was appointed commanding captain of the United States Reserves on Dec. 15, 1917, and head of the bomb unit of the Air Service of the American Expeditionary Forces. After the Armistice, he was placed in charge of the experimental development and tests of bombs.

EWING, JAMES (1866-). An American pathologist (see VOL. VIII). In 1919 Dr. Ewing brought out his monumental work on tumors, entitled *Neoplastic Diseases*.

EXPLORATION. With the changed conditions which arose among the nations in 1914-24 came new methods and special aims in exploration. Apart from the enormous unvisited areas of glacier-covered Antarctica and the unknown regions of the Arctic Ocean, no lands of extent remained in 1924, and such as there were could be easily reached by airplane. Except by Americans, new exploration ceased during the War, but later it revived. With the accession of new territories by mandate, the victorious nations diligently applied themselves to ascertaining the extent and variety of natural resources suitable for exploitation. Climate, fauna, flora, minerals, and soil conditions, needed study in order to foster emigration or to increase essential raw materials. Such considerations largely controlled explorations by Europeans. American expeditions were sent forth for the increase of knowledge and the advancement of science. Institutions of learning and progressive museums applied their energies to researches to enlarge their representative exhibits and so make them more useful for scientific study and public edification. American research, especially in the later years, was engaged in the accumulation of data, archaeological and geological, which might enable scientists to write the story of prehistoric races definitely and to trace the methods of biological evolution.

Africa. See **AFRICA, Explorations**.

Asia. The most important researches were those in the Mongolian deserts, which were explored geologically, as well as with respect to geography, physiography, and palaeontology. Fossil vertebrates were discovered in large numbers and varieties. Berkey stated that the geologic core of Asia is now known, and Osborn looks to the elucidation of man's origin by later research. The Swedish expedition made extensive biological explorations in Kamchatka. Stein's expeditions, 1913-16, covered large interior areas, especially along the Persian-Afghanistan border, a ruined Buddhist monastery furnishing interesting archaeological data. British explorers twice crossed the interior deserts of Arabia, and twice failed to attain the summit of Everest, and also Mt. Raeburn, the third highest peak. On Everest an elevation of 27,300 feet was reached, within 1700 of the summit; this was the highest point ever attained.

The Palestine Exploration Fund, under Macalister, continued excavation of the City of David, whose history extends back more than 2000 years. The British Archaeological School excavated a Phœnician City. Italians made anthropological researches in Eritrea and among the Buddhist antiquities of Afghanistan.

Arabia. See **ARABIA, Explorations**.

Australia. Extended exploitations in Western Australia threw new light on the vast areas of thousands of square miles hitherto classed as deserts incapable of economic utilization. Much of the region was said to have a fertile soil, watered by a scanty rainfall. Irrigation, conserving the rain by reservoirs, should make it a region fit for agriculture. Oil resources were indicated.

Europe. Excavations in France and Italy disclosed ancient ruins of unknown periods. Ethnographic researches were made in southern France and northern Spain. The construction of a war railway to the Murman Coast brought scientific knowledge of the hitherto unknown region of the Kola Peninsula.

North America. Canada. The Ministry of the Interior continued its researches into the resources of the Dominion. A water power inventory placed the resources at 32,000,000 horse power. The Arctic archipelago was explored and police, customs, and postal service established. In the Mackenzie district, bitumen, coal, copper, gold, and oil were located and exploited. National parks (one for bison) were surveyed; their total area was over 6,000,000 acres. Forest reserves cover 36,000 square miles. The movements of the magnetic north pole and correlated phenomena were scientifically determined. At the University of Toronto extended researches were carried on with the helium gas of western Alberta. See also **POLAR RESEARCH**.

United States. Scientific field research was annually pursued by scores of American universities and scientific societies. Space does not permit even brief allusion to their extensive additions to human knowledge. A few may be mentioned whose work was of international interest.

Chicago Field Museum. Under Director Davies about 30 field parties were sent forth, covering all continents except Europe. The home work in 10 States was principally botanical and zoological. Researches were made in the fauna and flora of 10 of the countries of South America, birds and mammals were particularly studied. In China and India the work covered ethnology, in Mesopotamia archaeology, and in Canada and Argentina palaeontology.

American Indian Heye Foundation. Its unearthing of two of the fabled Seven Cities of Cibola yielded information on prehistoric Indian life, which, preceding the Zufi period, was thought to extend backward 1000 years.

American Museum of Natural History. Dr. Osborn continued the supervision of its research work covering most regions of the northern hemisphere. Most important were the biological surveys of eastern Asia (Burma, China, and Mongolia), and northern South America (Brazil, Chile, and Ecuador). In this work Andrews, Anthony, Chapman, Cherrie, Faunthorpe, Miller, Tate, and Vernay won distinction. Very notable and promising in its results was the discovery and exploitation of the wonderful fossil

fields of Mongolia, with their rich yield of mammals, cretaceous and tertiary fossils, etc. Akeley and Lang's African mammals were also important.

Pennsylvania University Museum. Under Gordon, its field work largely consisted of archaeological researches which met with marked success. In Egypt Fisher's excavations at Giza, Memphis, and Thebes revealed papyri and other articles of historic value. Woolley, co-operating with the British Museum in Mesopotamia, at and near Ur explored ruins extending back 6400 years; they added 1000 years to Babylonian history. Fisher's excavations at Beth Shean in Palestine disclosed eight superimposed cities, Arabic, Byzantine, Crusader, Egyptian, Grecian, Roman, and Scythian. These periods cover about 4000 years of history. Farabee's years of research in the watershed of the upper Amazon made valuable ethnological and archaeological contributions. Especially important were those relating to the Carib and other tribes along the borderland of Guiana and in Chile and southern Peru.

Carnegie Institute. This organization maintained its research activities in astronomy, chemistry, embryology, genetics, geophysics, history, and magnetism. Notable were the study of the Maya civilization and the astronomical work through the 100-inch telescope on Mt. Wilson. Most important were the survey cruises of the *Carnegie*, including coöperative work, which brought the total of magnetic stations to about 10,000 in hitherto unexplored regions. A new analysis of the earth's magnetic field for 1922 disclosed three magnetic systems, internal, external, and non-potential, the first constituting 94 per cent of the total and the last two about 3 per cent each; it also disclosed a decrease of 5 per cent, during the past 80 years, and an annual loss of one part in 1500. Continued investigations of atmospheric electricity on land and sea showed that for a large component of the daily variation the maximum and minimum occur, roughly, simultaneously. Comprehensive programmes were inaugurated for the investigation of correlations between terrestrial magnetism, atmospheric electricity, and earth currents.

National Geographic Society. Researches were extended and successful. In Peru, Bingham unearthed the lost city of Machu Picchu, of the prehistoric period. In Alaska, five expeditions under Griggs surveyed the volcanic Mt. Katmai region, devastated by the most violent eruption in modern times; it has been proclaimed a national monument. In New Mexico, Judd excavated the communal dwelling of the Bouitas, thought to be prehistoric Indian people.

Smithsonian Institution. Organized for the increase and diffusion of knowledge among men, the Institution with its eight bureaus, including the Bureau of Ethnology and the National Museum, uninterruptedly carried on extensive field work and scientific research. The Institution covered by its scientific surveys the less known regions of Africa, Asia, North America, South America, and Oceania, with the adjacent islands. Fauna, flora, archaeology and ethnology were the principal subjects, although astronomy, geology, and other physical sciences were studied. The Bureau of Ethnology largely applied its researches, with marked success, to the ethnology of the American Indian, present and prehistoric.

Oceanography. Besides currents, depths, and deposits, research turned to marine biology, especially to the breeding, growth, and migration of edible fish. The United States thus investigated its coast waters, and European scientists—British, Danish, French and Swedish—explored the North Sea, the Mediterranean, and Atlantic waters from the English Channel to Madeira. Great Britain was studying the biology of the whales, etc., of the waters of the Falkland Island Dependency. After 1914 an American ice patrol located and warned shipping of dangerous ice in the North Atlantic.

Miscellaneous. Under a tropical expert, Beebe, a biological survey was made of the Galapagos Islands.

EXPLOSIVES. Such developments of the War as the tremendous increase in the expenditure of artillery ammunition for preliminary bombardment of objectives, in barrage fire for protection of infantry waves advancing to the attack, in harassing fire directed on enemy back-areas, in counter-battery work, in putting up aerial barrages to fend off enemy airplanes, and the enormous increase in the employment of machine guns in lieu of the slower-firing shoulder rifle, all magnified the rôle of explosives. Progress in their manufacture was mainly toward quicker manufacture, greater safety in handling, storage, and transportation, slower deterioration after manufacture, and substitution of more abundant raw materials for those found to exist in quantities too small for ready conversion on a hitherto unprecedented scale.

Propellants. Smokeless powder in various forms was in universal use prior to the War, and except for the substitution of wood pulp for cotton linters in the manufacture of nitrocellulose and the development of a water-drying process which was much quicker than the former air-drying process, no outstanding improvements in its manufacture were achieved during the War.

Probably the most important development work carried on in 1924 was on a smokeless, flashless, non-hygroscopic powder. Immediately after the Armistice, demands were made for a new type of propellant powder to meet such conditions as those of the War. The particular objection to the service powder of the United States army was that it was hygroscopic and must be kept in waterproof containers up to the time of use. Another very important factor was that it was a solvent powder, requiring considerable time for drying, even making use of the so-called water-drying process developed during the War. Several experimental powders of varying composition and granulation passed satisfactory tests. In order to obtain necessary ballistic properties and yet avoid the use of solvents, nitroglycerine in very small amounts was incorporated with the other ingredients. This powder can be fired within 48 hours after manufacture but greater uniformity is obtained by allowing it to age for several days. It is completely non-hygroscopic; samples have been fired immediately after submersion in water for 24 hours.

Bursting Charges. Just prior to the War, trinitrotoluol (TNT) was considered the most satisfactory bursting charge for mobile artillery shells. Because of the scarcity of TNT during the War, a fairly satisfactory substitute was developed and used, 80% amatol, a mixture of

80 parts of ammonium nitrate and 20 parts of TNT. Small-caliber shells were filled largely with 50% amatol, but at best this was a temporary expedient; the standard practice in 1924 was to use TNT without dilution. The 80% amatol was prepared by crushing and drying ammonium nitrate, melting TNT in steam-jacketed kettles, and mixing the two components in the required proportions in a steam-jacketed mixer. The resulting product resembled soft brown sugar and might be tamped into the shell cavity by hammer and mallet or, as was done during the War, by means of the screw shell-filling machine, which consists of a hopper to hold the amatol in bulk and a sleeve containing a rotating worm. The shell to be filled was mounted horizontally on a wheel carriage placed so that the worm and sleeve entered it within a few inches of the bottom of the shell cavity. The amatol was fed into the shell by the rotating worm until the resistance to the entrance of more amatol caused the carriage and shell to back off from the hopper, when the worm was automatically stopped, since the cavity had been filled to a predetermined point. The remaining cavity left by the sleeve and worm was filled with liquid TNT except for a small cavity to take the booster. See COKE.

Ammonium picrate, called explosive D in the United States Service, is used for bursting charges of armor-piercing projectiles, since TNT is not sufficiently insensitive to shock to withstand passage through armor plate on impact without exploding. Ammonium picrate will do this and still be in condition to give effective fragmentation on perforation of heavy armor plate. In loading ammonium picrate in armor-piercing projectiles, small quantities of the crystalline explosive are given a preliminary amount of tamping in the nose of the shell, followed by hydraulically pressing successive increments as needed to fill the shell cavity completely and with proper density. The bursting charge for shrapnel continued to be black powder, according to standard practice prior to the War. The ammunition used with trench mortars developed during the War was filled with a nitrostarch explosive for the smaller calibers and either 80% or 50% amatol for the larger calibers. Hand grenades were loaded principally with nitrostarch, and rifle grenades with compressed TNT. Aircraft bombs were loaded

with 80% amatol during the War; 1924 practice was to use TNT without dilution.

Booster Charges. During the War attempts were made to load boosters with tetryl around the fuse socket, filling the remainder of the booster with TNT. This was abandoned in favor of completely filling the booster with tetryl. This practice was standard in 1924.

Detonators. In the decade 1914-24, mercury fulminate maintained its position as the premier military detonator. It is manufactured by dissolving mercury in nitric acid, pouring the solution into grain alcohol, and removing and washing the gray crystals of mercury fulminate thus precipitated. Mercury fulminate is the most sensitive, most powerful, and most expensive of military explosives. It costs more than twice as much as tetryl and about five times as much as TNT. The bursting of an artillery shell is in reality a series of explosions. On impact with the ground the firing mechanism of the fuse delivers a minute flash to the mercury fulminate detonator. It detonates and transmits the explosive wave to the tetryl of the booster charge surrounding it. The booster in turn causes the detonation of the TNT in the main bursting charge of the shell. By utilizing this step-up method, small quantities of expensive and highly sensitive explosives are used to set off successively larger quantities of less sensitive explosives. See CHEMISTRY, ORGANIC; also ORDNANCE.

EXTENSION TEACHING IN AGRICULTURE. See AGRICULTURAL EXTENSION WORK.

EYDE, SAMUEL (1866-). A famous Norwegian engineer (see VOL. VIII). He organized, in 1916, a company for the manufacture of fertilizer out of saltpetre and in 1917 founded the *Norsk Sprængstofindustri*.

EYRE, LAURENCE (?-). An American actor and playwright born in Chester, Pa. He made his debut with the Castle stock company in Boston in 1907, played with Julia Marlowe, and also leading characters with the Ben Greet company. His best known plays include: *The Things That Count* (1914); *Sazus Matasus* (first full length play dealing entirely with Negro life, in which all the characters are colored, to be produced in America) produced at Atlantic City (1916); *Driftwood* (1917); *Mis' Nellie of N'Orleans* (1919); *Martinique* (1920). *Mis' Nelly of N'Orleans* was also produced by Dion Boucicault later in London.

F

FAESI, ROBERT (1873-). A Swiss poet, essayist and dramatist, born in Zurich. He studied at the universities of Zurich and Berlin. After some years of travel in France, Italy, Russia, and England, he returned to Zurich and published *Zürcher Idylle* (1908), *Odysseus und Nausikaa*, a tragedy (1911), and *Die offene Tür*, a comedy (1912). He wrote a volume of verse, *Aus der Brandung: Zeitgedichte aus der Schweiz* (1917), and compiled an anthology of Swiss poetry under the title *Gestalten und Wandlungen* (1920). His most important critical works are *Paul Ernst und die Neueren Bestrebungen im Drama* (1913), *Karl Spitteler* (1917), and *Rainer Maria Rilke* (1919).

FAHEY, JOHN H. (1873-). An American banker and newspaper publisher, born at Manchester, N. H. After receiving a high school education he became a reporter in Manchester. He was editor and publisher of the *Boston Traveler* 1903-10, finally becoming president of the Boston Traveler Company and of the State Publishing Company. He was also president and publisher of the *Worcester Post*. In 1919-20, he was chairman of the organizing committee of the International Chamber of Commerce, and in the following year American director of the same body. In the same period he was a member of the Senior Council of the United States Chamber of Commerce. Other offices held by him include membership in the United States section of the inter-American high commission, member of the American Chamber of Commerce in Paris, and honorary member of the Bolsa de Comercio of Buenos Aires. In 1920 he was made *Chevalier* of the French Legion of Honor and Commander of the Italian Order of the Crown.

FAHRENKROG, LUDWIG (CARL WILHELM) (1867-). A German poet-painter, born in Rendsburg. He studied at the art academies of Hamburg and Berlin and spent some years in Italy. His mural paintings soon attracted attention, among them "Youth as the Golden Age" in the Girls' High School of Barmen, a "Crucifixion" in Mulheim and a "Descent of Christ to Hell" in Kiel. He made a sensation at the Munich Exhibition of 1902 with his "Christ Preaching," in which he presented a beardless Christ, an innovation which he subsequently justified in his writings. He has since become better known as an author. His literary works are *Geschichte Meines Glaubens* (1906); the dramas *Baldur* (1908), *Woland* (1914), *Nornegast* (1921), and *Die Göttertochter* (1921); the poems *Lucifer* (1917) and *Das Goldene Tor* (1921), the latter illustrated by himself; and a history of God-lore, *Gott im Wandel der Zeiten* (1921).

F. A. I. (FÉDÉRATION AÉRONAUTIQUE INTERNATIONALE). See **AÉRONAUTICS**.

FAILURES OF DAMS. See **DAMS**.

FAIRBANKS, CHARLES WARREN (1852-1918). An American politician, Vice President

of the United States, 1904-09 (see Vol. VIII). In 1914 he was chairman of the Indiana Republican State Convention for the third time. In 1916 he was again nominated for the Vice-Presidency by the Republican national convention but was defeated in the campaign. He died in 1918.

FAIRBANKS, DOUGLAS (1883-). An American actor, born in Denver, Colo. He first appeared on the stage in New York in 1901. On the legitimate stage he played in *Hawthorne of the U. S. A.*, *Frenzied Finance*, *All For a Girl*, *A Gentleman of Leisure*, *Henrietta*, *The Show Shop*, and others. After 1916 he headed his own motion picture productions. His chief successes include *His Majesty the American*, *When the Clouds Roll By*, *The Mollycoddle*, *The Mark of Zorro*, *The Nut*, *The Three Musketeers*, *Robin Hood*, and *The Thief of Bagdad*.

FAIRCHILD, BLAIR (1877-). An American composer, born at Belmont, Mass. Simultaneously with his academic studies at Harvard University, he took courses in composition under J. K. Paine and W. R. Spalding; later he studied piano with G. Buonamici in Florence. In deference to his father's wish he returned to America and entered business, but went to Constantinople in 1901 as a member of the American Legation and thence to Persia. Finding that Persian music interested him more than his diplomatic duties, he decided to devote himself entirely to music and went to Paris in 1903 for further study under Widor and Ganaye. His style is a combination of French impressionism and Oriental elements. Among his works are a ballet pantomime, *Dame Libellule* (Paris, 1921); the symphonic poems, *East and West*, *Zal*, *Shah Feridoun*; a sketch for orchestra, *Tamineh*; *Légende* and *Etude Symphonique* for violin and orchestra; a violin sonata; two piano trios; a string quartet; a piano quintet; six Psalms for soloists and chorus à cappella; two fugues for organ; and many songs, almost all on Oriental themes.

FAISAL (1885-). King of Iraq, third surviving son of Hussein, King of the Hedjaz, born at Taif, Turkey. He received a modern education at Mecca and Constantinople and later took an active part in the Turkish government. On the restoration of his father to the emirate of Mecca in 1908, Faisal commanded the Arab contingent in the operations of the Turks against the Idrisi (1911-13). He was elected deputy for Jidda in the Turkish Parliament (1914), commanded the rebels at Medina in the Arab revolt against Ottoman (1916), commanded the northern forces of the Arabs (1917), and supported the Egyptian Expeditionary Force of the Allies. After the Armistice he set up a temporary government in eastern Syria and represented the Arabian cause at the Paris Peace Conference (1919). In March of the following year, he was proclaimed King of Syria by the Syrian national government, but the plan was overturned by the entry of the French troops into Damascus. The British government recog-

nized him as King of Iraq and head of the new state under its mandate of August, 1921. See MESOPOTAMIA.

FALKENHAYN, ERICH VON (1853-). A Prussian general, born at Burg Belchau, in Thorn. He entered the army in his youth, and became military attaché to the legation at Paris in 1887. In 1889 he acted as military instructor and favorite of the Crown Prince of Germany and Prince Eitel Friedrich. He served in China during the Boxer Rebellion. He was promoted to lieutenant-general and was made Prussian Minister of War in 1913. In 1914 he became chief of the general staff of the army, and later general of the infantry. He upheld the officers whose conduct in Alsace resulted in the Zabern disorders. He received the credit for the breaking through of the Russian lines at Gorlice-Tarnow in 1915, and also planned the successful Russian and Serbian campaigns of the same year. The unsuccessful attack at Verdun of 1916 caused his removal as chief of the general staff, Hindenburg taking his place. He was given the leadership of the Ninth army in its fighting at Hermannstadt, and in 1917 of the Asiatic Corps. In 1918 and 1919 the Tenth army was commanded by him. He wrote: *Die oberste Heeresleitung in ihren wichtigsten Entschliessungen 1914-16* (1919), giving an account of the German conduct of the War.

FALKLAND ISLANDS, DEPENDENCY OF. The creation of this dependency completed, in the western hemisphere, the accession of Antarctic regions initiated by Great Britain a century before. In 1832, she took possession of the Falkland Islands to protect her interests in the southern fisheries. By proclamation of July, 1908, this dependency was created as a distinct entity. It includes all lands and inclosed seas of that region southward from the Falkland Islands to the Antarctic Pole. In its limits are Caird, Coates and Leopold coasts, Graham Land, the Sandwich group, South Georgia, the South Orkneys and the South Shetlands. Argentina occupies its meteorological station on the South Orkneys by British permit, and the use of land stations for fisheries is possible only under licenses. The whale fishery of these seas is the most extensive in the world, and the catch of 1920-21 produced 435,000 barrels of oil, mostly taken by Norwegians. The British government began in 1923 an economic study of the food supply, habits, migration, etc., of the whales, and of other productive marine life in these waters. See ROSS DEPENDENCY.

FALL, ALBERT BACON (1861-). An American public official (see VOL. VIII). He was reelected to the United States Senate for the term 1919-25, but resigned in 1921 to become Secretary of the Interior at the request of President Harding. In June, 1921, the naval oil reserves were transferred to the Department of the Interior, and in 1922 Secretary Fall signed a long pending lease of the Teapot Dome oil district in Wyoming to the Sinclair oil interests, and also a lease of the reserves in California to E. M. Doheny, an oil magnate. Only about one-third of the oil was held for use of the navy. Later Fall resigned his secretaryship. In 1924 an investigation was begun by the Public Lands Committee of the Senate, and Fall appeared before a subcommittee and denied that he had received any money from Sinclair or Doheny, but on January 24, Doheny testified before the Committee that he had "lent" Fall

\$100,000 without security or interest. On July 15 he was indicted on three counts, the first and third relating to the alleged \$100,000 payment, the second charging conspiracy with Harry F. Sinclair in regard to the Wyoming or Teapot Dome leases, and entering into contracts without bids.

FALLA, MANUEL DE (1876-). A Spanish composer, born at Cadiz. He studied at the Madrid Conservatory under Tragó (piano) and Pedrell (composition), and while still a student wrote several zarzuelas which he offered to the managers in vain. Unable to obtain a hearing in his native land, he went to Paris in 1907, where, after some hard years, Debussy and Dukas became interested in him. After his first opera, *La Vida Breve*, written in 1904, had been successful in Nice (1913) and Paris (1914), it was brought out in several cities of Spain and won recognition for the composer. De Falla then settled in Granada. Although not a prolific writer, he is the acknowledged leader of Spanish futurists. His other works are the ballets, *El Amor Brujo* (Madrid, 1915), *El Sombrero de Tres Picos* (London, 1919), and *El Retablo del Maese Pedro* (Madrid, 1923), three pieces for orchestra, *Noches en los Jardines de España*, *En el Generalife*, and *Danza Lejana*; and piano pieces and songs.

FALL RIVER. A port of entry of Massachusetts, and the largest cotton manufacturing centre of the United States. The population rose from 119,295 in 1910 to 120,485 in 1920, to 120,912 by estimate of the Bureau of the Census for 1923, and to 130,800 by local estimate for 1924. The city in 1923 adopted the report of the city-planning board issued on its survey of the city begun in 1920. The number of persons employed in the cotton mills of the city increased from 35,000 in 1914 to approximately 40,000 in 1924, and the investment from \$34,000,000 to \$100,000,000. The largest fuel-oil refinery in New England, of 1,000,000 barrels monthly capacity, was built in 1922; in 1924, the first unit was begun of a power plant that would ultimately produce 275,000 horse power.

FARABEE, WILLIAM CURTIS (1865-1925). An American anthropologist who was born in Washington, Pa. He was in charge of the de Milhaud Harvard expedition, 1913-16, and curator of the Museum of Philadelphia. Besides his numerous contributions to anthropological and geographical magazines, he published *The Central Aravaks* (1918).

FAR EASTERN REPUBLIC. See SIBERIA AND FAR EASTERN REPUBLIC; RUSSIA; JAPAN.

FARMAN, HENRI (1874-). A French designer of aircraft who was the first man in Europe to accomplish a flight of a mile. He is best known for his inventions based on the Voisin machine from which he evolved the airplane bearing his name. He followed the lines of the Voisin type fairly closely but altered the controls and the design of the undercarriage. He reduced the weight and supporting area. This machine was prominent in the famous London to Manchester flight.

FARM TRACTOR. The tractor is a mechanically propelled prime mover having as its source of self-contained power usually either a steam or internal-combustion engine. The significance of the tractor in agriculture is its utility as a source of tractive energy for field and hauling operations and as a source of belt power for stationary mechanical farm operations. The earlier tractors were large, heavy, and powerful machines actuated by steam engines. They were used almost exclusively for heavy hauling, heavy drawbar work such as the pulling of very large gang plows in the breaking of virgin prairie lands on a large scale, and for heavy farm belt work such as the operation of threshers, usually on custom work. Steam tractors are still used in agriculture occasionally for operations requiring higher power. They are also used, particularly in Europe, for the operation of cable-drawn plowing and cultivating outfits. In this the tractor itself is stationary and actuates a drum and cable which draws the plowing and cultivating apparatus back and forth across the field. Such outfits are especially adapted to swampy or other soil conditions which will not permit the operation of a heavy tractor in direct traction and where cultivation is necessary for the production of crops.

The internal-combustion engine tractor is a more recent development and has now largely supplanted the steam tractor for use in agriculture. There are a large number of types and sizes of internal-combustion engine tractors. In a broad general way this variation corresponds to distinct types of agricultural service. For example, the small garden tractor weighing about 500 pounds rated at 1.25-4 horse power, is adapted only to certain light garden drawbar operations and belt operations requiring a low maximum power. On the other hand, the extremely large tractor weighing 30 000 pounds rated at 70-120 horse power, is adapted only to the heaviest of drawbar and belt operations. A great variety of types and sizes of tractors exists between these two extremes. When it is considered that in 1922 there were over 300 different types and sizes on the market, it would seem that the variation is due much more to lack of standardization than to the variation in the requirements of agricultural processes.

As a rule, the general characteristics of a tractor for agricultural use are governed largely by the number and size of plows it can pull through average soil at an average depth and speed. While tractors are designed and built to run at speeds varying up to five miles or more per hour on actual drawbar work, a plowing speed of about $2\frac{1}{2}$ miles per hour for tractors of 15 drawbar horse power or less is generally considered to be the most efficient speed under average conditions. Small plats usually require only a small garden tractor of 1.25-4 horse power which will pull a 12-inch plow. Truck farming will require a tractor capable of pulling one 14-inch plow. Farms up to 160 acres in size will require a tractor capable of pulling at least two plows, while large farms of 300 acres or more will require a tractor capable of pulling three or more plows. As a very general average, and depending upon the soil, about eight drawbar horse power are required to pull two 12-inch plows, 10 horse power for two 14-inch plows, 15 to 20 horse power for three to five 14-inch plows, 22 to 30 horse power for five or six 14-inch plows, and 30 to 45 horse

power for from six to twelve 14-inch plows. It is to be noted that there is a wide variety of tractors to choose from when from 12 to 20 drawbar horse power are required.

The propulsion requirements in drawbar work govern the characteristics of the driving mechanism and ground-gripping devices of tractors. Tractors divide, broadly, into wheel and crawler or self-tracklaying types. In the wheel type tractor, propulsion results from the action of two large drive wheels equipped with ground-gripping lugs and actuated by means of the engine through the medium of gears, clutches, and shafts. The majority of wheel tractors are steered with ordinary steering gear attached to two wheels independent of the drive wheels, although in some special types steering is done with the drive wheels. The majority of tractors are of the wheel type. Experience has shown that the drawbar requirements of most farms with favorable conditions of soil and topography can be more effectively and economically met with wheel tractors than with crawler tractors, especially where the light or medium weight tractor is required. Considerable experience and care are necessary in the operation of wheel tractors, especially when drawing cultivating machinery, since the sudden and severe resistances occurring in cultivation emphasize the rotating tendency of the tractor around its drive wheel axles and frequently result in accidents and damage.

The crawler or tracklaying tractor is adapted especially for conditions where drawbar work is very heavy or where soil and topographic conditions will not permit the operation of a wheel tractor. Such a tractor consists of an engine and frame mounted on and propelled by a combination of large geared wheels and very broad, heavy endless chains. The power for propulsion is transmitted from the engine to the large gear wheels over which the endless chain passes, laying several links at a time on the ground as the tractor proceeds. These chains are wide and large enough so that the weight of the tractor is distributed over quite a broad area, resulting in a very low pressure on the soil per unit area. This permits the crawler tractor to operate with ease over soil in which a wheel tractor would sink. Since the chain tread extends the entire length of the tractor and on both sides thereof, the frictional contact of the soil-gripping devices is relatively very great and its propulsive energy is at a maximum. The crawler tractor is thus a very powerful unit. In addition, the large area of contact of the treads with the soil permits operation over ditches and land with rough topography. The crawler tractor has been found well adapted to the breaking of virgin swamp and cut-over lands in the United States and to rice land cultivation, especially in India. Owing to its rather limited practical agricultural utility as compared to wheel tractors the crawler is usually a heavy, high-powered unit of relatively high cost.

About the hardest agricultural belt work for which a tractor is adapted is operating the thresher. Such work will require from 10 to 50 horse power, varying with the type of machine and grain, but under most conditions the threshing of wheat and oats will require only from 20 to 30 belt horse power. Other of the larger belt power applications of the tractor are corn husking and shredding, hay baling, ensilage

cutting and blowing, corn shelling and feed grinding, all of which usually require less power than threshing. While there is considerable controversy as to the extent of the actual utility of the tractor in agriculture, obviously it has become a factor of considerable importance in farming operations. Its capability of performing timely field operations quickly and on a large scale was officially recognized by the French, British, and Italian governments in their efforts to increase food production during the War. It was extensively used in the United States for belt and drawbar operations on farms even prior to 1917. As evidence of the continued and increased belief in its utility on farms, especially under conditions where timeliness in the performance of belt and field operations is an important factor, a conservative estimate indicates that there were approximately 325,000 internal-combustion tractors on farms in the United States on Jan. 1, 1923, and approximately 400,000 on Jan. 1, 1924, representing an actual increase of 100,000 and a discard of 25,000 in one year. The conditions and requirements of service for different localities and types of farming are so variable as to make it difficult to estimate the average life of a tractor with any accuracy. An estimate of from five to seven years would probably be sufficiently conservative for the majority of conditions of normal service.

FARRAND, LIVINGSTON (1867-). An American educator. In 1914 he became president of the University of Colorado, and held that position until 1919. During the War he was director in France of the International Health Board, in 1917-18, and from 1919 to 1921 was chairman of the Central Committee of the American Red Cross. In the latter year he was chosen president of Cornell University. He contributed many articles to psychological and anthropological publications.

FARRAND, MAX (1869-). An American university professor (see Vol. VIII). He published *Development of the United States* (1918) and *Fathers of the Constitution* (1921).

FARRAR, GERALDINE (1882-). An American dramatic soprano (see Vol. VIII). At the height of her artistic powers she retired from the operatic stage, appearing for the last time at the Metropolitan Opera House as Zaza, in Leoncavallo's opera, on Apr. 22, 1922. After the fall of the curtain, scenes of wild enthusiasm were enacted inside the house and on the street. For 16 consecutive seasons she had been one of the most popular artists of the company. Since the sensational success of her film production of *Carmen*, in 1915, she has been in-

creasingly active in this field. In 1916 she published an autobiography, *Geraldine Farrar* (Boston).

FARRÈRE, CLAUDE. Pseudonym of CHARLES BARGONE (q.v.)

FARWELL, ARTHUR (1872-). An American composer, born at St. Paul. He studied with Norris in Boston, Humperdinck in Berlin, and Guilmant in Paris. From 1910 to 1913 he was director of municipal concerts in New York City, and from 1915 to 1918, director of the Music School Settlement there. He then moved to Pasadena, where he devoted much time to community music. He was always deeply interested in the music of the American Indians and at various times visited Indian reservations. In 1901 he established at Newton Centre, Mass., the Wa-Wan Press for the publication of American works, especially those based on Indian themes. He was the first recipient of the Composers' Fellowship awarded by the Pasadena Music and Art Association (1921). In his compositions he employs chiefly Indian themes. He published collections of Indian melodies and folk-songs of the South and West and was known as a writer on his subject, particularly through his former associate editorship of *Musical America*.

FASCISM. Fascism (Italian, *fascismo*) denotes an ultranationalistic regenerative movement which played a prominent rôle in the post-bellum development of Italy, 1919-24, and which spread to Spain, Bavaria, and other countries. The central impulse of Fascism was nationalism, an ideal generating in turn the determination to extricate Italy from chaos, to give her moral unity, to make her a new state, and to make it an axiom and a creed with every one that all social progress must be through and by the nation. Fascism came into power with dramatic suddenness, a movement of emotion and action fusing together in the crucible of patriotism the most diverse elements of Italian society: soldiers back from the trenches, business men, peasants, and proletarians. The first groups of Fascists were formed in March, 1919, at the very moment when Italy's nationalist claims to Fiume were being disputed at Paris, while within Italy communist agitators were boldly preaching not only social revolution but also antimilitarism and pacifism. The two-fold aim of the original Fascisti was to suppress communism and exalt patriotism. Taking their name from the Latin *fascēs*, the bundle of rods wrapped round an ax to indicate power to punish offenders, the Fascisti assumed the right to enforce order by using violence against socialists and pacifists. Unlike members of the American Ku Klux Klan, the Fascisti did not conceal their identity; but like the Klan, they appreciated the emotional appeal of uniforms, organization, and sonorously titled officers. Each active member of the Fascist organization wore a black shirt, oftentimes decorated with war medals; for many had fought with distinction in the War. The organization was very elaborate, modeled on the ancient Roman imperial army. Strict discipline bound rank and file to obedience. And at the head of the movement was the forceful Benito Mussolini, a blacksmith's son, once a socialist, and later editor of the patriotic *Popolo d'Italia*.

During the early stages of the movement, two phases of activity were most notable. First and foremost, the Fascisti, as has been said,

were patriots, superpatriots, and they expressed their loyalty to Italy by forcibly suppressing pacifist demonstrations, by conducting propaganda in favor of Italy's most extreme territorial claims, to the Tirol, Istria, Fiume, Dalmatia, Albania, etc.; and by inculcating a spirit of devotion, almost of worship, toward the national state. One very significant manifestation of this nationalist devotion was the scorching criticism which the Fascisti heaped on the "outworn and incapable governments which had become a menace to the development of Italy and under whose rule the authority of the state had fallen into decadence and decay." Fascist writers and speakers, with this phase of their movement in mind, often described Fascism as a "spiritual revolt." Secondly, Fascism was anti-communist. From 1919 to 1922 it waged a sort of guerrilla warfare against socialism in Italy; Fascisti roughly dispersed Socialist party meetings, raided Socialist printing offices and headquarters, and administered novel and ingenious forms of physical punishment to leading Communists. Further, it organized labor unions of its own, found work for the unemployed with Fascist capitalists, and thanks to its success in these directions, soon began to accept the affiliation of unions which deserted socialism. To prevent the landless peasants of southern Italy and Sicily from joining forces with the social revolution, the Fascisti took it on themselves in many localities to cut the Gordian knot of the agrarian problem by compelling landlords to subdivide and sell their estates, or by persuading friendly landowners to offer small plots for sale to peasants. So effective were these measures that communism in Italy was, if not annihilated, at least compelled to work underground, and even the more moderate political socialism was reduced to impotence. By 1921, Fascism, in the words of Mussolini himself, was no longer "liberation but tyranny; no longer the safeguard of the nation, but the upholding of private interests and of the most grovelling and unenlightened classes existing in Italy." Cesare Rossi, one of Mussolini's chief lieutenants, likewise said, "Fascism has become, in truth, an entirely conservative and reactionary movement . . . *It reacts with foolish and purposeless cruelty against everything that tells of progress in the life of to-day. . . . That very character of petty, overbearing tyranny, of which we used to accuse the Socialist party in the days . . . of their supremacy, has now been transferred to the very heart of the Fascist movement.*"

As the organization became more powerful, it entered its political phase. Indeed, now that it embraced workingmen and peasants as well as bourgeois and militarists, it could no longer pursue a clear-cut policy in economic matters, nor could it survive permanently by merely talking about patriotism. Political action was a necessity as well as a logical consummation of the order's career. Gradually the Fascisti gained control of many municipalities, using violence where votes would not avail. Then their leaders looked to Rome. Mussolini grew more insistent in his declarations that the existing parliamentary government, headed by a vacillating coalition cabinet, was unrepresentative and unworthy of Italy. Soon he had the temerity to demand for himself and his followers places in the cabinet. Meeting refusal, he became but more ambitious. In October, 1922,

he compelled the Ministry to resign and installed a Fascist cabinet. See ITALY, *History*.

The Fascisti preserved their organization as a sort of unofficial militia on which Mussolini could, if need be, rely, at the same time they constituted themselves a political party for parliamentary and electioneering purposes. Though he had denounced the inefficiency and unrepresentative character of parliamentary government, Mussolini utilized Parliament to carry out his own policies, and after he had won a sweeping electoral victory, his administration became in form at least a responsible government, like its despised predecessors. One marked difference characterizing Fascist rule, however, was the fact that force was relied on as an expedient to be employed if democracy failed. "I declare," said Mussolini in 1923, "that my desire is to govern, if possible, with the consent of the majority, but in order to obtain, to foster, and to strengthen that consent, I will use all the force at my disposal." All else failing, "there is always force." This was the aspect of Fascism that appealed so strongly to ambitious leaders in Spain, Bavaria, Bulgaria, Mexico, and many another country: if votes fail, there is always violence.

In economic policy since 1922, the Fascists emphasized chiefly the reform of governmental finance. In reducing expenditures, to balance the budget, they performed fiscal miracles. For labor, they enacted an eight-hour day law and a collective agreements law designed to promote collective bargaining between organized labor and organized capital. This was their substitute, in practice, for the state socialism, the syndicalism, or the communism which radical workers had desired. State monopolies, such as telephone service, matches, etc., were handed over to private companies, in accordance with the Fascist principle of maintaining private enterprise and combating state socialism. In religion, the Fascisti, in power, were partisans of reconciliation between Catholic and non-Catholic; they restored compulsory religious instruction: and they endeavored to establish more cordial relations with the Vatican—all for the sake of that national unity which, to their way of thinking, should transcend all else. This brings us, finally, to the patriotic or nationalist aspect. In keeping with its ardent nationalism, Fascism insisted on improvement of military, naval, and, above all, air forces; it revived interest in the colonies; it persistently cherished irredentist hopes for Fiume until in 1924 Mussolini was able to obtain the coveted city; it was ready to burst into hot flames of chauvinist emotion at any slight to national honor. Such a force, as the Corfu incident only too clearly showed, could be a peril to European peace as well as a temptation to aggression. See ITALY.

FATIGUE. See PSYCHOLOGY, ABNORMAL.

FAULHABER, MICHAEL VON (1869-). A bishop of Munich, born at Heidenfeld. He took his degree at the University of Würzburg and spent some years in Rome. He is the author of works of timely import, among them *Petrus Stirbt Nicht* (1903); *Die Vesperpsalmen* (1906); *Schule und Religion* (1907); *Priester und Volk* (1911); *Hirtensbriefe* (1912); *Charakterbilder aus der Biblischen Frauenwelt* (1920); *Die Freiheit der Kirche* (1913); *Waffen des Lichtes* (1918); *Das Schwert der Geister* (1918); *Trennung von Kirche und Staat*

(1919); *Zeitfragen und Zeitaufgaben* (1920); and *Das Papsttum in Unserer Demokratischen Zeit* (1920).

FAULKNER, JOHN ALFRED (1857-). An American church historian (see VOL. VIII). He published *Wesley as Sociologist, Theologian, Churchman* (1918), *Value of Study of Church History* (1920), and *Modernism and the Christian Faith* (1921).

FAY, ALBERT HILL (1871-). An American mining engineer, born in Appleton City, Mo. He graduated from the Missouri School of Mines in 1902 and took post-graduate courses at Columbia. He was in charge of mining operations in Mexico, Alaska and Tennessee until 1908, when he joined the editorial staff of the *Engineering and Mining Journal*. He served with the Bureau of Mines from 1911 to 1920, and from the latter date was valuation engineer with the Internal Revenue Bureau. From 1921 he was also head of the natural resources division of that bureau. He wrote *Coal Mine Fatalities in the United States, 1870 to 1916* (1916); *Glossary of the Mining and Mineral Industry* (1920). He also wrote numerous technical bulletins.

FAY, HENRY (1868-). An American chemist, born in Williamsport, Pa. He graduated from Lafayette College in 1889 and took post-graduate courses at Johns Hopkins. He was instructor at that university from 1893 to 1895, and from the latter date to 1920 was a member of the faculty of the Massachusetts Institute of Technology, becoming professor of analytical chemistry and metallography in 1920. He was also consulting chemist for several large corporations and was lecturer at the United States Military Academy and the United States Naval Academy. He wrote *Microscopic Examination of Steel*, 1917, and contributed articles on chemistry and metallography to various journals.

FAYANT, FRANK H. (1876-). An American publicist, born at Fort Plain, N. Y., and educated at Cornell University. He worked on various newspapers from 1895 to 1900, acting as war correspondent for the *New York Sun* in the West Indies from 1898 to 1900. In the latter year he was London correspondent for the *New York Herald* and served other American magazines and journals until 1911, when he became a member of the editorial staff of the banking and currency reform campaign. He served during the World War in various important capacities and is author of *Fools and Their Money* (1907), *Government and the Railroads* (1919), *To Increase Railroad Efficiency* (1922), and other works.

FAYOLLE, MARIE EMILE (1852-). A French soldier. He was educated at the Superior School of War and for several years served as instructor at that institution. In 1903 he was promoted lieutenant-colonel and became general in 1910. In 1914 he commanded the artillery brigade of Vincennes, and in the same year was made commander of the 70th Division of Infantry. In the year following he was made commander of the 33d Army Corps, and later of the 6th French Army. He was given command of the French forces in Italy in December, 1917. He greatly distinguished himself in the first French offensive in Lorraine, in 1914, by energetic action which held up the German advance. He also performed important service in the battles of Arras. His name is chiefly connected,

however, with the battle of Somme, in 1915. Here he commanded the 4th French Army. In 1918 he was given command of a group of armies which included a part of the American Expeditionary Force. His efforts in withstanding the movements of the Germans at Amiens in 1918 were especially effective. In 1920 he visited the United States as a representative of General Foch at the convention of the American Legion.

FAZY, HENRI (1842-1920). A Swiss Radical statesman and historian, born at Berne. He studied philosophy and law at Geneva; in 1860, he became a member of the cantonal parliament, and in 1897, a member for the remainder of his life of the cantonal executive. Like his great-uncle, James Fazy, he played a prominent part in Radical politics at Geneva. His proposal to separate the Church and State was not accepted by the Swiss until 1907. He was a member of the Swiss National Council (1896-99, 1902-20), archivist of Geneva, and professor of Swiss history at the University of Geneva (1896-99, 1902-20). Although the Radicals were completely defeated in the election of 1918, he still held his office. His *Life of James Fazy* appeared in 1890, works on the Swiss Government shortly afterward, *Histoire de Genève à l'Epoque de l'Escalade, 1589-1601* (1902), and *Genève et Charles Emmanuel* (1909).

FECHTER, PAUL (1880-). A German editor and art critic. He has been literary and dramatic editor of the *Dresdener Neueste Nachrichten*, the *Fossische Zeitung*, and other prominent papers, and is the author of *Der Expressionismus* (1914), *Frank Wedekind* (1920), *Das Graphische Werk Max Pechsteins* (1920), *Die Tragödie der Architektur* (1921), and other works.

FEDERAL AID ROAD ACT. See **ROADS AND PAVEMENTS**

FEDERAL COUNCIL OF THE CHURCHES OF CHRIST IN AMERICA.

Founded in 1908 by the official action of 30 Protestant denominations in the United States to represent them and act for them in matters of common interest. No control was exercised over the churches; rather it was their own agency for coöperation and common expression, directed and controlled by their representatives. Four hundred members elected by the denominational assemblies compose the quadrennial Council, which met in 1916 and 1920 and was scheduled to meet in December, 1924. The executive committee met annually; the administrative committee, monthly.

The activities of the Council during the years between 1914 and 1924 were varied and were carried on through numerous commissions. The commission on international justice and goodwill was especially active. It rendered effective service in European relief movements and for several years was of assistance to the Near East Relief. A committee on mercy and relief was appointed, through which, in the summer of 1922, a representative of the Council was sent to Russia to distribute relief, especially to the destitute among the clergy of the Russian church and their dependents; in 1924 it carried on a church campaign for the relief of German children. Through its committee on relations with the Orient a representative of the missionaries of Japan toured the United States in 1924 in the interest of good feeling between this country and the eastern races; in return a Christian embassy was sent to Japan

the following year. This Committee made investigations on the Pacific coast of the Japanese problem in the United States and in 1919 started a movement to urge Congress to introduce an amendment to the Constitution admitting to citizenship in the United States Chinese and Japanese already in this country, but at the same time in no way affecting the Chinese Exclusion Act and other immigration laws. In 1922-23 a special commissioner was in the Orient in the interest of furthering a better understanding between the eastern and western worlds.

The commission on international justice and goodwill also, when the Disarmament Conference was assembled at Washington, worked through the churches to influence public opinion in favor of its proposals. On the successful completion of the treaties on disarmament it continued its activities unabated to secure the participation of the United States in permanent organized cooperation for world peace and human welfare. During 1924 it concentrated attention on the entrance of the United States into the Permanent Court of International Justice.

In May, 1917, the Federal Council held a special meeting to consider the problems of the churches arising from the entrance of the United States into the War. There was organized, to coordinate the work of the denominations in behalf of the soldiers and sailors, the general war-time commission of the churches. It also worked with the various relief agencies in Europe. On its dissolution in 1919 it appointed a committee on the War and the religious outlook, made up of a few representatives of the larger churches, to study the state of religion as revealed or affected by the War. It issued several volumes setting forth the results of its findings, including *The Church and Industrial Reconstruction and Christian Unity: Its Principles and Possibilities*.

Other commissions took up the relief and reconstruction work of the Council in Europe after the close of the War, assisted the churches in the devastated countries, and were active in initiating and preparing the way for a universal conference of the Church of Christ on life and work, to be held in 1925 for the purpose of considering how the churches of the world can bring about a fuller application of the Christian gospel to modern life.

The commission on the church and social service was actively engaged in efforts to improve industrial relations and promote the intelligent cooperation of the churches in community service and in support of such social movements as prison reform and the abolition of child labor. Many of the contacts for this work were formed during the War when the commission cooperated with the Red Cross in army and navy centres, industrial centres, and Negro communities.

The department of research and education devoted itself chiefly to bringing together and interpreting social data made available by various research organizations in so far as they bore on the work of organized religion. Certain original studies were made, as in the case of industrial disputes where the human factors were an important element in the situation. The department issued a weekly information service and occasional bulletins on particular subjects; for example, wages, hours of

work etc. It maintained, jointly with the National Catholic Welfare Council and the Central Conference of American Rabbis, a conference on economic factors in international relations which in 1924 was preparing educational material for the churches on the economic basis underlying hostile relations between governments.

In 1918 the Council introduced carefully prepared lessons in international peace into the Sunday schools and also took up the matter of religious instruction in cooperation with the public schools. It developed cooperation between the various denominational commissions on evangelism, making available for all those methods which each had found most successful: carried on temperance education, through prohibition pamphlets and motion pictures; and made a survey of religious conditions in rural communities throughout Ohio.

The committee on the church and race relations was organized in 1921 to bring about fuller cooperation between whites and Negroes. There were also permanent committees on army and navy chaplains, on religious work in the Canal Zone, on the interchange of preachers and speakers between the churches of America, Great Britain and France, and an editorial council of the religious press. The publicity department issued the bi-monthly *Federal Council Bulletin*. The presidents of the Council during the period were Dean Shailer Mathews, 1912-16; the Rev. Frank Mason North, 1916-20; and Dr. Robert E. Speer, 1920-24.

FEDERAL FARM LOAN ACT. See AGRICULTURAL CREDIT.

FEDERAL HORTICULTURAL BOARD. See HORTICULTURE.

FEDERAL LAND BANKS. See AGRICULTURAL CREDIT.

FEDERAL POWER COMMISSION. See WATER POWER.

FEDERAL RESERVE BANKING SYSTEM. See FINANCE AND BANKING; AGRICULTURAL CREDIT; UNITED STATES, *History*.

FEDERAL TERRITORY. A territory of the Australian commonwealth lying within the state of New South Wales. Area, 940 square miles; population in 1911, 1714; in 1922, 2592. The site for a Federal capital and a port was acquired from New South Wales in 1909 and work was begun in 1913 on the construction of the commonwealth's capital city. An additional area of 28 miles at Jervis Bay was added for the purpose of establishing a naval college. Progress on the work was seriously retarded during the War. By 1922, upwards of \$5,000,000 had been spent.

FEDERAL TRADE COMMISSION. See TRUSTS.

FEDERAL WATER POWER ACT. See WATER POWER.

FÉDÉRATION INTERNATIONALE DES ANCIENS COMBATTANTS. See LEGION, AMERICAN.

FEDERATION OF LABOR, AMERICAN. See LABOR, AMERICAN FEDERATION OF.

FEDERN, KARL (1868-). An Austrian critic, translator, and authority on Dante. He was born in Vienna. He studied law at the University of Vienna and practiced it before he turned to literature. He traveled in Italy, England, and France and has written on a great variety of subjects. His earliest works, including *Gedichte* (1893) and *König Philipps Frau-*

en (1894) were poetical, but he soon abandoned verse for prose. His book on the *Vita Nuova*, *Das Neue Leben des Dante Alighieri* (1897), was the forerunner of his *Dante*, a biography (1900), which has been translated into other languages. Two noteworthy books of essays are *Essays zur Amerikanischen Litteratur* (1899) and *Essays zur Vergleichenden Litteraturgeschichte* (1904). Other works are *Frauenrecht und Logik* (1904) and the book in which he branded the attitude of Italian judges toward women, *Der Prozes Bonmartini-Iurri* (1906), translated into Italian and French. He also wrote some fiction, *Zwei Norellen* (1899), *Rosa Maria* (1901), and *Die Flamme des Lebens* (1906), and edited a collection of the world's fiction, *Hundert Novellen* (1912-13). As a student of seventeenth-century France he wrote *Der Chevalier Grammont* (1910) and *Schriften und Briefe des Herrn St. Evremont* (1912). To the literature of the War he contributed *Die Politik der Dreiverbündeten* (1915). He has translated Emerson, Edward Carpenter, Mesnil, Whitman, Croce, and others.

FELAND, LOGAN (1869-). An American soldier, born in Hopkinsville, Ky. He graduated from the Massachusetts Institute of Technology in 1892. He served in the Spanish-American War and in 1899 was appointed first lieutenant in the Marine Corps. He was promoted to be major in 1916, colonel in 1918, and brigadier-general in 1920. He served in the Philippines, Panama, Cuba and Santo Domingo. He was commander of the 5th Regiment of Marines in 1918 and the 2d Brigade of Marines in Santo Domingo in 1919-20. For distinguished service in France, he was three times awarded the Croix de Guerre with Palm, and was made an Officer of the Legion of Honor. He also received the Army D. S. M. and the Navy D. S. M. for distinguished service.

FELDEN, EMIL J. (1874-). A German clergyman and author, born at Montigny (near Metz), and educated at the Gymnasium and the University of Strassburg. After serving as vicar and then pastor in various places, he was finally made primate of St. Martini, Bremen, in 1907. In 1904 he was editor of the *Elbsächsische Tageblatt* of Colmar. He became a member of the Bremen *Burgerschaft* in 1920. Besides articles on religion and ethics in newspapers and periodicals, he is the author of numerous works, among them *Im Gebirgsdorf*, a novel (1899); *Die Protestantische Kirche in Deutschland* (1902); *Kirchlicher Liberalismus und Radikalismus* (1908); *Königskinder* (1914); *Kind und Gottesglaube* (1915); *Grundriss eines Freien Religionsunterricht* (1916); *Menschen von Morgen* (1918); *Im Kampf um Frieden* (1919); *Die Sünde des Vatikans* (1920); *Spiritismus und Andere Okkulten Systeme* (1920); *Sieghafte Menschen* (1920), and *Die Sünde wider das Volk* (1921). He became the editor of the periodical *Es Werde Licht* in 1920.

FELLOWSHIPS. See UNIVERSITIES AND COLLEGES.

FELTON, LLOYD DERR (1885-). An American physician who, having received the degree of M.D. from Johns Hopkins, became attached to the Laboratory of Bacteriology and Immunology there. He resigned to accept a similar position at Harvard. In 1924, after researches pursued under the auspices of the Metropolitan Life Insurance Company, he an-

nounced the discovery of an antipneumonic serum which had already shown the ability to reduce greatly the mortality of that disease and had received the approbation of prominent health officers. Dr. Felton has recently been appointed assistant professor of hygiene and preventive medicine at Harvard.

FELTON, SAMUEL MORSE (1853-). An American railway official (see VOL. VIII). He was appointed director-general of military railroads by the Secretary of War in 1917 and was chairman of the port and harbor facilities commission of the United States Shipping Board in 1918-19 and was acting chairman of the board in 1919. He was president of the Western Railway Association and a member of several engineering and patriotic societies. He was awarded the Distinguished Service Medal for his war-time services and was also awarded the Cross of the Legion of Honor by the French government.

FEMINISM. See WOMAN SUFFRAGE; WOMEN IN INDUSTRY; PAINTING, France; AND SCULPTURE, United States.

FENCING. See SPORTS.

FENOLLOSA, MARY MCNEILL ("SIDNEY McCALL"). An American author, born at Mobile, Ala., and educated at Irving Academy in that city. She is the author of entertaining stories, some of them dealing with Japan, where she lived for some years. Her works include *A Flight of Verses* (1899), *The Dragon Painter* (1906), *The Breath of the Gods* (1906, 1920), *Blossoms from a Japanese Garden* (1915), *Sunshine Beggars* (1916), *The Stirrup Latch* (1917), *Christopher Lawd* (1919), and others. She edited her husband's *Epochs of Chinese and Japanese Art*.

FERBER, EDNA (1887-). An American novelist and short story writer, born at Kalamazoo, Mich. After studying at the Appleton (Wis.) High School, she became a reporter on the Appleton *Daily Crescent*, and was later employed on the Milwaukee *Journal* and Chicago *Tribune*. Miss Ferber's writings are characterized by understanding and alertness of thought. She has published *Dawn O'Hara* (1911), *Buttered Side Down* (1912), *Roast Beef Medium* (1913), *Personality Plus* (1914), *Emma McChesney & Co.* (1915), *Fanny Herself* (1917), *Cheerful by Request* (1918), *Half Portions* (1919), *The Girls* (1921); the comedy, *Our Mrs. McChesney*, in collaboration with George V. Hobart; *Gigolo* (1922), and *So Big* (1924).

FERDINAND I, KING OF BULGARIA (1861-). (See VOL. VIII.) In 1918 he abdicated in favor of his son Boris and retired to Coburg.

FERGUSON, ELSIE (1885-). An American actress, born in New York. She made her first appearance at the Madison Square Theatre in *Liberty Belles*. She starred in *The Outcast*, *Margaret Schiller*, and *Shirley Kaye*. In 1917 she went into motion pictures in *Barbary Sheep* and later did excellent work in *Rose of the World*, *The Avalanche*, *The Witness for the Defense*, *Footlights*, and *Peter Ibbetson*. She returned to the speaking stage in 1920 in *Sacred and Profane Love* and appeared in *The Varying Shore* (1921).

FERGUSON, FRANK WILLIAM (1861-1926). An American architect, born at Portsmouth, N. H., and educated at Dartmouth College. As a member of the firm of Cram and Ferguson he

helped plan buildings at the United States Military Academy at West Point, Saint Thomas's Church in New York City, Princeton University, Richmond College, Williams College, and Rice Institute at Houston, Tex.

FERGUSON, JOHN CALVIN (1866-). An American in the service of the Chinese government (see Vol. VIII). He was counselor in the Chinese Department of State in 1915-17 and became adviser to the President of the Republic of China in 1917. He was a delegate to the Disarmament Conference (1921).

FERNALD, ROBERT HEYWOOD (1871-). An American engineer, born at Orono, Me. He studied at the Maine State College and at the Massachusetts Institute of Technology, Case School of Applied Science, and Columbia University. For several years he was a member of the faculty of the Case School, and from 1902 to 1907 was professor of mechanical engineering at Washington University. From 1907 to 1912 he was professor of mechanical engineering at the Case School, and from 1912 to 1921 was Whitney professor of dynamical engineering at the University of Pennsylvania. From the latter date he was director of the Department of Mechanical Engineering at that university. He was a member of many engineering societies and was the author of many reports and bulletins relating to the conservation of the fuel resources of the United States.

FERNOW, BERNHARD EDUARD (1851-1923). An American forester and educator (See Vol. VIII). From 1907 to 1919 he was dean of the faculty of forestry at the University of Toronto and in the latter year was retired as professor emeritus.

FERRAN Y CRUA, JAIME (1852-1919). A Spanish bacteriologist and sanitarian, contemporary of Koch and said by his fellows to have made some of the latter's discoveries independently and to have anticipated many important developments in the prevention of epidemic diseases. As early as 1885 he wrote on immunization against cholera. In 1893 his work on this subject was translated into French with the title *L'Inoculation préventive contre le Cholera*. Recently (1921) Fernandez, a Spaniard, published a considerable volume, with a Latin title, *Woe to Great Inventors*, seeking to show that Ferran had anticipated the methods of immunization practiced successfully in the War by 30 years. Another subject in which Ferran was always deeply interested is tuberculosis and the possibility of immunization against it. Some of his ideas on the transmission and virulence of this disease are revolutionary.

FERRI, ENRICO (1856-). An Italian criminologist (see Vol. VIII). After 1914 he published *Il Diritto Staccionata* (1916); *L'Azione di Risarcimento dei Danni dell'Imputato Assolto contro il Denunziante* (1916); *Enrico Pessina ed il Pensiero Italiano sulla Giustizia Penale* *Discorso Commemorativo* (1917), and *Commissione Reale per la Reforma della Leggi Penali* (French, English, German translations; 1921). His *Criminal Sociology* appeared in a new English translation in 1917. He is the subject of one of the chapters in Giovanni Papini's *Ventiquattro Cervelli; Saggi non Critici* (1918).

FERRIS, DAVID LINCOLN (1864-). An American bishop, born at Peekskill, N. Y., and educated at the Peekskill Military Academy,

the Cayuga Lake Military Academy, Hobart College (Geneva, N. Y.), and the Berkeley Divinity School (Middletown, Conn.). He was ordained priest in the Protestant Episcopal Church in 1894, having become deacon in the year preceding. He held several pastorates from 1893 to 1920, becoming in the latter year suffragan bishop of the diocese of Western New York. He served on various religious boards and committees and was made a trustee of Hobart College.

FERRIS, WOODBRIDGE NATHAN (1853-). An American educator and public official (see Vol. VIII). He was governor of Michigan, 1913-14 and 1915-16, and was elected United States Senator for 1923-29.

FERTILIZERS. The term fertilizer as used in this article includes not only commercial fertilizers, but also farm manures and other substances added to the soil to increase its productivity. It therefore includes materials which not only furnish plant food but perform other functions in correcting soil deficiencies and promoting plant growth. During and immediately following the War, the price of commercial fertilizers was prohibitively high, with the result that the use of fertilizers was seriously curtailed to the detriment of the manufacturer and the farmer. The effect of the War upon the production and price of fertilizers is strikingly indicated by the fact that there were produced in the United States in 1921, 5,994,179 tons (of 2000 lb. each) of fertilizers valued at \$174,878,864, as compared with 8,432,206 tons valued at \$153,260,212 in 1914. Fertilizer prices reached their peak in 1919. Recognizing the need for cheaper fertilizers, the Tariff Act of 1922 exempted from duty all materials used chiefly for fertilizing, as well as sulphuric acid, an essential in the fertilizer industry. Prices in 1924 were about 1913 levels plus the increased cost of labor and freight. It is estimated that freight alone on raw materials and finished product represents 25 to 30 per cent of the average cost of fertilizers to farmers. This emphasizes especially the importance of high grade concentrated fertilizers and fully justifies the recent effort which is being made to reduce the number of fertilizer formulas and to encourage the use of only high grade mixtures.

The experience of the ten years 1914-24 demonstrated strikingly the precarious nature of the world's supply of raw materials for fertilizers in times of disturbed commerce, particularly that of nitrogen. Nitrogen for fertilizer purposes is largely drawn from the nitrate deposits of Chile, but these are steadily declining in quantity and quality and increasing in cost of mining and delivery to consumers. Moreover, this source of supply may be cut off entirely in times of war or other disturbed conditions. The production of sulphate of ammonia as a by-product of coke ovens cannot be expected to meet the world's needs, and organic sources of nitrogen, such as cottonseed meal, slaughterhouse products, and the like, are being more profitably utilized for other purposes. Fertilizer nitrogen must therefore come in increasing proportion from other sources. Fixation of the nitrogen of the air by electrical processes offers an inexhaustible supply. The world's production of fixed nitrogen increased from about 1 to 35 or 40 per cent of the total production of nitrogen fertilizer between

1914 and 1924. In 1910 Germany imported 65 per cent of the nitrogen compounds she used. In 1924, largely because of development of fixation processes, she was practically independent in this respect. A considerable fixed nitrogen industry also was developed in Norway, but practically nothing had been achieved in this direction in the United States up to 1924, although, with an appropriation of \$20,000,000 carried in the National Defense Act, construction was begun in 1916 at Muscle Shoals, Ala., of a plant estimated to have a capacity of 40,000 tons of fixed nitrogen per year. This plant had not been completed and operated, and President Coolidge recommended to Congress that it be sold, subject to recall in time of war and with a proviso requiring further investigation with the object of cheapening the cost of the fertilizer produced. Various offers and proposals were under consideration by Congress (See MUSCLE SHOALS.) A Fixed Nitrogen Laboratory was established in 1919 by the Secretary of War, under the National Defense Act, to aid in developing the industry and especially for perfecting methods. This laboratory, transferred to the Department of Agriculture in 1921, reported the discovery of a catalyst which it was believed would increase the efficiency and reduce the cost of the fixation process. The various products of the fixation processes, including cyanamide, nitrates, urea, with the possible exception of cyanamide, have shown fertilizing effects comparable with those of nitrate of soda and sulphate of ammonia, although some of them are difficult to use because of their hygroscopic nature. Urea has, however, proved to be an effective nitrogen carrier on all types of soils tested.

Phosphoric acid is almost universally needed by the soils of the United States, but fortunately the natural supply of phosphates is abundant (estimated at over 10,500,000,000 tons), as are the materials necessary for converting it into available form. The production of acid phosphate, the form in which phosphate is most commonly used as a fertilizer, was 3,367,220 tons (of 2000 pounds each) in the United States in 1923. The preparation of acid phosphate by the usual method of treatment with sulphuric acid requires a high grade of rock phosphate and results in great waste of the lower grades. Effort therefore has been made to find a process which will utilize the low grade phosphates. The Bureau of Soils of the United States Department of Agriculture has developed such a process. This consists of smelting rock phosphate with silica and carbon and condensing and collecting the volatilized phosphoric anhydride which is used in the preparation of highly concentrated fertilizer compounds. Reduction of rock phosphate by means of sulphur undergoing bacterial oxidation, as proposed by Lipman, was one of the newer developments and appeared to have practical possibilities.

The necessities of the War led to strenuous efforts to develop a potash industry in this country, utilizing for this purpose especially certain western dry lake deposits, kelp, alunite, and dust of cement works, and blast furnaces; but while the industry prospered with war-time prices and fostering, it did not grow to any great proportions, the annual output never exceeding 50,000 tons. and it practically disappeared when prices fell and the German potash

salts were again available. Hope of developing a domestic potash industry has, however, been revived by results of recent studies by the United States Geological Survey, confirming earlier indications of the occurrence of extensive and commercially workable deposits of potash in the Permian salt beds of western Texas and eastern New Mexico similar to those of Stassfurt and Alsace. The scarcity and high price of potash fertilizers during and immediately following the War resulted in a great reduction in the use of such fertilizers, and while this proved to be a distinct disadvantage in some cases, it also indicated other conditions under which potash fertilizers may not give a profitable return.

The growing relative scarcity of manure has led to efforts to find an efficient substitute for it. The Rothamsted Experimental Station reported a fair degree of success with an artificial manure consisting of a fermented mixture of straw, chalk, and ammonium sulphate. Attention has also been turned anew to the possibility of greater use of peat and city refuse, to better methods of preserving manure and to sterilization as a means of prolonging the efficient use of manure in greenhouse culture and market gardening, but the most hopeful advance in meeting this situation has probably been made in the direction of showing the large extent to which commercial fertilizers may replace manure.

The need for liming is widespread and is often increased by the use of commercial fertilizers, as is especially evident in the case of continued use of sulphate of ammonia. Lime corrects acidity, creates favorable bacteriological conditions in the soil, and sometimes supplies needed plant food. It appears also to be an efficient means of controlling certain plant diseases, as, for example, finger-and-toe disease of cabbage, turnips, and similar plants; but it increases scab in potatoes. The different forms of lime, oxide, carbonate, and hydrate, appear to be about equally effective if equally fine and used in amounts supplying the same amount of lime (CaO). See also PHOSPHATE ROCK.

Bibliography. S. B. Haskell, *Farm Fertility* (New York and London, 1923); E. J. Russell, *Manuring for Higher Crop Production*, 2d ed. (Cambridge, England, 1917); A. C. FÉVRIER, HENRI (1875-). A French dramatic composer, born in Paris. He received his musical education at the Conservatoire under Pugno, Leroux, Fauré and Massenet. His reputation rests on the success of a single work, *Monna Vanna* (Paris, 1909; Boston, 1913).

In 1919 he visited the United States for the purpose of witnessing the world première of his *Gismonda* by the Chicago Opera Company. Besides these operas he wrote *Le Roi Aveugle* (Paris, 1906) and the operettas *Agnès, dame galante* (1912), *La Princesse et le porcher* (1912), and *Carmosine* (1914), all produced in Paris.

FEWKES, JESSE WALTER (1850-). An American anthropologist (see Vol. VIII). He has contributed largely to anthropological and other magazines and was appointed chief of the Bureau of American Ethnology in 1918.

FICKE, ARTHUR DAVIDSON (1883-). An American author, born at Davenport, Iowa, and educated at Harvard and the College of Law of the University of Iowa. He taught English at the latter institution and was admitted to the bar in 1908. Among his recent works are *Sonnets of a Portrait Painter* (1914), *The Man on the Hilltop* (1915), *Chats on Japanese Prints* (1915), *An April Elegy* (1917), and *Spectra*, with Witter Bynner (1917).

FICTION. See LITERATURE, ENGLISH AND AMERICAN

FIELD, HAMILTON EASTER (1873-1922). An American artist, born at Brooklyn, N. Y. He studied at the Polytechnic Institute, at Columbia and Harvard Universities and under Raphael Collin and Fantin-Latour at the Ecole des Beaux Arts in Paris. Shortly before his death he inaugurated the Salons of America, of which he was the first president. He was editor of *Arts and Decoration*, editor and owner of *The Arts*, the *Touchstone Magazine*, and *The American Art Student*. He was director of the Thurnscoe School of Modern Art, Ogunquit, Me., and the Ardsley School of Modern Art, Brooklyn. He was also connected with the Ardsley Studio in Brooklyn and at one time was art editor of the *Brooklyn Eagle*.

FIELD, HERBERT HAVILAND (1868-1921). An American zoologist, born in Brooklyn, N. Y., and educated at Harvard. His published papers at Harvard were mostly on the embryology of the frog, but from 1895 he lived in Zurich (Switzerland), where he organized and administered the *Concilium Bibliographicum*, an international catalogue of scientific literature, which aims to give in card-catalogue form the title of every paper on zoölogy published throughout the world.

FIELD ARTILLERY. See ARTILLERY.

FIELDS, JOHN CHARLES (1863-). A Canadian mathematician (see Vol. VIII). He became a member of the University of Toronto Senate in 1914 and was president of the Royal Canadian Institute from 1919 to 1922. Largely due to his efforts was the success of the meeting of the American Association for the Advancement of Science at Toronto in 1921. He had much to do with the organizing work in connection with the International Mathematical Congress which met in Toronto in 1924.

FINANCE AND BANKING. The subject of public finance, customarily restricted to include discussion of revenue and expenditure, may also be taken to cover the discussion of public debt; and in recent years has frequently

been employed to include within its scope discussion of banking and credit as well. The term finance is here used in the latter broad sense. Finance in its public aspect includes two distinct fields of thought: the first covering the theory of taxation and of public revenue in general, as well as the theory and practice of budgetary management on the part of modern nations, the latter including survey of actual results attained as to revenue and expenditure by principal nations. In banking, discussion is usually divided into two more or less distinct fields, the former dealing with the theory and organization of banking institutions, the latter with actual banking systems and results of operation.

Prior to the War, steady and consistent effort was made by nations to maintain a distinct line of separation between public finance and banking, the principal connection between the two types of activity being afforded by the operation of central banks in the different countries. During the War, public revenues were in no small degree obtained through banking methods, with corresponding effects upon prices, while governments practically took possession of banking systems with a view to controlling supplies of credit, issues of currency and rates of interest. The result has been that, since the close of the War, a very intimate connection has continued to exist between public finance and banking in actual practice, while levels of prices and other aspects of the general economic situation have felt the effects of financial and banking policies compositely, rather than independently. Therefore, much discussion of public finance and of banking is to-day carried on jointly, while the bulk of the consideration of public finance implies specified conditions as to banking; and, conversely, statements of theory and practice in banking are based upon specified assumptions as to financial conditions.

Relation of Finance and Banking. Banking is the phase of economic organization, or the economic institution, by means of which the credit function is exercised and through which actual wealth is made available as a means of exchange. Public finance is the science or method whereby governments obtain the resources they need, and apply them to designated objects. Evidently where governments become large operators of industry, large owners of wealth, or large consumers, they come to occupy a very important relationship to banking, inasmuch as they require extensive banking services and must rely largely on banks for the collection and payment of funds as well as for the transfer of wealth from individuals to the government and vice versa, and for the advancement of private resources for government use pending the time when the government has collected from taxpayers wealth in sufficient quantity to meet its requirements. Moreover, the increasing use of paper currency and the hazards involved in leaving its issue unrestrictedly in the hands of the banks have led to the establishment of an intimate relationship between the government and the banking mechanism with respect to the control of the circulating medium. At the same time, the creation and retirement of such medium, coupled with the variations in the volume of bank credit in other forms, have exerted a direct influence on prices, and hence on the volume of taxation required to furnish means for the government's

needs as respects the purchase of commodities and services.

Trend of Finance 1914-24. The war and post-war period included in the decade 1914-24 is too recent to permit of a very positive judgment with respect to the general trend of methods or currents in public finance. It will require a much longer lapse of time to reach definite conclusions as to the probable outcome of the factors which had been set at work as a result of the War; yet there are outstanding facts which are deserving of special notice from a descriptive standpoint and which supply the basis for inferences with regard to the probable trend to be followed in the future. Generally speaking, the outstanding feature of the decade is found in the enormous growth of public expenditure which has carried the outlays of substantially all modern governments, whether belligerent or neutral, up to figures that before the

This showing is clearly paralleled in the fact that Great Britain, whose conditions are perhaps closer to those of the United States than are those of any other country, has seen her national expenditure rise from £2.31 per capita in 1890 to £3.52 in 1900, followed by a very moderate decline to £3.50 in 1910 and an increase to £22.7 in 1921.

Expenditure of Principal Countries. It is worth while to take careful account also of the expenditure of the principal Continental countries, not only because of the inferences that may be drawn from such comparisons as to the causes of growth of public outlay in the different countries but also because of the light that is thereby thrown upon the burdens to which the public of the several nations have been subjected. The accompanying table furnishes the data necessary for such a comparison during the war and post-war period.

Countries	NATIONAL EXPENDITURE

War would have been considered purely imaginative. This enormous growth of public expenditure was, in the belligerent countries, the natural result of warfare and its cost, but in the neutral countries was only partly brought about as the indirect result of these factors. Many of the smaller countries, especially those bordering on the scene of action, found it necessary to mobilize their armies and to keep large bodies of men ready for defense should such a step become necessary. Yet this alone was not a sufficient influence to bring about the tremendous growth of outlay. Added to it was the fact that the enormous inflation of credit and currency in the belligerent countries was reflected in the neutral states, while the world demand for commodities itself tended to raise prices everywhere; the outcome being a great advance in the price level, of which the net result was to necessitate corresponding increases in the amounts of revenue raised for the public service as expressed in terms of money. This state of things, it should be remembered, came into existence at a time when there was already a general drift towards higher levels of expense, which had already made itself apparent not only with respect to absolute amounts but also in proportion to population. The movement, viewed in the aggregate, may be illustrated by the experience of the United States, which was at first a neutral and later a belligerent, its federal expenditure both absolutely and per capita moving as follows:

Year	AMERICAN FEDERAL PUBLIC EXPENDITURE	
	Total (000,000 omitted)	Per Capita
1900	\$520.8	\$6.39
1910	693.6	7.30
1915	760.5	7.26
1920	6,141.7	57.72
1923	3,294.7	29.77

Classification of Expenditure. Almost as important as the gross amount of expenditure, is its classification as between different purposes. Before the War there was everywhere a substantial growth toward an undue outlay for military and naval expenditure, which gave rise to much of the demand for a means of obtaining international agreements for the maintenance of peace. The drift of public expenditures during and after the War greatly exaggerated this tendency toward the growth of military outlay, while at the same time it naturally enlarged the proportion of expenditure going to public debt, due to the fact that the War was necessarily (as will be seen later) so extensively financed upon a borrowing basis. While some progress was made after the close of the War in diminishing the amounts directly spent for army and navy, it was still true in 1924, if the public debt be primarily regarded as a legacy of post-war outlays, that the total amount payable for military and naval reasons far exceeded any other category and was probably on the increase. The table on page 453 reviews the development of American Federal government outlays at intervals from 1870 down to the situation during the fiscal year ending in 1923. Whether expenditure has proceeded more rapidly than the growth of wealth in recent decades is another point as to which statistics are very much less positive. It would seem in the main that prior to the War wealth was increasing slightly faster than expenditures. War experience makes the question far more debatable.

Comparative Revenues. While there is much advantage to be derived from careful comparison of the revenues of different countries, the same difficulty inheres in any such comparison that has been noted in connection with expendi-

Year	EXPENDITURE IN MILLIONS OF DOLLARS						Interest on the Public Debt	Total

tures. Nevertheless, it is possible to afford a rough general comparison of outlays, particularly for recent years, war necessities and negotiations having compelled a closer basis of analysis for the purpose of reducing national expenditures and receipts to somewhat the same footing in one country as in others. The figures in the accompanying table furnish comparative data designed to contrast revenue and expenditure conditions in the several countries over the past decade.

Local Versus National Finance. In the United States, particularly, great interest has always attached to the distribution of taxation and expenditure between the Federal and local governments. This is due to the fact that under our peculiar system of State and local government there has been considerable jealousy between the different grades of administration, as well as more or less conflict in their taxing policy. The War and the developments after it materially affected this relative situation while they widely altered the relationship existing between the amount of Federal and local expenditure and income. In 1904, the Census Bureau, in a first report on the subject, showed that local expenditures were 61.8 per cent of all governmental outlays in the United States. Similar inquiries in Great Britain showed local

United States have been studied by the Census Bureau, which furnishes the following figures:

	1902	1912	1922
(000 omitted)			
States and territories	\$189,165	\$306,521	\$367,470

expenditures for 1910 as 55 per cent. While the increase of local expenditure not only here but in England and in other countries has gone on rapidly measured in absolute figures, being augmented by special causes which are perhaps not permanent in their nature, the relative proportion of local outlay has been reduced, due to the fact that national or Federal expenditures have been so vastly enlarged. For 1920-21, Great Britain's local expenditures were only 18 per cent of her national total while those of the non-Federal grades of government in the United States, in 1922, were 56 per cent of the total.

Local Revenues. Local revenues in the

developed states; (2) Charges.—By this term is meant the sums exacted for the particular services, largely industrial, rendered by the state, including post office, telegraph, telephone, railroad, gas and electric light and sale of manufactured products; (3) Fees.—By this term is meant the sums exacted for services rendered by public authorities in the course of administration of business. Included are court fees, licenses and the like. They are charged upon the theory that they represent the return for a special service which is not enjoyed by the entire body of the community. Special assessments are grouped under the head of fees by

most writers; (4) Taxes.—By taxes are meant sums levied upon the citizen as a contribution to the general welfare or for the support for the government in the performance of functions which are so broadly applicable to all citizens that they cannot be apportioned or assigned, while their cost is so great that they must be paid for on a common basis regardless, in some measure, of specific advantage to the individual. The characteristic of the decade 1914-24 has been the great growth of the latter revenue source.

American Revenues. The following figures furnish a brief survey of principal sources of revenue in the United States since 1900:

Year	Total	Customs	Int. Rev.	Income and profits tax
1840	\$19.5	\$13.5
1845	30.0	27.5
1850	43.6	39.7
1855	65.3	53.0
1860	56.1	53.2
1865	333.7	84.9	\$209.5
1870	411.2	194.5	184.9
1875	288.0	157.2	110.0
1880	333.5	186.5	124.0
1885	323.7	181.5	112.5
1900	567.2	233.2	295.3
1905	544.2	261.7	234.0
1910	675.5	333.6	268.9
1912	692.6	311.3	293.0
1920	6,704.4	323.9	1,442.2	3,956.9
1923	8,847.0	561.5	35.6	1,691.0

Reliance on Direct Taxation. Pre-war finances in many countries relied largely on indirect taxation. In the United States the Federal government was collecting in normal years the great bulk of its income from customs duties and internal revenue charges. During the early war years a small income from direct taxation was also obtained. Great Britain had long had the income tax in effect and it was producing substantially at the opening of the War. Nevertheless Great Britain also relied largely on indirect taxes and the same was true of most countries. The war necessities changed all this and hostilities greatly increased the total burden of taxation and made it absolutely necessary, in order to get the required funds, to rely largely on the proceeds of direct levies. Not only, therefore, was the total burden of taxation very greatly added to, but also the amount paid to governments as direct deductions from income not dependent upon purchase or the performance of specified acts was greatly enlarged. The effect of this change in method of taxation was undoubtedly to make the burden of the tax loads very much more obvious and to make it seem more serious than would have been true had it been collected entirely through indirect sources. Efforts to reduce budgets after the close of the War did not prove very successful and it was found in almost all cases that indirect taxation had been carried practically to the extreme of its productivity, while the income and excess profits taxes in this country which depended upon these sources of income predominantly had been raised to a point which was interfering with the growth of wealth. This latter consideration seemed to be of peculiar force in Great Britain and in the United States where during the early post-war years there was an obvious decline in the

amount of saving due to the fact that taxpayers of large income really engaged in business found it a matter of relative indifference whether to increase their business expenses to a point which consumed what might otherwise have been additional net income or to pay the latter in large part to the government. With rates on incomes running as high as 60 to 70 per cent the inducement to saving beyond a specified limit was not strong. Hence most post-war fiscal policies which aimed at budgetary economy sought to bring about such economy by a reduction in the burden of direct taxation. One outgrowth of this movement was the adoption in November, 1921, of the Income Tax Revision Law in the United States which eliminated the excess profits tax, while in Great Britain the budget estimates for the year beginning Apr. 1, 1922, abandoned the idea of further debt reduction during the year in question, excess profits taxes having already been repealed in 1921. The post-war taxation on the Continent naturally followed a somewhat different course because of the fact that during the War so great a reluctance to further tax increases had been made manifest. The necessities of such countries as France, Germany, and Italy after the War naturally dictated the imposition of new rather than the withdrawal of old taxes because of the necessity of providing means which would carry the very heavy interest charges resulting from the borrowing policies of the War.

POST-WAR FINANCE

Post-war finance, both in the United States and in Europe, has had three principal objects—the reduction or abolition of the enormous taxation of the war period, the funding and consolidation of the debts created during war, and the reduction of government expenditures. Coincident with these it has been necessary to find a means of beginning the restoration of banking systems to a sound condition in order that foreign exchange rates might be placed upon a more stable basis and the international flow of trade and of investments be correspondingly facilitated. One principal obstacle to success in these undertakings has been the tangle of indebtedness existing between the various countries. Such indebtedness represented the aid extended by one country to another during the War, but it was early perceived that in the last analysis there was but one great creditor, the United States and one great debtor, Germany. It was recognized accordingly that the key to the restoration of a sound system of post-war finance was probably to be found in the introduction of a satisfactory system of reparation payments which should enable the Allied belligerents to collect from Germany enough to enable them to offset the bulk of the losses to which they had been subjected and at the same time to settle with their external creditors. The Treaty of Versailles had made no definite disposition of these questions, leaving final settlement to the so-called Reparation Commission, which in March, 1920, announced a scheme of reparation payments whereby Germany's total obligation was fixed at 135,000,000,000 marks (pre-war gold value). Elaborate details concerning the payment of this sum were provided and the bulk of the cash proceeds was assigned to France, Belgium, and Italy. The Germans, however, failed to pay more than approximately enough to cover the cost of holding the occupied

German territory which had been taken by the Allies as security for the liquidation of their claims. Accordingly, France and, in a much lesser degree, some of the other countries that relied on the collection of German indemnities as a means of meeting their budget requirements were unable to obtain the funds necessary to settle the budget obligations they incurred in the belief that they would be able to transfer the cost to the Germans. Hence, their budgets failed to balance, and such reductions in taxation as occurred simply cut away the fundamental basis upon which a restoration of soundness would necessarily rest. Great Britain, which did not rely on any considerable receipts from Germany, was able gradually to restore her exporting power, despite some serious industrial obstacles such as the coal strike of 1921. The pressure for reduction of the terrible tax load was severe in all countries, but even in those where a cut might have been made, as in the United States, the recurrence of socialistic or semi-socialistic antagonism to wealth and capital resulted in the retention of many war taxes as a peace expedient. The Republican party, elected in the autumn of 1920, largely on a platform of tax reform, adopted in October, 1921, a so-called tax revision measure which, however, cut the burden of taxation but slightly, although technically repealing the excess profits tax. Great Britain likewise did away with the excess profits tax and similar action was taken in other countries. Nevertheless, in all the problem of rebalancing, the budget was seen to rest more and more upon the restoration of sound banking conditions.

Progress toward sound budgetary conditions was greatest in the United States and in England during 1920 and 1921. In the United States ordinary receipts up to November 12, for the fiscal year beginning July 1, 1921, exceeded ordinary disbursements by about \$155,000,000. The British budgetary situation was less satisfactory, showing deficits in 1920-21, although it was steadily improving. It must be remembered, however, that the main factor in tax policy which accounts for this unfavorable balance was the reduction in receipts from the excess profits tax. Although certain funds were still coming in on this account from excess earnings during earlier years, there was a decrease during the first six months of 1922 of £82,336,000 from the corresponding period of the year before.

In most of the Continental countries the budget situation during 1921, on the contrary, showed no real improvement; in fact, the reverse, although in the case of France and Italy a certain amount of relative advance was scored. In other words, the total amount of outgo of these countries which had to be made, not from the proceeds of taxation, but either from short-term bank borrowing or the issuing of currency, increased rather than diminished. Figures for Italian finances for the fiscal years ending June, 1921, and June, 1922, were still in the form of estimates, the actual accounts not being available at the latter date. According to the latest estimates, however, it appeared that the deficit for the year would be only about one-half that for the year ending in June, 1921. In other words, the estimated deficit for 1920-21 amounted to 10,300,000,000 lire, while the estimated deficit for 1921-22 worked out at 5,000,000,000 lire. The French government contem-

plated an expenditure for 1921 amounting to 42,412,000,000 francs, as contrasted with receipts of 23,312,000,000 francs, thus leaving a deficit of about 19,000,000,000 francs to be procured by the flotation of loans. Of this deficit, about 16,000,000,000 francs was regarded as eventually recoverable from Germany under the terms of the peace treaty. Of the ordinary receipts, 14,558,000,000 francs were expected from indirect taxes and monopolies. During the first half of 1921 the total public debt of France rose from 245,000,000,000 francs to 264,000,000,000 francs, calculating in both instances the foreign debt at par. This figure does not include loans floated by the cities and industries in the devastated regions, although the government is responsible for their interest and repayment. In the case of Germany close estimates of the total amount of government expenditures for 1922 were not available.

There has been a prevailing belief for a long time past that the principal element in the existing fiscal difficulties of many countries is to be found in their great outlay for war. This statement is true in broad terms, but requires to be qualified and limited in its application. In some countries, such as the United States, the outlay for war, while a very large part of the total outlay, is in large measure an expense which serves to carry the cost of past wars in the form of interest on public debt. While naval and military expenditure is large in such countries, it is a relatively moderate part of the entire budget. In other countries, like France, the current cost of military support still constitutes a very important fraction of the budgetary outgo. It has, therefore, been thought worth while to compile statements designed to show the comparative situation of the budget in several of the principal countries, with a view to ascertaining approximately how each one of them stands in this matter of expenditure for national defense, especially as compared with the pre-war years.

Compared with 1913, the last pre-war year, the amounts of money expended for national defense by the governments of France, Italy, and Germany show enormous expansion, but it should be remembered that the purchasing power of the currencies of these countries has undergone varying degrees of depreciation, and that the larger amounts for the more recent years, when reduced to 1913 monetary equivalents, will not show the same degree of expansion as is indicated in the table. During the war years the proportion of the total expenditures made for war purposes was in excess of 80 per cent in all three of these countries. In 1920, the proportion had declined to 60 per cent in Germany, to about 50 per cent in France, and, according to preliminary figures not included in the table, to less than 40 per cent in Italy; in Great Britain and the United States the proportion for the fiscal year 1921 was 26 and 24 per cent, respectively. Nevertheless, the financial burden upon taxpayers of these countries due to military expenditures was much heavier than before the War, since national production and income had suffered severely, and fiscal requirements for rehabilitation and reconstruction were an additional drain on national resources and income. While the proportion of total expenditures devoted to military purposes was, according to the fiscal returns, smaller in some countries in 1922 than before the War, these

* Total expenditures.

expenditures undoubtedly constituted a larger proportion of the diminished national incomes and were, therefore, a more crushing load on the financially weakened countries of Europe.

The accompanying table exhibits the post-war burden of taxation in some of the chief countries of the world:

PER CAPITA TAXATION	
United States	\$70.80 *
United Kingdom	99.43 *
Australia	28.16 *
Canada	35.05 *
Germany	243.42 *
France	94.23 *
Italy	22.80 *
Japan	7.38 *

* On basis of 1923-24.

* On basis of 1920-21.

The question whether some adjustment or alleviation of this tremendous burden can be devised has occupied the attention of statesmen since the close of the War but has confirmed most in the belief that heavy direct taxes will continue the chief reliance of most countries for a long time to come.

Government Activity in Business. The participation of the government in business, which before the War had produced a very considerable element in the revenue system of some countries (e.g. France, Germany, Austria and others), received a considerable extension in consequence of the War and of necessities attendant thereon, but the success obtained has been so slender as to produce a reaction of opinion among those who in former years regarded public activity of this kind as a probable source of future increase in revenue yield. Rail-

road operation, which was undertaken on an extensive scale both by Great Britain and the United States, proved an actual source of loss and was discontinued in both countries. The operation of ocean-going ships was equally disappointing and state manufacture of various kinds of commodities turned out even more unsuccessfully than during pre-war years. Instead of assuming an increasingly important position in budgets, revenue derived from industrial and business occupations has not only come to form a smaller and smaller proportion of total income; but, as just stated, it has been obtained under circumstances of such difficulty as to make it clear that it must be regarded as an inadequate reliance for the future.

Tariffs and Internal Revenue. Highest productiveness was believed by some to have been reached in the tariff system of the United States prior to the War, with a revenue of about \$350,000,000 as a maximum. In Europe, the productiveness of tariff duties had declined as rates increased. During the War, tariff systems fell into disorder and yielded far less than normal returns, owing to the interruption of international trade or its distortion as a result of war demands. After the War, a new era of tariff taxation set in, based upon the nationalistic spirit and essentially intended for protective purposes. The tariff of the United States adopted in 1922 (Fordney-McCumber Act) has been unexpectedly large in its yield, the annual income amounting to \$560,000,000. European tariffs continued in a tentative condition of development, owing to disturbances of trade during post-war reorganization, but also showed an increased rate of yield. One feature of the

tax system of the War was the great extension of internal revenue duties, especially taxes on articles of luxurious consumption. These taxes proved so unpopular that the greater share of

rience may be described as a universal advance in world indebtedness. The outstanding facts in the situation as affecting the principal countries are reviewed in the accompanying table:

DEBTS OF PRINCIPAL NATIONS AND AGGREGATE FOR ALL NATIONS OF THE
WORLD AT VARIOUS DATES
(In millions of dollars)

Dates	Austria	Belgium	France	Germany	Italy	Nether- lands	Russia	United Kingdom	United States	World
1913	3,799	825	6,300	1,200	2,852	462	4,500	3,500	1,193	42,940
1918	15,807	1,902	32,322	39,200	11,900	652	24,564	28,600	12,243	205,396
1919	28,584	1,888	42,700	48,552	15,009	981	24,564	37,221	25,482	295,070
1921	15,800	4,900	55,000	80,000	21,200	1,046	24,564	37,000	24,297	382,634
1922	6,708	65,921	1,984,475	22,816	.	24,564	38,009	22,350

them were abolished. The United States eliminated a large portion of its consumption taxes from and after Jan. 1, 1922. In all countries taxes on tobacco and liquors continued very heavy with increasing returns. In the United States, however, the adoption of the prohibition system largely eliminated the regular yield of the liquor taxes.

State and Local Taxation. As a result of war demands, local expenses as well as national greatly increased. Such increase in expenditure was met chiefly through an advance in the rate levied upon already existing objects of taxation. In the United States, however, State income and inheritance taxes were given a very considerable development while in some cases surtaxes were added. Real estate taxation became much heavier both in the United States and in Europe. Public debts were largely added to among local governments and the tendency to increase in that direction was furthered by bonus distributions to ex-service men, the borrowing for this purpose being rendered easier through exemption of bonds from taxation.

Budget of the United States. In all countries the importance of budgetary control was emphasized as a means of economy. An effort to introduce a budget system into the financial organization of the United States was made early in the administration of President Harding, being recommended in a message to Congress on Dec. 5, 1921. This was the result of about 12 years of discussion beginning during the administration of President Taft. On June 10, 1921, Congress approved a law providing for a national budget system and a bureau of the budget. Appropriations in Congress, however, continued in the hands of the numerous Congressional committees vested with the power of appropriation and resulted in preventing the development of a genuine budget system analogous to that of European countries. In fact, on various occasions Congress disregarded the budget estimates and appropriated money according to its own inclination. On the other hand, savings which were nominally introduced as a result of the budget system turned out to be illusory in some cases, owing to the fact that they were merely due to curtailments of allowances for upkeep which eventually had to be restored although temporarily interrupted.

Changes in Public Debt. It follows closely from what has been said with respect to public finance that the decade 1914-24 was notable in its relation to the public debt. Like the growth in public revenue and expenditure, the growth in debt was practically universal in all countries, although not proceeding in the same proportion in all; but in the main the expe-

Taxation in France followed a course rather different from that pursued in the United States. The first new impositions adopted in 1914 were made effective in 1916 and applied to incomes in excess of \$1000 with excess profits rates running up to 50 per cent. On July 1, 1916, a special war levy was made on all citizens who had not actually served with the troops, and fees and stamp dues as well as taxes on investments were raised all around. In 1917 and 1918 extensive luxury taxes were introduced. After the War, continuous legislation on taxation was proposed but the situation was never taken in hand very vigorously until early in 1924 when the absolute necessity of equalizing the budget became evident.

Germany, in the belief that the War would be short, attempted to do without new taxation but in 1915 provided for a substantial increase, applicable largely in the several German states. The Imperial government in 1916 imposed war profits taxes, excess profits taxes and others, besides taxes on transactions and various objects of consumption. In 1918, internal revenue duties were extended and the rates on war profits were made heavier. The system, however, continued inadequate and receipts were by no means comparable with outlays. A similar policy of waiting prevailed in Austria, although as the War progressed advances were made from time to time. Italy, on the other hand, recognized the necessity of heavier taxation practically from the beginning of the War, but was not very successful until the struggle was nearly over. In 1918, there were great extensions of luxury and consumption taxes and in 1919 a supplementary income tax. In the minor European countries, no general or uniform policy was pursued, some increasing the revenues through taxation while others relied largely on loans and indirect taxes.

In the United States, as a result of continuous agitation, the administration of President Coolidge obtained from Congress at the session of 1923-24 the adoption of a more thorough plan of tax revision than that adopted in October, 1921, basing the demand upon the presence of an expected surplus in the budget for the fiscal year 1925. Among the minor European countries budgetary progress was slow, while in Germany the unsettlement with regard to reparations and the unsatisfactory industrial conditions resulted in continuous deficits.

As already incidentally noted, this growth in indebtedness is to be ascribed in part to actual military expenditure, in part to the protection of neutral frontiers and in part to the advance of prices and wages. Which one of these factors was predominant in any given country, is possibly a matter of secondary interest. The sig-

nificant facts relating to the debt situation are, first of all, the actual growth of indebtedness as just surveyed, and secondly the methods by which the debt position at the end of the decade was attained as throwing light upon the problem of reduction.

A feature which distinguishes the financial experience of the war period from periods of similar trial in the past relates to methods of public borrowing. During the War, a probably unprecedented use was made of the short-term obligation, while at the same time the plan of funding the short-term obligations thus incurred into long-term debt was carried to a higher point of development than ever before. The use of this method was practically identical in all of the belligerent countries, but naturally was carried on with far greater success in certain of them, owing to the fact that a greater degree of responsiveness on the part of the public was achieved in some than in others. This method of borrowing, as developed most successfully in England and the United States, was substantially as follows: A given quantity of revenue having been estimated as necessary within a specified period, funds were then obtained direct from the banks through the issue of certificates of indebtedness or treasury bills, or the equivalent. These short-term obligations usually ran for only about three months. The intent of every issue was to obtain steadily from the community a proportionate part of its current earnings and thus to make sure of drawing off from the general fund of commercial income a sufficient amount to provide for public necessities. In placing these certificates with holders, use was usually made of the central banking mechanism, the method being substantially the same in Great Britain and in the United States. Certificates issued by the Treasury were placed in the hands of reserve banks which distributed them at first voluntarily and later by a process of assignment to members. The proceeds were marked up on the books of the subscribing banks as a credit to the government. These deposits were then called

vanced the practice grew of making a small preliminary payment, borrowing the remainder at the buyer's bank. The result then was chiefly to convert the obligation of the government into the obligation of the individual citizen, presumably to be paid for out of his income or savings. As the floating debt outstanding increased in this way, and as the amount owing by bond buyers to the banks for the purchase of bonds increased, inflation naturally resulted, owing to the fact that bank credit was greatly outrunning in its rate of growth the rate of production of commodities. The effect was very largely the same as that which had been produced in former wars through the issue of irredeemable currency. Upon the close of the War, the stronger governments took measures to reduce their outstanding floating indebtedness, but during the first two or three years after the close of the struggle, the only countries that made any material progress in this direction were Great Britain and the United States. Italy later began to take steps along the same line but other belligerents met with no success.

Internal and External Loans. At the opening of the War, much discussion developed in all countries as to the relative advantage of internal or external loans. Embargoes and blockades made it impossible for some to borrow abroad, but the major belligerents, as the War advanced, tended more and more to draw upon foreign markets. The United States was naturally regarded as a primary source of such loans, although during the early year of the War London houses succeeded in distributing a great many of them. As the War advanced, investors grew more and more hesitant, and it became necessary to negotiate not with foreign investors but with foreign governments, either obtaining their permission or when possible inducing them to advance the funds themselves. Thus arose the enormous international obligations which assumed a size that was wholly unprecedented and in a very real sense constituted a new phase of national finance. The

EXTERNAL AND INTERNAL DEBT*

when necessary, the government giving as much notice as possible, and also endeavoring to pay out the funds as nearly as possible in the parts of the country from which they were drawn. After a period of some months had elapsed, a general loan was offered to the public and when subscribed, the proceeds were used to redeem the certificates and thus to reimburse to the banks the amounts they had advanced. Success in the method was dependent upon payment by buyers of the long-term bonds in actual cash or bank credit, but as the War ad-

table reviews for several of the belligerent countries the situation at about the opening of 1921 (when conditions were most critical) as regards the division of public debts between internal and external obligations.

Inter-Governmental Debts. When the United States entered the War it found nearly all of the Allied powers approaching exhaustion. England had previously made large war loans to the Allies; but could no longer continue them. Advances were accordingly authorized by Congress in 1917 from the Treasury of the

United States They were steadily made during the remainder of the War and were continued about eight months after the conclusion of the struggle. Thus a total sum of about \$9,500,000,000 was loaned, the proceeds being used in large measure for buying in the United States commodities that were needed for exports. The debts thus contracted were represented by temporary certificates evidencing the obligations in question and assigned by the representatives of the various borrowing European countries. Eventually the question of "funding," or providing for their definite payment and for the rate of interest they should bear meanwhile became a pressing question. No interest on them had been paid from the time of their issue and Congress eventually passed, on Feb. 9, 1922, the so-called Debt Funding Commission Act in which a commission of five, headed by the Secretary of the Treasury, was directed to make arrangements for settling the obligations of the various countries. These obligations consisted of the following at the time of the adoption of the Act:

NET OBLIGATIONS OF FOREIGN GOVERNMENTS,
UNDER AUTHORITY OF ACTS APPROVED
APRIL 24, 1917, AND SEPT. 24, 1917,
AS AMENDED (ON BASIS OF CASH
ADVANCES)

Belgium	\$347,691,566.23
Cuba	8147,000.00
Czecho-Slovakia	61,256,206.74
France	2,950,762,938.19
Great Britain	4,166,318,358.44
Greece	15,000,000.00
Italy	1,648,034,050.90
Liberia	26,000.00
Rumania	23,205,819.52
Russia	187,729,750.00
Serbia	26175139.22
Total	\$9,434,346,829.24

Accrued interest on this total was also due, besides some \$573,000,000 for surplus war supplies sold to various foreign nations. Great Britain, meanwhile, had advanced to Continental countries sums amounting in the aggregate to about \$8,500,000,000, a sum nearly as great as that lent by the United States. Some relatively small loans had likewise been made by sundry of the Continental powers to one another, France advancing nearly \$2,509,000,000. Out of this situation arose in 1919-22 the demand for international debt cancellation.

German Indemnity. The most troublesome phase of the debt situation produced by the War grew out of the establishment of an indemnity or reparation for Germany. (See REPARATIONS for an extended treatment of this subject.) Because of the inability of the Powers to hasten a settlement, the questions of international debts and reparations passed into a waiting stage which lasted well into 1924. The only important progress during the period was the funding of the British debt to the United States which was finally effected in January, 1923 (formal agreement June 18, 1923). Great Britain recognized the entire indebtedness and arranged to pay it over a period of about 61 years with an annual interest rate of 3 per cent, rising after 10 years to 3½. As the United States had outstanding the bonds which were issued to provide the funds advanced to Great Britain, and was paying 4½ per cent on them, the arrangement with Great Britain was equivalent to partial cancellation, although not technically so.

Change in Revenue Systems. In the endeavor to avoid unnecessary increase in debt, England and the United States early in the War resorted to heavy taxation, adopting income and excess profits taxes upon a large scale and particularly advancing the rates of surtax up to figures never before thought of. Other countries were slower to resort to heavy taxes because of the reluctance of their own citizens to submit to such control, yet it was practically inevitable that they should eventually do so and in substantially all countries there was an effort to get away from public borrowing and shift over to a basis of budgetary balance. Only by so doing, it was recognized would it be possible to restore a condition of solvency in the principal countries. The result of this necessity was to emphasize the finding of new sources of income and hence the reconstruction of fiscal systems. How this change worked may be noted from a comparison of the sources of income in France, Germany, and the United Kingdom, shown in the table on page 460.

Proportion of Loans to Taxation. Authorities on public finance prior to the War had generally taken the view that no public loan should ordinarily be floated without the imposition of taxation in an amount sufficient to provide for interest on the principal thus created and for an amortization or sinking fund sufficient eventually to extinguish the debt. At the opening of the War there was a widespread opinion among theorists both in the United States and Great Britain in favor of restricting loans to not over 50 per cent of total outlay, the balance to be raised by taxation. On the Continent, governments found their populations very restive under taxation and before the War were disposed to make use of deficit financing through public loans because of the already existing burden. During the War, both Germany and France relied largely on borrowing. No consistent policy of financing in this respect was pursued during the War.

Debts, Prices and Exchange. The growing proportion of debt both before and in a more striking degree after the War, as compared with the volume of national wealth, became an alarming feature because of the disproportionate absorption of national income in meeting debt charges. Inasmuch as existing debts were incurred in units of currency of the pre-war gold value, attempt to pay them in full at the close of the decade would involve an enormously greater transfer of wealth than that which was originally borrowed. Alternative to such a course would be the partial repudiation of the debts, either by "devaluation" (change in the gold equivalence of the currency unit) or by the so-called "capital tax," which amounts to an appropriation of enough of the wealth of the propertied class to pay the state's debt to that class. Some settlement of this question would be necessary if the countries were to attempt to restore a sound banking and currency system. The difficulty in the case is particularly marked in those countries which have heavy foreign debts because they must usually settle in terms of gold.

Relations with Banks. Owing to the fact that the War took all countries by surprise, bank loans were necessary in nearly every case in order to furnish funds for immediate requirements. This was an inevitable episode in war finance and was not open to criticism except in

so far as it might be adopted as a systematic policy. Fear of popular discontent led a good many countries to continue the short-term financing much longer than they otherwise would, the only countries that possessed the real internal strength to tax severely and effectively during the War being Great Britain and the United States. In falling back upon the banks, the various governments resorted to methods of borrowing that had not been tried in precisely the same form during the course of former struggles. Relatively small use of legal tender paper or "flat money" was made but the banks were required to take and distribute short-term obligations which were then funded from time to time into longer term loans as circumstances seemed to permit. The fact that the subscribers to these loans were encouraged to borrow from the banks the funds which were necessary in order to enable them to make good their subscriptions naturally tended to produce in all countries a highly inflated condition of prices, together with a steady disappearance of specie, notwithstanding an early embargo upon movements of coin which took effect in nearly all countries, comparatively early in the struggle although at slightly differing dates. The United States was the last to declare such an embargo, owing to the fact that it did not enter the War until the year 1917 was well advanced. Heavy borrowing at the banks in nearly all countries left these institutions at the close of the War in a very unliquid condition, their government paper holdings being "frozen" owing to inability to find buyers for them either at home or abroad due to the deterioration of public credit. But reliance upon foreign borrowing which was characteristic of practically all European countries that had found themselves able to get access to

other markets, left all of them at the close of the War with tremendous external obligations which they were in no position to liquidate, owing to the fact that as a result of the conflict their productive power had been very greatly decreased. An unavoidable consequence of the drawing off of a large share of the population from economic occupation had been in all a corresponding curtailment of productive effort. The close of the War, therefore, found practically all European countries facing a highly complex problem in public finance—that of reducing the cost of their government to such an extent as to make it possible to pay the necessary sums from the proceeds of taxation, thereby avoiding further borrowing while at the same time enlarging their surplus export power sufficiently to provide a balance large enough to furnish the necessary funds abroad with which to pay interest and maturing obligations. This latter necessity was the more obvious because of the fact that for one reason or another it had been found necessary to "release" a great deal of gold as the War advanced, thereby reducing the bank reserves and in some cases bringing the specie stock to so low an ebb that it was exceedingly doubtful whether any restoration of gold redemption could be brought about in the near future.

Results of Inflation Policy. The self-conscious inflation policy which was thus adopted by the belligerent governments soon proved disastrous. It was not only exceedingly disturbing to business, but it also defeated the efforts of the governments which resorted to it as a fiscal expedient. Price levels rose rapidly and enormously in nearly all countries, as may be seen from this table of index numbers:

^oEnd of year.

The effect of this advance in prices, brought about as it was by the practice of borrowing over heavily at banks, was to make commodities and services cost enormously more than they otherwise would. Particularly harmful results were experienced in the case of those countries which found it necessary to apply to foreign markets for munitions and supplies. Nearly all of the European countries had found themselves obliged at an early stage to buy heavily in the United States. Although the American price level had risen considerably even before the United States entered the War the advance had not been comparable to that which occurred at a later date.

Federal Reserve System. The war period with its sequel had a peculiarly important relationship to American banking conditions because of the fact that simultaneously with the opening of the War the United States had arranged to organize an entirely new banking system—the so-called Federal Reserve. This banking system had been framed entirely without reference to war necessities but was just on the point of taking effect when the struggle broke out in Europe. During the first two years—1915 and 1916—in which the United States was a neutral, the Federal Reserve System was practically in process of organization and the task of installing its various elements was in progress. Its business during that period was small; but with the entry of the United States into the active participation in the struggle early in 1917 the Federal Reserve System became a war banking system almost exclusively, and this character it retained until the struggle was over and the great advances made by the United States to European countries had been completed and the Liberty Bond issues largely growing out of them had been financed and digested by the banks and the public. Thereafter, the Federal Reserve System was able once more to turn its attention to the tasks of peaceful finance and to assist in restoring more normal conditions.

Immediately after the inauguration of President Wilson in 1913, a bill which had previously been developed under the direction of a sub-committee in the preceding Congress was introduced (June, 1913) and thereafter considered and adopted by the House of Representatives on September 17. This measure was considerably modified in the Senate but in conference committee it was amended back into nearly its original form, becoming a law on Dec. 23, 1913. As thus passed, the act provided for the establishment of a "Federal Reserve" System in which all national banks were obliged to take membership by subscribing 3 per cent of their capital and surplus to the stock of institutions to be organized in a number of districts throughout the country and known as Federal Reserve Banks. These banks were corporations chartered for 20 years under Federal authority, receiving deposits only from the government and from their member banks (though subsequently allowed to receive deposits from other banks under certain conditions), their chief duties being the issuing of notes and the holding of the reserves of their members. Their business consisted primarily of rediscounting paper for their members, although they were also authorized to buy paper (of the same kind that had been made rediscountable) in the open market, should they see fit. In issuing notes the Reserve Banks, as they were popularly

called, were authorized to deposit eligible rediscounted paper with their chairman (the Federal Reserve Agent), acting as trustee for the government, who then issued an equal amount of notes to the Reserve Bank. The latter then placed them in circulation by paying them out or handing them to members who had requested such accommodation. By a later amendment, gold might also be deposited with the chairman of the board in lieu of eligible paper. These notes were made obligations of the United States and receivable for all public dues. An organization committee, created under the act, eventually divided the country into districts and established twelve banks. Government control of the institutions was provided for by authorizing the Federal Reserve Board to name three out of nine directors for each of the reserve banks, the other six members being required to include three business men and three bankers, one business man and one banker being selected by banks voting individually, in each of three distinct groups (including the small, medium and larger banks of each district). It was further provided, in order to insure democratic government of the banks, that each bank should have but one vote regardless of capitalization. With reference to reserves, the act required that the 25 per cent reserve formerly required in central reserve cities be cut to 18 per cent of demand obligations; likewise also the 25 per cent formerly required in reserve cities was cut to 15 per cent, and the 15 per cent in other places was cut to 12 per cent. Of these reserves 7 per cent was to be placed by central reserve city banks with their reserve bank, 6 per cent by reserve city banks and 5 per cent by all others. Time deposits were made subject to a 5 per cent rate throughout. Federal Reserve Banks were to be authorized to pay 6 per cent cumulative dividends, after all expenses and allowances had been provided for, to their stockholders, and their remaining earnings were then to be paid to the government.

An important feature of the act on its foreign banking side was found in the authorization granted the larger national institutions to establish branches abroad and in its grant of the power of accepting time bills (not over 90 days' maturity) to national institutions. In its ordinary rediscount operations the reserve banks were limited to ninety-day paper growing out of commercial, agricultural or industrial transactions, speculative paper being barred.

The act as thus adopted was subsequently modified by 10 principal enactments. The important features in these amendments were: (1) enlargement of the acceptance power to 100 per cent of capital and surplus; (2) permission to national banks to subscribe to the stock of foreign banking enterprises formed for the purpose of establishing branches abroad; (3) termination of the reserve requirements of the original law and substitution thereof of a provision requiring all reserves to be kept in Reserve Banks, such reserve to consist of 13 per cent of demand deposits for central reserve city banks, 10 per cent for reserve city banks, 7 per cent for all others, with time deposits at 3 per cent; (4) adoption of the so-called Edge Act authorizing the formation of corporations for the purpose of making long-term investments abroad, national banks being permitted to subscribe to their stocks; (5) enlargement of amount of loans permitted to be made on the

strength of Liberty Bonds as collateral; (6) modification of voting arrangements governing the election of directors in Federal Reserve Banks, and a few others. Of these amendments the only one which fundamentally altered the structure and significance of the act was that transferring the entire reserves to the central institutions and the Agricultural Credits Act of 1923 which gave special privileges to paper growing out of farm credits (see AGRICULTURAL CREDIT).

As provided for by the Act of 1913 the Federal Reserve System went into operation (preliminary details having been arranged by an organization committee) technically on the 10th of August, 1914, the banks themselves being actually opened for business on November 2, while reserves were paid over on November 14 of the same year. The two years 1915-16 were occupied largely in developing methods of discounting and establishing new plans of note issue. A constructive piece of work carried through during these years was the establishment of the Gold Settlement Fund at Washington whereby the Federal Reserve Banks were enabled to clear on the central set of books conducted by the Board the bulk of their obligations against one another, thereby avoiding the shipment of specie. This clearance, at first carried on only once each week, was later made a daily clearance, and eventually came to supersede in large part the work of the local clearing houses.

With the entry of the United States into the War early in 1917, a new epoch in the history of the Federal Reserve System and of the banking system of the United States in general opened. The fundamental problem at the opening of the War was that of finding means to supply the Treasury with necessary funds. This object was temporarily accomplished by direct borrowing from the Federal Reserve Banks on short-term treasury certificates. The system of Liberty Loans was then developed and the Reserve Banks were made the active agents of the Treasury in placing them. The Federal Reserve Act had originally provided for making the banks the fiscal agents of the government and this was now interpreted to include not only sub-treasury functions but also all those relating to the sale and distribution of bonds. The importance of the sub-treasuries accordingly was reduced and they were eventually closed in 1920, but during the latter part of the War and the period just after it their activity was purely nominal. With the issuance of the First Liberty Loan in July, 1917, the activity of the Federal Reserve Banks was largely transferred to a war basis including the management of public finance and continued so throughout the remainder of the struggle.

War Banking and Finance. From the date of the entry of the United States into the War, the function of the Federal Reserve System became almost exclusively that of financing the process of borrowing from the people. During the years 1917, 1918, and 1919 the government increased the national debt from a little over \$1,000,000,000 to a little over \$25,000,000,000. These great loans were for the most part placed first through the banks and then with the rank and file of the investing public. It would probably have been impossible to dispose of the enormous quantities of bonds which the government was obliged to sell in

order to provide itself with funds without some kind of special banking aid. Such aid was particularly necessary in view of the fact that it had been determined by the Treasury authorities to dispose of the bonds at a rate of interest quite materially below the prevailing rate in the market. The first issue of Liberty Bonds was sold at $3\frac{1}{2}$ per cent and as subsequent issues were put out the rate was gradually raised until it reached $4\frac{3}{4}$ per cent on the fifth, the Victory Loan (1919); although it should be remembered that the first loan bearing $3\frac{1}{2}$ per cent had been wholly exempt from taxation of all classes, while subsequent loans were only partially so exempt. That the public might be induced to purchase up to the full extent of its saving power, paying for the bonds it thus bought on the installment plan, Federal Reserve Banks were instructed by the government through the Federal Reserve Board to fix a rate for the rediscount of paper equal to the coupon rate on the Liberty Bonds. Commercial banks generally were induced to discount directly for their customers at the same figure. Thus a buyer of bonds who was unable to pay for them in full, borrowed from his bank the additional amount he needed, the bank carrying it without cost to him since the coupons provided for the borrower's own interest charge. The bank then rediscounted such paper at the same (coupon) rate with the Federal Reserve Bank of its district. This policy was very successful in "stabilizing" the rate of interest, but it also tended to transfer the principal burden for the time being at least to the banks. The system was perfected through the steady issue of Treasury certificates sometimes as often as twice a month, these certificates running for 90 days as a rule and being funded at the end of that period into the successive issues of Liberty Bonds which were then subscribed for and carried as indicated. The burden resting upon Federal Reserve Banks thus became heavier and heavier as the War advanced and as successive issues were sold. Hence the reduction of the reserve ratio (ratio of gold to demand liabilities) of the system, which fell from about 90 per cent before the War to about 52 per cent at the end of 1918, shortly after the Armistice. The fifth Victory Loan, which was floated early in 1919, was sold upon the same general principles that had been pursued in the earlier financing and resulted in increasing the burden resting upon the reserve system still further. The successful floating of this loan was followed by a speculative development of business and especially of foreign trade, which continued during the year 1919, and although checked early in 1920 did not reach its peak until about the close of the latter year.

Prices during the War had tended to rise rapidly as a result of a variety of causes. Of these the principal was the tremendous demand exerted by all governments for commodities, coupled with the natural shortage in production which resulted from the withdrawal of a large part of the productive labor of all of the Western nations for the purposes of war. A contributing cause of the rise in prices, however, was found in the suspension of specie payments and excessive issue of currency which produced the condition of "inflation" reflected in unduly high prices for commodities and services of all classes. This price and wage advance continued steadily up to a peak in May, 1920, at

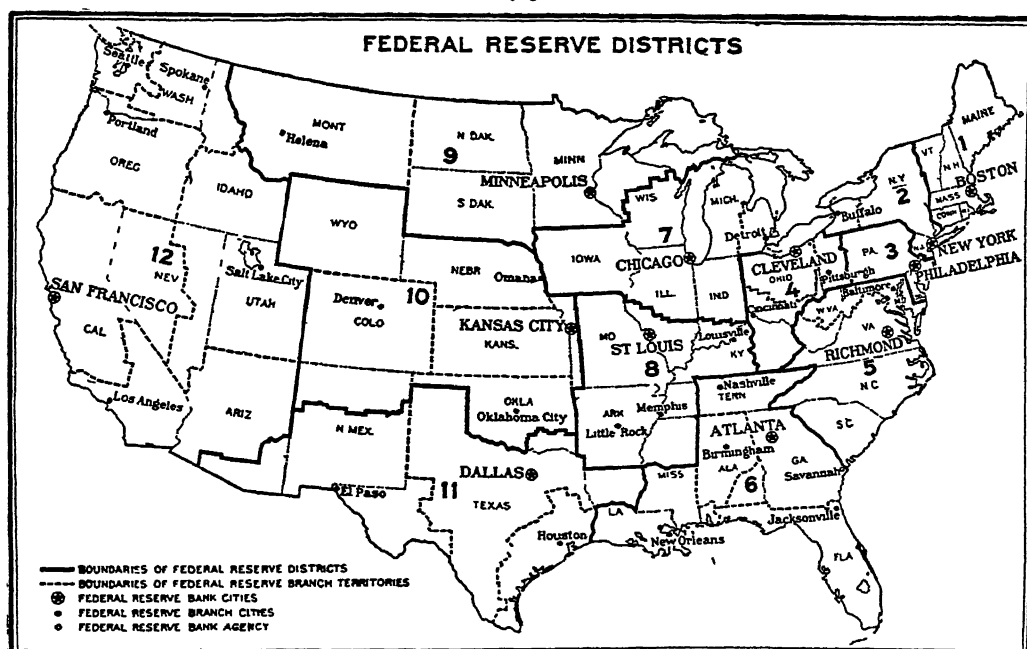

which time the index number of prices was approximately 270 measured from a base in 1913 taken as 100. The check to expansion and wholesale-price advance administered early in 1920 has been variously explained and has been popularly attributed in the United States to the fact that Federal Reserve Banks toward the end of 1919 resolved upon the so-called deflation policy. This deflation policy took form as an advance of interest rates above the low levels that had been established during the Liberty Bond period. It was aided by a more strict interpretation of the eligibility of paper for rediscount, coupled with an effort to induce borrowers who had obtained advances on Liberty Bonds as collateral to settle these loans and thus to take them out of the banks. The inadequacy of this explanation is indicated by the fact that the recession in business and prices which set in early in 1920 did not originate in the United States but was first indicated by the collapse of the silk market in Japan, while in most foreign countries no very definite deflation effort was undertaken until after the business recession had begun. Federal Reserve discounts, as already stated, did not reach their peak until the end of 1920, about eight months after the business decline had started. At that time total assets of the Reserve Banks were approximately \$5,000,000,000 while bills discounted were about \$2,700,000,000 and currency outstanding was about \$3,336,000,000. As the decline of business became more pronounced during 1921, the price level gradually sank to approximately 140, or a little more than half its level at the peak, while discounts at Federal Reserve Banks had been reduced by the end of 1921 to less than \$1,150,000,000. Notes at the same time receded to about \$2,400,000,000, thus contracting over one-fourth of their maximum amount. The inability of foreign countries to settle their enormous purchases in the United States had led during the War to very heavy advances made by the government to foreign governments and expended almost entirely in the United States. These advances were to be continued until about the middle of 1919, eight months after the Armistice, and amounted to about \$9,500,000,000. When they came to a close there ensued a period of trade expansion already noted during which considerable advances were made by American banks and business houses for the purpose of carrying foreign buyers as long as possible. As it became more and more evident that foreigners would not be able to liquidate these debts in full, banks and exporters began to withdraw these credits and the large movement of gold into the United States which had been very marked during 1916 and 1917 was resumed. From the opening of the War in 1914 to the close of 1923 the total net importations of gold into the United States amounted to about \$2,150,000,000 and the total gold holdings of the Federal Reserve Banks rose to about \$3,200,000,000. At the same time the ratio of reserve to liability advanced to approximately 78 per cent. One of the noteworthy services of the Reserve Banks during this whole period of unusual trial and strain was seen in the great reduction of bank failures, the total of failures at no time being large and in some years being practically negligible.

The general situation and development of the Federal Reserve System during the two years following the close of the inflation period was

substantially as follows: Immediately after the completion of the task of readjusting the discount rates and business which culminated in the spring of 1921, Federal Reserve Banks endeavored to return to a basis in which their principal activity would be devoted to commercial undertakings while they sought to divest themselves so far as they could of government obligations and to induce the investment public to take up and hold such securities. The result was a steady decline in their activity, since they had consistently refused to enter into any considerable competition with the larger member banks which held their stock. Coupled with this change of policy was a second remarkable transformation of their position, owing to the steady and great movement of gold into the United States, which resulted in building up enormous specie reserves in the hands of Federal Reserve Banks. The situation of the reserve system at approximately the close of 1923 may be conveniently reviewed in the table on page 465.

Development of Clearing System. The national system of clearance which has constituted one of the most outstanding achievements of the Federal Reserve Board under the mandatory provisions of the original act had attained only a moderate degree of development prior to the close of the War. It was not put into effect at the outset of the Federal Reserve operations but first took form in a definite way on July 1, 1916, when arrangements were made for collecting checks on member banks or on non-members which remitted at par without charge for exchange or collection. Credits and debits were entered upon a deferred basis corresponding to the amount of time required actually to collect the items. From the time that the system was fully inaugurated the totals transferred by this means rapidly grew, the system largely superseding clearing houses in many parts of the country, a number of the latter being closed in the meantime, as a result. Owing, however, to the fact that as a result of the clearance at par without charge many small banks lost a valued source of income, criticism arose and during the years 1920-23 hostile legislation was undertaken in eight southern States and suits were brought against reserve banks for the purpose of having their clearance function declared unconstitutional. In 1924, this litigation was still incomplete, although one or more cases had gone to the Supreme Court. In these the exercise of the clearance function had been upheld, subject to some important reservations. This resulted in reducing somewhat the total number of banks remitting at par, the remaining number being about 28,000.

European Banking Development. European banking was in a far more stable and completed condition at the opening of the War than was the banking system of the United States, but the strain to which it was subjected was far more severe, relatively speaking, than that to which the United States was obliged to adjust itself. In a general way, the principal effect of the War was to bring about an extensive redistribution of specie, a great reduction in the bank reserves of some countries, an even larger relative reduction in these reserves as compared with outstanding obligations and a very material alteration in the character of the investments held by the banks, this change taking form as a great growth in

* Figures as of last week in month.

the amount of government paper held by the banks and discounted for the several governments with a corresponding (relative) decrease in the amount of paper discounted for private citizens. A brief general survey of the banking situation of certain principal countries as it has developed during the period in question, and as it stands approximately at the end of the decade, is shown in the table on "Financial Statistics" on page 467.

Banking in England. Opening the War with a well coordinated money and banking system, Great Britain shortly found it necessary to resort to an embargo on gold and an issue of government notes. The result was immediate depreciation of currency, inflation of prices, and disturbance of exchange. This latter gave rise to a "pegging" of the rate as compared with dollars (and at the same time a pegging of francs in relation to sterling and dollars) the funds therefore being first supplied from the British Treasury and later through loans obtained from the United States. This situation continued until March, 1919, when the pegging was suspended and exchange left to take its own course, the embargo on gold being retained. Almost immediate reaction occurred in the value of sterling, steady recession taking place until Great Britain had been able in a measure to rectify her international position. The result was a general recovery which brought sterling up to a general level (at the opening of 1924) of about \$4.35, varying from day to day but showing substantial ability to maintain itself. The material improvement in the British budget which took place, and the slight reduction of indebtedness, together with the funding of Great Britain's debt to the United States, all tended to produce a more stable financial position and brought about a return of confidence in the value of sterling. Like other countries, Great Britain suffered quite materially from the elimination of inflation; and popular dissatisfaction occasionally compelled a suspension of drastic measures. The general situation of banking in England may be inferred from the tabular presentation already given but it is enough to say generally that improvement was steady and that if Great Britain could have been assured of a continuously favorable balance of trade it could have restored the gold standard at any time when the British public was willing to permit such restoration. On the other hand, there was a feeling among large groups in Great Britain that such action would probably tend to aggravate the depression and unemployment

in the country at large so that it would probably be well to defer such action until a more complete adjustment of reparations had been effected. This tended to defer action which otherwise might have been feasible looking to the retirement of legal tender notes issued during the War and the restoration of the convertibility of Bank of England notes into gold. Little change occurred in the general structure of Great Britain's banking system as a direct result of the War, although the creation of the Irish Free State separated a portion of the Irish banks from the general British money market, at least in theory, even though they continued to be closely associated with it in fact. Scotch and Irish notes, which had been made legal tender during the War, were deprived of that quality after the Armistice, while it should be remembered that the Currency and Bank Notes Act of 1914 providing for legal tender issues was not in form a temporary act, so that it might be said that there is no direct assurance of the restoration of pre-war conditions. There is no certainty how long the war changes in banking and currency, profound as they have been, will continue or when they will be offset by new measures. Meanwhile, the principal obvious mark left by the War upon the British banking system is to be found in the great concentration of banking which has occurred, there being today only about 25 banks in the United Kingdom of which by far the more dominating position has been assigned to five or six of the British institutions with headquarters in London.

Continental Banking. The outstanding changes in Continental banking which took place during the War were, in theory and effect, very similar to those in Great Britain, although usually assuming a more extreme form. In France, a moratorium was declared shortly after the opening of hostilities, applying to deposits as well as notes. This was soon ended but at no time during or since the War have Bank of France notes been convertible into coin. Large support has been given by the Bank of France to the government in the form of short-term loans, the result being an enormous increase in note circulation, although changes in the actual structure of banking in France have been fewer than in England. Provisions for the official control of exchange and prohibition of the export of capital were early introduced and have continued in effect. In 1924, France's banking problem was more than ever intimately associated with governmental budget conditions. The decline in exchange which carried the franc down into an ordinary level of about 5 cents soon after the opening of 1924 (a low point of 3.43 cents having been reached in the late winter of 1924), merely reflected the declining confidence of the foreign public in France and her budget management, due to the continuance of extraordinary budgets without provision to meet them, the continued insistence upon reparations at a rate probably out of the question, and the effort to rely upon inflation and short-term loans in lieu of taxation. Conditions became so alarming as to bring about pledges from the Poincaré Ministry in the spring of 1924 bearing upon the reintroduction of budget balances and heavier taxation designed to overcome existing evils. No progress in this direction had been made up to the close of spring of 1924, while the coming of the new ministry had left the situation still doubtful.

FINANCIAL STATISTICS OF PRINCIPAL FOREIGN COUNTRIES

ENGLAND (In millions of pounds)

^a Gold abroad, gold coin and bullion in Japan

In Germany, the shock to the banking system caused by the War was fully as severe as that felt elsewhere, but technically produced no great change during the continuance of the struggle. Early in August, 1914, the government provided for a legal tender currency which was later retired, its place being taken by Reichsbank notes. All notes and currency were declared inconvertible and a special type of loan banks was established. Partly as a result of strict military control and government regulation of prices, it was possible to maintain, up to the close of the War, a semblance of solvency. Immediately after the Armistice, this semblance largely disappeared, and rapid deterioration began, partly due to loss of specie, the restoration of the reserves to foreign banks which had been carried away, the necessity of

paying for large quantities of raw material abroad and other factors of the same sort. The outcome necessarily was the steady recession of the mark, somewhat aided by apparently intentional inflation with shipment of paper marks and mark obligations abroad. According to expert Committee No. 2 whose report was rendered to the Reparation Commission in April, 1924, careful investigation showed that Germans had in this way disposed of a total abroad of nearly 8,000,000,000 marks, receiving, of course, goods in exchange to an equal amount, the marks in the meantime becoming practically worthless. Increasing difficulty continued and was greatly emphasized by the inability to obtain any balancing of the budget or any adjustment or reparation claims. The result was to drive the mark down to practically

nothing, the quotation at about the close of 1923 being \$0 00000000000022. At this microscopic figure the mark was practically valueless and its place was rapidly being taken by foreign currencies. Decisive deterioration in the quotation of the mark had set in about the middle of 1922 and continued more or less steadily from that day onward to the autumn of 1923, when effort was made to obtain a substitute currency by organizing the so-called "Rentenbank." This was a bank whose obligations were secured by mortgages upon the lands, houses and industrial property of Germany, the unit in which they were expressed being designated as the "Rentenmark," presumably equivalent to the gold mark. During the winter of 1923-24, there was also gradually brought into existence under the supervision of Dr. Schacht, the so-called "Gold Diskont Bank," whose purpose it was to finance foreign transactions. This "gold" bank was such only in name as its capital was largely derived from English sources in sterling while its foreign payments were made in sterling, it being thus really a sterling bank rather than a gold bank. The reparation committee's plan called for a governmentally controlled bank which would supersede both of these emergency establishments as well as the Reichsbank and would reestablish a gold currency in Germany with corresponding stability in foreign exchange based upon the idea of conversion of outstanding currency at demand either into actual gold or into the gold currency of other countries at a specified rate of exchange. In the autumn of 1924, preliminary arrangements relating to this plan had only just been concluded. German banking had not changed greatly in its external form, but the same tendency to consolidation apparent in England was felt also in Germany and resulted in a reduction in the number of independent banks, accompanied by some increase in the degree of their dependence upon the Reichsbank.

In other European countries where central banking systems were in operation practically upon the same general basis as in England or France at the opening of the War, very much the same war changes were experienced. Practically all introduced gold embargoes which were continued after the close of the War and in most of them attempts were made, usually with but little success, to control the direction of foreign exchange. In Russia, practically the entire pre-war stock of specie was taken from the banks and eventually exported. Austria, too, lost her entire reserve of coin and was obliged to submit to a reorganization of her finance under the auspices of the League of Nations with a gold loan based upon or guaranteed by the Allies themselves. In Italy, conditions more closely resembled those of France, and the restoration of governmental frugality under Mussolini had the effect of stabilizing the lira and curtailing bank inflation. Among the so-called neutral countries such as Switzerland, Holland and Scandinavian nations, conditions varied somewhat, but the general drift was toward increase of gold owing to payments made by belligerents for supplies that they needed. The result generally was to bring about an over-expansion of gold reserves with a corresponding tendency to inflation in bank obligations. Altogether, therefore, the tendency was somewhat parallel to conditions among the belligerents although for different reasons. Subsequent to the

War this whole group of countries found itself better able to resume the free payment and movement of specie than before the struggle, yet disinclined to do it because of the fact that the principal customers were themselves on a paper basis. Efforts to bring about a "monetary union" between them, Great Britain and the United States, were not successful because of the fears in regard to the effect of such action on the competitive position.

"Colonial" and Oriental Banking. Conditions in the colonies of the various principal powers, prior to the War, had been generally dependent upon the situation in the parent countries. The War for the most part threw their systems of money and banking out of gear, partly by cutting off regular trade movement between them and the parent country, partly by leading them to declare embargoes, as in Canada and Australia, in the fear that otherwise they might lose their specie, as well as out of a sense of loyalty to the colonizing nation itself. As a result of these conditions abnormal difficulties were encountered in those parts of the world where the so-called gold exchange standard had been established, e.g. in India, the effort being there to bring about a conservation of specie and a fair stability of value. After the close of the War these difficulties disappeared in some measure, still leaving the dependencies, such as Australia, Canada, and others, inclined to move parallel to the currency of the parent country. In Japan, where an independent gold standard system had existed for many years, the embargo on gold early established during the War was maintained, notwithstanding that the stock of metal there was large and foreign trade in a fairly satisfactory condition. No serious changes in the structure of banking took place in the colonial or Oriental countries upon any considerable scale during the post-war period, perhaps the outstanding development being the creation of a reserve bank, closely modeled upon the Federal Reserve system, in South Africa. In other countries effort was made to popularize the banking systems and so far as possible rather to diminish the power of central oversight so far as practicable. Price movements in these economically dependent countries were naturally governed to no small extent by the price movements in the parent country, as may be seen by consulting the table of prices printed earlier in this article.

War Changes in Foreign Banking. The War naturally affected the banking systems of all nations very profoundly, resulting in most countries in an enormous expansion of credit both in the form of notes and of deposits, while practically everywhere the banks of the several countries became overloaded with government securities of various kinds either purchased for their own account or taken as collateral behind paper which had been left with them by customers for the purpose of carrying these bonds pending gradual liquidation of subscriptions to them. After the close of the War, the general development of banking in most countries passed through considerable changes of volume and character of transactions but the alteration in banking structure was comparatively slight. The general effect of the War, as noted above, was to tend toward concentration of banks—England, for example, reducing the number of institutions from upward of 100 to only about 25, of which five were of preponderating im-

portance In France, the drift toward concentration was not so strong because France had already reached a highly concentrated position in banking prior to the War. The War, therefore, found conditions ready to hand for the exercise of strong government control, while on the other hand such control did not produce the effect that was witnessed in England and elsewhere in drawing banks closer to the government because they were already very directly affiliated with and under the control of the public powers. In Germany, the Reichsbank became little more than a tool in the hands of the government, being used there for the purpose of floating short-term loans and later of issuing paper currency in almost unlimited volume to care for the needs of the government and avoid the necessity for heavier taxation.

Another phase of post-war banking was seen in the fact that the portfolios of practically all European institutions changed greatly. In lieu of the short-term paper which formerly occupied so nearly exclusive a place, the primacy was taken by government obligations and so-called short-term notes, "direct advances to the state," and other types of public obligations. The result was the maintenance of an inflated and unsatisfactory condition throughout the entire banking structure, solvency continuing to be entirely dependent on the condition of affairs in the public treasury, while prices were not able to react toward normal because of the continued inflationary influence to which they were subjected in consequence of the status of affairs in government relations with the banks. Still a third important change in the situation after the War was seen in the fact that so many banks and banking institutions were either driven into failure or obliged to go out of business or to amalgamate with others because they had become overburdened with non-liquid paper. The banks in such cases frequently were found to have ventured a good deal of their funds in foreign trade operations of one kind or another and there was great mortality and severe losses among the foreign banks of the world at large. In the United States there was a rapid, but not very successful, development of foreign banking during the War, owing to the fact that foreign, and especially English, institutions were so seriously crippled, and hence so little able to take care of the necessities of foreign trade. As a result the United States enjoyed an unequalled opportunity for the development of its foreign banking system and business, but it never succeeded in gaining a strong foothold; and after the reaction of 1920-21 when foreign trade showed such extensive and serious net losses, there began a movement to disestablish foreign banks which, numerically speaking, went very much further than in any other country, while at the same time the serious losses, which had to be recognized and written off as a result of the shrinkage of prices, became very pronounced. This, taken in conjunction with the readjustment of foreign trade, was perhaps the most striking economic-financial development of the entire post-war period in the business and credit world.

Banking, Prices, and Finance. The problem of banking, prices, and finance thus became unusually closely intertwined as a result of disturbance to revenue systems and to bank reserve holdings during the War and there was a dis-

position towards the end of the decade to treat the whole situation as essentially a large problem of public concern in which a restoration to soundness could be brought about only through the direct invocation of government assistance coupled with legislation. It was generally admitted that permanent recovery from the effects of war finance and restoration of stability in currency would involve certain standardized and fairly definite elements. Conspicuous among these was the restoration of a budgetary balance designed to bring about freedom for the central banks from constant demands on the part of government short-term borrowing. At the same time the necessity of bringing about, so far as possible, a uniform condition of the monetary standard in all countries trading with one another was recognized. It was thought that this might not necessitate the actual redistribution of gold coin, opinions differing as to the advisability of such a step, pending the time of full restoration of commercial and economic soundness; but it did imply the restoration of currency and banking convertibility into foreign standards of recognized stability and strength and in so doing it rendered the international monetary problem practically a uniform matter subject only to variations of local attitude growing out of the varying amounts of specie that were held, the varying conditions of public debt, budgetary balance and the like. Finally, it was recognized that in some way it would be necessary to bring about a scaling down or cancellation of international indebtedness on a fairly large scale, since without such cancellation, it would be practically impossible to develop a situation in which the various countries could meet their foreign obligations and provide the interest essential to keeping them alive.

Not only budgets but international debt and exchange conditions as well as the distribution of specie among the several countries were thus (in 1924) in a highly transitional condition in which the development of stability or a return to soundness must depend upon measures still to be taken, some of them of an international nature. Nothing could be expected for some time, owing to the fact that political conditions in the various countries and the persistence of race and national prejudice following after the War prevented the discussion of the economic problems presented upon a business basis.

Bibliography. The principal sources of information of war finance are still (1924) the financial reports of the various countries. For the United States the reports of the Secretary of the Treasury and the annual reports of the Federal Reserve Board give the most complete and authentic information. The League of Nations published, preliminary to the international financial conference at Paris, a series of documents which deal at great length with public finances during the War. Volume IV is perhaps the most useful of these publications. The following works are also of service in this same connection: Bogart, *Direct and Indirect Costs of the Great World War*; Anderson, *Effects of the War on Money, Credit, and Banking in France and the United States*; Gottlieb, L. R., *Financial Status of the Belligerents and Post-War Finance* (a series of four monographs issued by the Bankers' Statistics Corporation, New York, 1920-21); Benson, *State Credit and Banking during the War and After*; Seligman,

Currency Inflation and Public Debts (Equitable Trust Company, New York, 1922); *Hollander, War Borrowing*. Fisk, *Inter-Ally Debts* (New York, 1924); *Reports of the National Monetary Commission* (Washington, 1910-11); *Reports of the Comptroller of the Currency*; Kirkbride, Sterrett and Willis, *Modern Trust Company* (New York, 1921); Willis and Edwards, *Banking and Business* (New York, 1922); *Reports of Federal Reserve Board*, 1914-21; *Currencies After the War* (London, 1920). See **TARIFF**; **TAXATION**; **AGRICULTURAL CREDIT**, etc.; also paragraphs on *Finance* in articles on countries; and the article **STATE FINANCES**.

FINLAND. Formerly a grand duchy of the Russian Empire, but since Dec. 9, 1917, an independent republic, situated in the northeastern part of Europe on the gulfs of Finland and Bothnia. Area, 149,639 square miles, of which 17,100 square miles are under water; population (census of 1922), 3,105,103, as against 3,364,807 in 1920. The 1920 count was a gain (for the same area) of 224,399 over the last decennial period, or 7.2 per cent. The gain for the decade of 1900-10 had been 14.8 per cent. The population was preponderantly rural though with the twentieth century the urban population steadily increased. In 1900, 12.5 per cent of the population lived in towns; in 1910, 14.6 per cent; in 1920, 16.3 per cent. In 1920, there were 1026 females to 1000 males. Racially, the population was divided into Finns, 88.7 per cent; Swedes, 11 per cent; Russians, 1 per cent; Germans, 0.8 per cent; Lapps, 0.5 per cent. The National Church was Evangelical Lutheran, but liberty of conscience was guaranteed. At the end of 1920, there were 3,300,520 Lutherans, 54,791 Greek Catholics and Raskolnics, 404 Roman Catholics, 6614 Baptists, and 1618 Jews. During 1916-20 inclusive, emigrants numbered 16,678 of whom 16,597 went to America. In 1921, emigrants numbered 3557. The principal towns, with their populations in 1910 and 1922, were: Helsingfors, the capital, 200,-

Finland imported about 30 per cent of her cereals, mainly from Russia, but during the years 1914-16 this trade fell off about a fourth, and from 1917 on it decreased to about 3 per cent of its former quantity. The necessity for stringent regulation at once became evident and food-cards had to be resorted to. From 1910 on, large quantities of grain were imported from the United States. In 1913, cereal imports totaled \$17,505,100, in 1918, imports were only \$2,861,658; by 1921, they had reached \$13,756,740, and in 1923, \$19,004,850. The manufacture of dairy products, a thriving industry before the War, steadily declined during 1914-18 and by 1919 had not yet recovered. In 1914, there were 651 creameries; in 1919, only 431; in 1921, 462. In 1911-15, an average of 13,013,000 kilograms of butter were produced; in 1916-20, 8,803,000 kilograms; in 1921, 9,449,000; in 1914, 2,462,000 kilograms of cheese were produced; in 1919, 1,016,000; in 1921, 3,292,000. The same was true in the case of domestic animals. Not until 1920 did Finland succeed in making up the losses suffered during the War. In 1921, horses numbered 392,558 (294,264 in 1914); cattle, 1,791,947 in 1921 (1,167,112 in 1914); sheep, 1,572,444; swine, 374,636. The necessity for increasing the land-holding class was a concern of major importance in the country and from 1919 on the government consistently applied itself to that end. In 1919, 1920, 1921, state subventions were made for the purchase of new lands, and by the law of 1922, provision was made for the increase of small holdings created out of State and Communal property. The decision, by the law of 1919, to permit the tenant to pay for his rental in money instead of labor, was significant and pointed to the eventual destruction of the large estates through the elimination of cheap labor. The country's chief wealth lay in its forests and its water power. The forests of pine, spruce, and birch covered more than half the country, and the state forests alone included 33 per cent of the country's area. These yielded a considerable revenue, as may be seen from the fact that for 1920 the maintenance cost was 64,117,327 marks and the income derived, 130,625,765 marks. In 1913, wood and wood products (including pulp and paper) formed 75 per cent of the exports of the country. By 1921, these had increased to 79 per cent and in 1923, to 89 per cent. It was estimated that there were 3,000,000 horse power available in Finland's water courses, but these as yet had been tapped only slightly, as was indicated by the fact that only 100,000 were in use in 1920.

Mining. Mineral resources were still inconsiderable for want of capital, copper ore, magnetite, iron, pyrite being mined only in small quantities. In 1923, considerable deposits of kaolin, useful in the manufacture of porcelain and paper, were discovered near Wart-sila.

Manufacturing. The War played havoc with the country's industries, the cutting off of foreign markets, the unsettled political status,

RECORD OF CROPS (Official Figures)

Potatoes	6,602,533	7,031,261
Turnips	2,779,486	1,989,799

208 (1910, 147,218); Abo, 58,694 (1910, 49,601); Tammerfors, 48,475 (1910, 45,442); Viborg, 30,748 (1910, 27,508).

Agriculture. The census of 1920 listed occupations as follows: agriculture, 65 per cent; industry, 14.8 per cent; communications, 3.4 per cent; commerce, 3.4 per cent; others 13.3 per cent. Only 9.9 per cent of the land was under cultivation (4,959,568 acres), worked in small holdings mainly. There were 250,748 farms in 1920 (284,188 in 1910) of which only 14,891 (5.9 per cent) were 62 acres and over. Cereals and root crops were raised for home

Item	1914	1920	1921	1922
Number of enterprises	5,024	2,920	3,141	3,294
Number of workers	106,097	117,230	120,317	132,707
Gross value of output, 1000 marks	702,105	6,168,031	6,533,772	8,079,519
Exchange rate	\$0.198	\$0.034	\$0.019	\$0.021
Value in American dollars	\$135,506,265	\$209,713,054	\$124,141,668	\$174,857,000

consumption and by 1919 the yields reached the pre-war stability (see table). Before the War,

strikes, etc., bringing conditions to an exceedingly low level. With 1920, however, affairs

were on the mend, as may be seen from the foregoing table.

The most important industries, by number of workers, were, in order: wood industries, iron and mechanical works, textiles, paper, leather, graphic arts, tobacco. By 1921, relations between employers and workers were on a more amicable basis, industrial conflicts in 1921 almost reaching the low level of 1914. In 1914, there were 37 strikes and lockouts involving 6217 workers and lasting 1300 days; in 1917, the height of unrest was reached with 483 strikes involving 139,812 men and lasting 9383 days; in 1921, the figures were again normal, viz., 76 strikes, 6251 workers, and 1914 days out; in 1923 they fell to 49, affecting 7469 employees.

Cost of Living. During the War and well into 1923, the cost of living steadily mounted, adding to the privations of the population. Based on the index figure of 100 for prices as of July, 1914, in December, 1920, prices reached 1,103.2 and in 1923, reached the high figure of 1147. The exchange rate steadily continued unfavorable to Finland, reaching 29 marks to the dollar in 1920, 52 to the dollar in 1921, 46.7 to the dollar in 1922, and 37.4 to the dollar in 1923 (par rate=5.18 marks to the dollar).

Commerce. Imports and exports for typical years (based on the American dollar) were.

Year	Imports	Exports
1913	\$96,600,000	\$78,100,000
1918	63,076,500	28,355,400
1920	125,051,000	100,911,100
1922	84,700,000	95,600,000
1923	123,010,000	117,070,000

The year 1922 was the first in the annals of Finland to show an excess of exports (13 per cent). In 1913, the excess of imports had been 22 per cent while for pre-war years the import excess had ranged from 15 to 40 per cent. On the basis of 1913 prices, exports in 1922 were 93.4 per cent of those in 1913, and imports were 74.4 per cent of those in 1913. Nothing can indicate more plainly than these figures how rapidly Finland was approaching its normal status. Principal imports were in order of value: textiles; cereals; coffee, tea, sugar; metals; machinery; oils and fats. Principal exports in order of value were: timber; pulp and paper; animal products, mostly butter; hides and leather; animals; matches; gums, tar, etc. In 1913, the following countries figured in goods sent into Finland, in order of importance: Germany, Russia, Great Britain, Denmark, Sweden, Holland, Belgium. The United States was fifteenth with \$712. In 1923, the order was: Germany, Great Britain, United States (\$15,600,000), Sweden, Holland, Denmark. In 1913 the following were countries of destination of Finnish exports, by order of value: Russia, Great Britain, Germany, France, Holland, Belgium, Sweden, Denmark. Nothing was reported for the United States. In 1923, the order was: Great Britain, France, United States (\$9,200,000), Holland, Belgium, and Germany.

Communications. In 1911, there were 2332 miles of railway; in 1923, the mileage was 2765, all but 184 miles of which belonged to the state. In 1921, there were 2525 post offices, 10,517 miles of telegraph, and 3230 miles of telephone wires. In 1913, 11,901 vessels entered Finnish ports, with cargo 1,668,000 tons, in ballast 2,028,000 tons; 11,937 cleared, of which with

cargo 3,374,000 tons, in ballast 255,000 tons. In 1923, a total of 7647 vessels entered, with cargo 1,696,000 tons, in ballast 1,763,000 tons; 7450 vessels cleared, with cargo 3,266,000 tons, in ballast 193,000 tons. In 1923, the Finnish merchant marine consisted of 683 sailing vessels of 102,111 tons, 781 steamers of 92,032 tons, 124 motor-driven ships of 18,649 tons.

Finance. On Dec. 31, 1923, there were 1,352,400,000 marks of the Bank of Finland in circulation. This was equal to \$33,400,000 at the current conversion rate. In 1914, there were 141,724,000 marks or \$27,352,732. Revenues in 1914 totaled 160,692,000 marks (\$32,777,556); in 1921, 2,887,179,000 marks (\$44,260,000); in 1923, 3,913,526,545 (\$104,491,170). Expenditures in 1914 were 185,987,000 (\$35,895,491); in 1921, 2,698,135,000 (\$51,887,211); in 1923, 3,497,446,804 (\$93,381,800). In 1914, the total debt was 171,186,038 marks (\$33,038,905). At the end of 1923, it was \$80,600,000, at current rates of exchange, including \$63,500,000 of foreign debt and \$23,100,000 of internal debt. In 1923, a loan of \$10,000,000 was floated in the United States while arrangements were made for floating Finland's debt to America.

Education. In 1922, there were three universities, the Swedish university at Abo being opened in 1919 and the Finnish university at Abo in 1922. There was a total of 2819 students. For secondary education there were 85 lyceums, 31 middle schools, 26 girls' colleges, with a total student body of 28,839. There were in all (1921) 7214 elementary schools with 531,393 pupils. Besides, the educational system included schools for the teaching of navigation, commerce, arts and crafts, agriculture, forestry, etc. In 1921, there were 254 newspapers and reviews in Finnish, 87 in Swedish, 10 in Finnish and Swedish, and 5 in other languages.

Defense. The army and coast defense were recruited on the basis of universal service. In 1922, the class called up for service numbered 18,000. An integral part of the defense was the voluntary Civic Protective Guards Organization, which in 1922 numbered 98,319. By 1924, Finland had no battleships. The army and navy budget for 1922 amounted to 12.5 per cent of the total material expenditures.

History. The War brought Finland relief from the Russification policy which had been carried on with an increased intensity during the decade preceding the outbreak of hostilities. The years 1914-17 witnessed an abatement of the Russian programme, with the result that though Finns received no new political liberties their industrial growth was considerable. The manufacture of war materials was prosecuted advantageously, so that the cities grew affluent while the countryside, deserted by labor flocking to the cities, steadily declined. It could not be said that the Finns hoped ardently for a Russian victory, for enlistments were surprisingly few. Yet the Russian Revolution of March, 1917, was hailed with mixed feelings. The growing industrial activity had increased the size of the Social Democratic party and accessions to the workers' ranks had been made from Russia in which the workers had been impregnated with revolutionary ideas. The bourgeois classes feared as much the dominance of this group as they had the former Russian autocracy. One of the first steps of the Kerensky government was to restore representative

government to Finland. The Diet met on Apr 5, 1917, and it was immediately evident that the Social Democrats were in control. Attempts were made by the radicals to set up an independent Finland, at least politically and economically, and altercations went on with the Russian government until the advent of the Bolsheviks. Affairs were further complicated by the epidemic of strikes which broke out in 1917, and the threatening famine due to the breakdown of agriculture.

In the new Diet, elected Oct. 2, 1917, a bourgeois bloc forced out the Social Democrats and, fearing the collapse of Russia with the attendant economic ruin, immediately issued a declaration of independence (Dec 5, 1917). The Bolshevik government finally gave its assent on Jan 9, 1918, and this was followed by recognition on the part of Sweden, Norway, France, Spain, Denmark, and Germany. The following year was a tragic one. The Social Democrats were averse to breaking relations with Russia, for such a connection meant the extension of communism into Finland. The bourgeois elements, on the other hand, fearing for the new-found wealth that had come from war manufactures, desired a connection with either Sweden or Germany. The result was the appearance of "White Guards" and "Red Guards," the latter being augmented by the influx of Russian soldiers. War broke out everywhere, beginning with the seizure of Helsingfors in January, 1918, by the "Red Guards," the establishment of a soldiers' and workers' council, and the inauguration of a Red Terror. The ready success of the Bolshevik forces and the inability of General Mannerheim, leader of the "White Guards," to cope with the situation led the government to appeal to Sweden and Germany for aid. Sweden very wisely declined, refusing to be embroiled in the War; Germany, however, was very quick to embark on the adventure. The treaty of Brest-Litovsk was signed Mar. 3, 1918. On Mar. 7, 1918, the Finno-German treaty was signed, and to all intents and purposes Finland was a German vassal. General von der Goltz, head of the German forces, immediately landed on the Åland Islands and thus was able to take the Red forces in the rear. Victories by von der Goltz and Mannerheim immediately followed: Helsingfors was retaken, and by May, 1918, the revolution was crushed. The White Terror that was inaugurated accounted for from 15,000 to 20,000 victims, and almost 100,000 men and women were thrown into jail.

The reactionary government that followed, under the dictatorship of Senator Svinhufvud, was completely under the control of von der Goltz, and attempted to erect a monarchy under a German prince, Frederick Charles of Hesse. It became plain that it was von der Goltz's intention to employ Finnish cooperation in a military movement on the Murman coast but the turn of events on the Western front made the plan impracticable. Fortunately the Armistice intervened to save Finland. In December, Svinhufvud, because of his pro-German tendencies, resigned, and Mannerheim, whose sympathies were monarchistic, was installed as Regent. During 1919, Mannerheim attempted unsuccessfully to ally Finland with the Entente powers in their adventure on the Murmansk front, but the reaction had swung in and from 1919 on Finland applied itself exclusively to its internal

problems. The Diet of Mar. 1, 1919, organized by a bloc of the Progressive-Agrarian parties (though the Social Democrats had a plurality), decided for a republic and on July 25, Prof Kaarlo Juho Stahlberg was elected first president over General Mannerheim, for a six year term. The republican government received international recognition, and, after signing a treaty for the protection of minorities, Finland was admitted to the League of Nations, Dec 16, 1920. One of Finland's leading aspirations was realized, when, on Oct. 14, 1920, by the Treaty of Dorpat with Soviet Russia, she received the Pechenga region on the Arctic Ocean. The significance of this port lies in the fact that it is open to navigation during the winter months because of the presence of the Gulf Stream. Eastern Karelia, on the other hand, was granted autonomy under Russia. During 1921, a local uprising in Karelia tended to alienate Russia and Finland, the former accusing Finland of complicity. Finland endeavored to carry the controversy into the World Court, but was thwarted by Russian opposition. The difficulty had not been adjusted by 1924 and hard feeling still prevailed. Another question of international importance was the disposition of the Åland Islands, claimed by Sweden on ethnographical grounds and by Finland because the islands were necessary for her national existence, being located as they were at the entrance to the gulfs of Bothnia and Finland. The matter was referred to the League of Nations in June, 1920, and a year later, the islands were granted to Finland. (See ÅLAND ISLANDS). Under the moderate coalition which continued in power after the election of 1922, the country made rapid strides toward regaining its stability and earned thereby the approbation of European powers and the United States. By the election of 1922, the Social-Democratic group was further whittled away and the government was formed by the Agrarian-Progressive bloc as heretofore. But a crisis was precipitated toward the end of 1923, largely as a result of the drastic measures taken against the Communist party. The cabinet fell from power, Jan. 16, 1924, and was succeeded by an interim government. New elections were announced for April, 1924.

FINLEY, JOHN HUSTON (1863-). An American educator and editor (see Vol. VIII). He was a member of the American Army Educational Commission (1918), commander of the American Red Cross for Palestine and the Near East (1918-19), editor of *Nelson's Encyclopædia*, and associate editor of the *New York Times* (1921-). In 1923 he was appointed exchange lecturer to Scandinavian countries under the auspices of the Scandinavian-American Foundation. Among his later works are *French Schools in War Times* (1917), *A Pilgrim in Palestine* (1918), and *The Debt Eternal* (1923).

FIORE, PASQUALE (1837-). An Italian jurist (see Vol. VIII). Revised and enlarged editions of two of his important works on international law appeared after 1914, *Il Diritto Internazionale Codificato e la sua Sanzione Giuridica: Studi* (1915), which contains in an appendix a summary of the most important international treaties from 1525 (English translation, 1918, New York); and *Trattato di Diritto Internazionale Pubblico* (1916), which contains (vol. iii) a discussion of war and its general effects, and of the rights and duties of

belligerents. He is the editor of *Il Diritto Civile Italiano Secondo la Dottrina e la Giurisprudenza* (1918). Pasquale Fiore is the subject of a discussion by Josef Muller in *Volkshbildung* vol. xix, under the title of "Die Stellung des Menschen im Völkerrecht nach der Theorie Pasquale Fiore" (1921).

FIRE PROTECTION. It was a somewhat striking commentary on the progress of civilization that, with the various means of safeguarding life and property, the losses due to fire in the United States and Canada increased rather than diminished in the period from 1914 to 1924. In fact the annual destruction by fire and conflagration fairly could be compared with that of war, yet it was impossible to arouse adequate public sentiment to deal effectively with this great menace. However, there were certain advances to be recorded in securing more adequate fire protection, and a hopeful movement towards fire prevention which was becoming more general. It was realized that much of the work of a municipal fire department should be in the field of fire protection and securing the enactment and enforcement of adequate regulations in the interests of public safety.

The National Board of Fire Underwriters continued their inspection of municipal fire departments and water supplies, and from time to time made valuable recommendations which were carried into effect and reacted to the benefit of the citizens by more favorable insurance rates. The decade under consideration witnessed the practical disappearance of horse-drawn fire apparatus in favor of motorized equipment which had reached a point where for speed and reliability, as well as for economy, it was able to function satisfactorily. By the elimination of the cost of maintenance for the food and care of horses it was possible to provide more adequate protection to the smaller cities and towns, and the increased speed of travel on the road and capability of achieving greater distances made possible coöperative action by the fire departments of adjoining towns. In some of the larger cities, particularly those on the coasts and the Great Lakes, independent high pressure services were installed or extended, and with the tall buildings of modern construction such independent high pressure mains were considered absolutely essential.

In the fire departments themselves it was interesting to note that along with the increase of technical interest and training, there was a marked advance in the spread of the fire prevention spirit and campaign. It was clearly evident there was a passing of the old type of fire fighter whose method and pleasure apparently was the throwing of vast quantities of water. The reduction of the number of fire alarms rather than the number of fires extinguished was beginning to mark the efficiency of a fire department and its chief, who was becoming both a public conservation officer and educator. Chief O'Brien of the Indianapolis Fire Department, who had to deal with an average of five or six fires a day from sparks on shingle roofs, made it a practice as soon as he had such a fire under control to deliver a lecture on the wooden shingle hazard to the crowd of men and women attracted by the fire.

For the protection of water fronts large and more powerful fire boats were being built with modern centrifugal and other pumps, and these were valuable adjuncts to most of the large cities with warehouse piers and other harbor facilities, as their pumping facilities could be brought to bear on fires not too far distant from the water front either through hose lines or permanent pipe systems.

In Europe where greater care ordinarily is exercised than in America there were not the same fire losses, and in England, in particular, there was a steady improvement in fire apparatus which manufacturers of motor equipment are turning out constantly on a more efficient basis. In Japan, in connection with the earthquake of 1923, the district including the cities of Tokyo and Yokohama, suffered from fire involving a loss in the former city alone of 134,103 residence buildings and 4488 other buildings, or about 74 per cent of the total outlay of building in the city was destroyed, while in Yokohama the destruction was even more complete. Of course the earthquake was responsible for much of this destruction, and it would be impossible to settle the damage done by the primary cause and that resulting from fire, but it was a very serious element in this disaster.

Showing the widespread distribution of American cities in which the fire losses exceeded five dollars per capita in 1923, as reported by the Annual Board of Fire Underwriters, the accompanying table is of interest, and when it is realized that a number of these cities have figured on a corresponding list for more than one year out of five the seriousness of the situation may be appreciated.

UNITED STATES CITIES IN WHICH FIRE LOSS EXCEEDED \$5.00 PER CAPITA
1923

° In this class four of the five years.

° In this class five years.

In the ten years from 1913 to 1923 the annual fire losses in the United States have continually mounted, reaching in 1923 the stu-

pendous figure of over half a billion dollars, and falling but \$10,000,000 short of the record property loss of 1906, the year of the San Francisco conflagration, when the destruction of property totaled \$518,611,800. The figures by years for the period under review are given in the following table.

COMPARATIVE FIRE LOSSES, UNITED STATES
1913-1923

	Population	Total Loss	Per Capita
1913—			
Whole country	97,163,330	*\$203,763,550	2.10
298 cities	33,281,804	* 74,576,608	2.25
1914—			
Whole country	98,781,324	* 221,439,350	2.24
298 cities	40,213,230	* 93,368,795	2.32
1915—			
Whole country	100,399,318	* 172,033,200	1.71
333 cities	35,161,266	* 68,886,218	1.94
1916—			
Whole country	102,017,312	* 214,530,995	2.10
329 cities	36,055,568	* 79,440,658	2.20
1917—			
Whole country	103,635,606	* 250,753,640	2.42
327 cities	36,557,011	* 89,438,398	2.45
1918—			
Whole country	105,253,300	* 290,959,885	2.76
328 cities	38,079,781	* 95,365,412	2.50
1919—			
Whole country	106,871,294	* 320,540,399	2.99
326 cities	39,898,869	* 103,028,285	2.58
1920—			
Whole country	105,683,108	* 447,886,677	4.23
370 cities	39,686,748	* 151,120,951	3.81
1921—			
Whole country	108,540,838	* 495,406,012	4.56
370 cities	40,324,918	* 141,406,007	3.51
1922—			
Whole country	109,955,947	* 506,541,001	4.61
366 cities	33,821,476	* 120,964,112	3.57
1923—			
Whole country	111,715,242	* 508,000,000	4.55
372 cities	42,946,639	* 147,102,119	3.42
* Estimated from Records of the Actuarial Bureau, National Board of Fire Underwriters.			

* Actual figures reported.

The same table shows the comparative fire losses for the whole country on the basis of population and for certain selected cities for which actual figures were reported to the Actuarial Bureau of the National Board of Fire Underwriters. It must be considered, however, in connection with these statements of fire losses that in the ten year period the burnable values had materially increased, and it was a source of some encouragement to fire underwriters that the proportion of fire losses to burnable values had shown a decrease. This was claimed to be the result of fire prevention efforts of various kinds but much more needed to be done to make such efforts effective.

The United States was suffering a vast drain on its total resources and the fire losses were vastly greater, both in amount and per capita than in Europe. This is indicated by the accompanying comparison of fire losses in the United States for three years in comparison with the corresponding figures for Great Britain.

Year	Great Britain	United States
1920	\$42,445,000	\$447,886,677
1921	38,820,000	495,406,012
1922	30,812,000	521,860,000

The population of Great Britain in 1922 was approximately 43,000,000 people, and the population of the United States for the same year was about 111,000,000. Consequently the per capita loss in Great Britain in 1922 was 72 cents as compared with \$4.75 for the United States. These figures indicated a continued decrease in the British fire loss, and a marked increase in losses in the United States. See INSURANCE; also FORESTRY, section *Forest Fires*.

FISCHER, EUGEN (1881-). A German writer, born at Balingen, Württemberg, and educated at the University of Tübingen. After teaching in the University of Berlin, he became a free lance writer, specializing in articles on the responsibility for the War. He was made press secretary of the Reichstag commission inquiring into pre-war history. Besides newspaper articles on cultural and political subjects, he is the author of *Der Kampf um Gott, Das Reich des Lebens*, an historical novel; *Woodrow Wilsons Entschluss*, political scenes; etc.

FISCHER, MARTIN HENRY (1879-). A German-American physiologist and pathologist, born at Kiel, Germany. He came to the United States in 1885 and took a degree at Rush Medical College. Having held subordinate positions in the department of physiology in the Universities of Chicago and California, he became full professor in the University of Cincinnati in 1910. He is known especially for his original research into the nature of nephritis and has been instrumental in bringing the subject of focal infection before the German medical men; he has also made a number of German works on physical chemistry available to English readers by his translations. In addition to many articles in periodicals he has published *The Physiology of Alimentation* (1907), *Edema* (1910), *Nephritis* (1911), and has translated Cohen's *Physical Chemistry* (1903), Pauli's *Physical Chemistry* (1906), Ostwald's *Handbook of Colloidal Chemistry* (1915), and Ostwald's *Introduction to Colloidal Chemistry* (1917).

FISH, CARL RUSSELL (1876-). An American historian, born at Central Falls, R. I., and educated at Brown and Harvard Universities. In 1900 he became professor of history at the University of Wisconsin, and was research associate at the Carnegie Institution in 1908-09 and director of the British branch of Historical Service, 1917-20. His works include *Development of American Nationality* (1913), *American Diplomacy* (1915), *The Path of Empire* (1919), *Guide to the Study of American Diplomacy* (1919), and many articles on educational and historical subjects.

FISHBERG, MAURICE (1872-). A Russian-American physician and anthropologist, born in Russia. Having migrated to the United States in 1890, he took his medical degree at the University of New York in 1897. He is clinical professor of medicine at the New York University and Bellevue Hospital Medical College and physician to the Montefiore Home and Bedford Sanitarium and is a member of the American Anthropological Association. In 1897 he made a tour of Europe for the Bureau of Emigration; his report was published by the Government. He is one of the leading authorities on tuberculosis; most of his papers for the periodical press have been devoted to that subject. His major publications are *The Jew: a Study of Race and Environment* (1911); *Die Rassenmerkmale der Juden* (1913), and *A Treatise on Tuberculosis* (1916). He translated Gley's work on internal secretions from the French in 1917.

FISHER, ANDREW (1862-). An Australian statesman (see Vol. VIII). He was again Prime Minister of Australia in 1914-15 and was High Commissioner of Australia in England, 1916-21.

FISHER, DOROTHY CANFIELD (1879-). An American author, born at Lawrence, Kan.,

and educated at the Ohio State University and at Columbia University. In 1907 she married John Redwood Fisher of New York, and made her home on a farm near Arlington, Vt., and in New York City. In 1911-12 she and her husband went to Rome, where she made the acquaintance of Madame Montessori and helped translate her book about her pedagogical system. From this experience resulted her own book, *A Montessori Mother* (1913), which was translated into five foreign languages. During the War Mrs. Fisher edited a magazine for soldiers blinded in battle, cared for children from the evacuated portions of France, and managed the cooking and bought supplies for a large training camp for ambulance drivers. Her books include *The Squirrel Cage* (1912), *Mothers and Children* (1914), *The Bent Twig* (1915), *Hillsboro People* (1916), *The Real Motive* (1917), *Understood Betsy* (1917), *Home Fires in France* (1918), *The Day of Glory* (1919), *The Brimming Cup* (1921), *Rough-Hevn* (1922), *Raw Material* (1923), and *The Home-maker* (1924). She translated Papini's *Life of Christ* (1921).

FISHER, FRED (ERICK) B(OHN) (1882-). An American Methodist Episcopal bishop, born at Greencastle, Pa., and educated at Ashbury College (Wilmore, Ky.), Boston University, and Harvard University. He was ordained in the Methodist ministry in 1903 and in the next year went to India as a missionary, returning in 1906. From 1908 to 1910 he was pastor of the First Church in Boston and in 1910-20, served on the Board of Foreign Missions and in the Laymen's Missionary Movement. In 1920 he was elected bishop. He is the author of *The Way to Win* (1915), *Gifts from the Desert* (1916), *India's Silent Revolution*, in collaboration with Gertrude M. Williams (1919), and *Garments of Power* (1920).

FISHER, HERBERT ALBERT LAURENS (1865-). An English historian and educator (see VOL. VIII). He received honorary degrees from Edinburgh University (1913), Sheffield (1918), Manchester (1919), and Cambridge (1920). In 1915 he was a member of the government committee on alleged German outrages. Two of his later works are *Studies in History and Politics* (1920) and *International Experiment* (1921).

FISHER, IRVING (1867-). An American economist (see VOL. VIII). He was an officer of many organizations for the advancement of the public health. His later writings include *Why Is the Dollar Shrinking?* (1914); *How to Live*, with Dr. E. L. Fisk and others (1915); and *Stabilizing the Dollar* (1919). His views on the means of insuring a stable medium of exchange were the subject of wide discussion.

FISHER, SYDNEY GEORGE (1856-). An American lawyer and writer (see VOL. VIII). He wrote *American Education* (1917) and *The Quaker Colonies* (1918).

FISHER, WALTER KENDRICK (1878-). An American zoologist, born at Ossining, N. Y., and educated at Leland Stanford Junior University. He was special field naturalist for the United States Biological Survey (1897-1901); and Assistant (1902-05), acting instructor (1905-07), instructor (1907-09), assistant professor (1909-20), and associate professor (1920-) at Stanford. Professor Fisher was director of the Hopkins Marine Laboratory

(1917-). His published work was largely on the ecinoderms of the Pacific Ocean.

FISHERIES. A term of varied application but used here to designate organized governmental agencies which have to do with the collection of information concerning food supplies obtained from oceanic or inland waters and the application of this information to the problem of increasing or making these supplies more available to the citizens. In all countries where fishing industries are important, it has been the experience that there occur periods when there are noticeable decreases in the amount of these supplies to be obtained from the waters and this decrease is usually laid to injudicious fishing. As a result, a large part of the work of a fisheries bureau is to devise methods for increasing the supply, and legislation governing the methods to be employed in taking it.

In Great Britain, the plaice and herring industries have received most attention from this point of view, plaice investigations having been begun in 1908. McIntosh, an eminent Scottish zoologist, has argued strongly against the desirability of spending public funds for investigations of this kind, on the ground that so small an area of oceanic waters can be covered by fishermen that it is impossible that any decrease in the supply can be caused by fishing. He argues that seasonal variations in the number of fish are caused by climatic or other agencies beyond man's control and have been known to occur for hundreds of years. These criticisms by McIntosh are directed especially against the work of the International Council for the Study of the Sea, composed of representatives of all the countries bordering on the North Sea, in so far as the work of this Council is directed at repopulating by artificial means the waters under their control. This Council was organized in 1901 and was functioning successfully when interrupted by the War. After the War, it resumed operations, the first meeting later than 1913 having been held in 1920. Statistics covering the herring and plaice industries have appeared in its reports. An interesting development from the work of this Council has been the discovery of the breeding place of the eel. Grassi discovered, as early as 1897, that the eel does not breed in fresh water but its exact breeding place was unknown. It has now been determined that this breeding place lies between 20° and 30° of north latitude and 50° to 60° west longitude, or a region southeast of Bermuda. From there it migrates to the continents and goes up rivers to the localities where it is commonly found.

In the United States, the Bureau of Fisheries (originally the United States Fish Commission but now a Bureau under the Department of Commerce) has general supervision over the marine and fresh-water fisheries in United States territory as well as the fur seal, reindeer and fox industries in Alaska. Under its control are four main laboratories; at Woods Hole, Mass.; Beaufort, N. C.; Key West, Fla.; and Fairport, Iowa. In all of these it has been the policy of the Bureau to encourage abstract scientific investigation as well as researches having more immediate practical application. At the Woods Hole station formerly there were hatched each year large numbers of lobsters which were set free in the neighboring waters; but as it seemed impossible to enlist the co-

operation of the fishermen in the attempt to prevent the catching of the "short" or immature lobsters, the supply decreased so that it was difficult to get enough eggs for this work and it was discontinued in 1919. In this case, it would appear that McIntosh's position is not well taken, due perhaps to the fact that the lobster has a very limited range of distribution and is not an open-sea animal.

Invention of machinery making commercially profitable the manufacture of buttons from the shells of fresh-water mussels led to the establishment of the laboratory at Fairport, where much attention has been given to the problem of the propagation of mussels and of the fishes upon which the young mussels are parasitic for a period during their immature stage. The latest reports of the Commissioner indicate that owing to lack of funds the laboratories at Beaufort and Key West have done very little research work in recent years. At these stations, and at many hatching stations, the Bureau hatches large numbers of fish annually and distributes them to appropriate localities. During the year ending June, 1922, it distributed 4,925,981,320 eggs, fry and older fish in this fashion.

According to the latest report available in 1924, a period of extreme depression in the fishing industries, which was more severe in Europe than in the United States but very noticeable in the latter country, followed the War. This depression showed itself in a marked decrease in the amount of fish taken as well as in the prices obtained; it continued for some years, though by 1922 a slight improvement was noted.

A large part of the work of the United States Bureau of Fisheries consists of the collection of statistics relating to the fisheries, including the Alaska fur industries, and the reports of the Commissioner as well as the occasional *Statistical Bulletins* should be consulted for this information, which is too varied and voluminous to be summarized here. These statistics cover not only data relating to fish properly so called, but relate to a wide range of aquatic products covering oysters and clams, lobsters, shrimps and crabs, and sponges, as well as by-products such as whale and fish oil, shark and porpoise hides, agar-agar, shark fins, whale skeletons and oyster shells ground up for use as lime and poultry grits.

Much of the recent work of the Bureau has been extended to cover determination of improved methods for merchandising fishery products as well as the consideration of better preservation procedures in connection with canning and freezing, thus broadening the scope of its operations so as to include the final distribution of the products as well as encouraging their increase.

In Alaska, the predominant fishery interests have been connected with the salmon, but halibut, herring, cod and shrimps form an important part of the total catch. The peculiar spawning habits of the salmon make them especially easy to catch but this also leads to overfishing, with consequent depletion of the supply, another case where McIntosh's reasoning seems at fault, and this situation calls for constant legislative supervision. The taking of skins of the fur seals is now under strict supervision, it being decided annually how many should be taken. This has resulted in a desirable increase in the size of the herds and the establishment of the industry on a more durable

basis. For the year 1921-22, the total value of the sealskins taken (as determined by the prices paid at auction for them at St. Louis) was \$722,060. Blue-fox skins taken from herds kept on the Pribilof Islands for the year 1920-21 had a value, determined in the same way, of \$109,398. See ALASKA.

FISK, EUGENE LYMAN (1867-). An American physician and cofounder of the Life Extension Institute, born at Brooklyn, N. Y., and educated at the medical college of New York University. In 1898 he joined the medical department of the Equitable Life Insurance Company and later became medical director of the Provident Savings Life Insurance Company. In 1910 he accepted a like position in the Postal Life Insurance Company and in 1913 became the medical head of the Life Extension Institute. In collaboration (Fisher and Fisk) he wrote *How to Live* (1916) and *Health for Soldier and Sailor*. He is the author of *Alcohol: Its Relation to Efficiency and Longevity* (1917) and *Health Building and Life Extension* (1923).

FISKE, BRADLEY ALLEN (1854-). An American naval officer (see VOL. VIII). He was awarded a gold medal by the Aero Club of America for the invention of the torpedoed plane in 1919. His later writings include *The Navy as a Fighting Machine* (1917, 2d ed., 1918); *From Midshipman to Rear Admiral* (1919); *The Art of Fighting* (1920), and *Invention* (1921).

FISK UNIVERSITY. A coeducational institution for negroes at Nashville, Tenn., founded in 1868. Dormitory limitations prevented much variation in attendance, which was 516 in 1914 and 517 in 1923-24, exclusive of the summer registration. For its rigid emphasis on high standards in all departments it was aided during the decade by the General Education Board, the Carnegie Foundation, the Carnegie Corporation, the Phelps-Stokes Fund, the Slater Fund, the American Missionary Association, the Harmon Foundation and the Juillard Foundation. Fisk received, chiefly from the General Education Board and the Carnegie Corporation, the sum of \$150,000 in 1917; in 1920 the General Education Board offered to give \$500,000 on condition that the University raise \$1,000,000. The faculty in 1923-24 numbered 71. President Fayette Avery McKenzie, Ph.D., was inaugurated in 1915.

FITCH, ALBERT PARKER (1877-). An American educator, born in Boston, and educated at Harvard University and Union Theological Seminary. He was ordained in the Congregational ministry in 1903, subsequently holding various pastorates, and becoming president of Andover Theological Seminary at Cambridge in 1909. In 1917 he resigned to accept the professorship of the history of religion at Amherst College, where he was one of those who withdrew from the faculty on the resignation of President Meiklejohn in 1923. In 1919-20 he was Beecher lecturer at Yale University. He is the author of *The College Course and the Preparation for Life* (1914), *Religion and the Undergraduate, Can the Church Survive the Changing Order?* (1920), and *Preaching and Paganism* (1920).

FITE, WILLIAM BENJAMIN (1869-). An American educator, born in Marion, Ohio. He studied at Hillsdale College and took post-graduate work at Cornell. After teaching mathematics in the Academy, he served on the

faculty of Cornell as instructor and assistant professor in mathematics until 1910, when he was appointed professor of mathematics at Columbia. He wrote *College Algebra* and *First and Second Courses in Algebra*.

FITZGERALD, FRANCIS SCOTT (KEY) (1896-). An American author, born at St. Paul, Minn. He left Princeton University in 1917 to join the American forces and served as aide-de-camp to Gen. John F. O'Ryan (1918-19). Written with refreshing verve and promising talent, his books on the younger generation include *This Side of Paradise* (1920), *Flappers and Philosophers* (1920), *The Beautiful and the Damned* (1921), and a play, *The Vegetable* (1923).

FITZGERALD, JOHN DRISCOLL, (1875-). An American philologist (see Vol. VIII). He is professor of Spanish at the University of Illinois. His most recent work was a translation with Thatcher Howland Guild, *A New Drama by Manuel Thoma y Baus* (1915).

FITZMAURICE-KELLY, JAMES (1858-1923). An English writer and Spanish scholar (see Vol. VIII). From 1909 to 1916 he was professor of Spanish language and literature at the University of Liverpool and in 1916 gave a special course at Cambridge. He was the editor of the Romance section of the *Modern Language Review*, 1913-20, and one of the leaders in his field in his own and other countries. Among his later works are *Cervantes and Shakespeare* (1916); *Gongora* (1918); *Fray Luis de Leon* (1921); and *Spanish Literature Primer* (1922). He edited *The Oxford Book of Spanish Verse* (1913), *Samaniego's Fabulas en verso* (1917), *Iriarte's Fabulas Literarias* (1917), *Garcilaso de la Vega's Eglogas* (1918), *Poesias varias* (1918), *Complete Works of Miguel de Cervantes Saavedra*, and *Cambridge Readings in Spanish Literature* (1920). He also contributed to the *Cambridge Modern History*, *Encyclopædia Britannica*, *Homenaje a Menéndez y Pelayo*, etc.

FITZPATRICK, EDWARD AUGUSTUS 1884-). American educator and author, born in New York, and educated at the New York Training School for Teachers and Columbia University. He taught in the public schools of New York (1903-12) and later identified himself in that city with training schools for public service. In 1919 he became secretary of the State Board of Education in Wisconsin. He has published *Educational Views and Influence of De Witt Clinton* (1911), *Budget-making in a Democracy* (1918), and *Public Administration and the Public Welfare in Freedman's America and the New Era* (1920).

FIUME-ADRIATIC CONTROVERSY. The drawing of the boundary line between Italy and Jugo-Slavia was perhaps the most difficult problem before the Peace Conference, and continued to be a cause for dissension in Europe long after the peace treaties were signed. The territories in dispute were. Gorizia and Gradisca, Trieste, Istria, Dalmatia (all former parts of Austria), and Fiume (formerly belonging to Hungary). These lands, in the main, are separated from Jugo-Slavia by chains of mountains; in climate, economic, and cultural activities, with some exceptions, their orientation is plainly toward the west. While the Slavs made up the majority of the population, the Italians predominated in many of the towns,

and it was for sentimental, historical, and strategic, as well as economic reasons that Italian aspirations envisaged the acquisition of these territories. The nationalistic trend of the nineteenth century had made the region the scene of bitter struggles. In accordance with the Austro-Hungarian principle of "divide and rule," Slovene and Croatian hopes had been encouraged, as against the Italian, in the Austrian provinces; Hungary, on the other hand, had played off the Italians against the Southern Slavs in Fiume. Therefore, whereas an Italian irredentism was strong in the Austrian territories, it was correspondingly weak in the Hungarian. Because of these confused purposes there were no clear-cut programmes that either the Italians or the Southern Slavs could present at the outbreak of the War. It was natural, therefore, that the Italian claims, recognized by the secret Treaty of London (Apr. 26, 1915), were, in a sense, confusing. Italy gained the promise of Allied support to an Italian frontier which included Gorizia, Trieste, Istria, Northern Dalmatia and some islands to the south; Fiume was to remain in Croatia, on the supposition, evidently, that it was to continue to form a part of Hungary. The execution of this agreement would have meant turning over about 800,000 Jugo-Slavs to Italy. On geographical and cultural grounds there was indeed some justification for this. Gorizia, Trieste, and Istria (making up Venetia Julia), presented no real difficulty, for though in 1910 there were here 417,000 Jugo-Slavs and 356,000 Italians, the Slavic cultural and ethnical complexities were so many that the Italians were clearly the dominant group. As proof, the fact was urged that out of the 17 deputies in the Austrian Reichsrat for the three provinces, 10 were Italians. Dalmatia and Fiume involved other considerations. Dalmatia had 611,000 Jugo-Slavs in 1910 and only 18,000 Italians; and the Jugo-Slavs, politically, controlled every commune in the province but one. Italians, putting aside questions of ethnography, emphasized its alleged geographical unity with the west and its strategic importance, its long affinity with the Latin race and Italian culture, and the bitter fight which the communes of the province had fought with Austrian officials for the preservation of the Italian language in schools and administration (though by 1914 only one city, Zara, had succeeded in remaining Italian). On both sides there soon manifested itself a willingness to compromise these two points: Italy to get Venetia Julia, the Jugo-Slavs to get Dalmatia. Fiume furnished the basis of the real struggle. Fiume (together with its suburb Sušak) had a population distributed as follows: 22,488 Italians and 13,351 Jugo-Slavs in Fiume; 1500 Italians and 11,000 Jugo-Slavs in Sušak. The Fiumani had been encouraged in their independent spirit by the Hungarians and had derived great benefit from the Hungarian connection in that their city had served as the chief entrepôt of the Hungarian Adriatic trade. Italian nationalists, eager to obtain complete commercial and naval domination in the Adriatic, coveted Fiume not only because its upper class was Italian but also because it might rival Italy's newly acquired seaport of Trieste. The Jugo-Slav position depended on other factors. If the suburbs were included, Fiume was not Italian, but predominantly Jugo-Slav. Moreover, in order to connect Fiume with Italy,

large blocks of indisputably Jugo-Slav territory would have to be placed under alien sovereignty. Furthermore, the commercial hinterland of the city included Croatia, and Italian control of Fiume would mean the economic subservience of Jugo-Slavia, for Fiume was the only adequate outlet for Jugo-Slavia on the west. (In connection with this factor it must be borne in mind that perhaps one of the reasons why the settlement was such a tardy one was that the Fiume question was agitated only by the Croats and Slovenes while the more important Serbs manifested only a slight interest in the western frontier, for their natural trade outlets were the Danube and the Vardar.) So much for underlying considerations. On Oct. 20, 1918, Italian troops, at the behest of the Fiumani, occupied the town. The Allies, in their turn, protested on the ground that Fiume had not been assigned to Italy, with the result that an inter-Allied army took possession. The course of events before the Peace Conference was characterized by a bitter struggle that terminated in a deadlock. The Italians took their stand on the Treaty of London line, claiming Fiume as well on the ground that the dissolution of the Austro-Hungarian Monarchy had entirely changed the situation. The Jugo-Slavs found a champion in President Wilson, who stubbornly contested the Italian claims on the eastern boundary and supported a frontier which ran on the north along the London line to Tarvis and then dipped south along the centre of the Istrian peninsula. Fiume was to be internationalized though left within the Jugo-Slav customs union. (This was the well known "Wilson Line" presented Apr. 14, 1919.) That the Italians should be embittered was natural: they had entered the War largely as a result of the Treaty of London; they had the support of their allies in their claims; they demanded the territories for important strategical and cultural reasons. The failure to reach a compromise prompted President Wilson to issue his famous appeal of April 23 to the Italian people over the heads of their delegation. (See PEACE CONFERENCE AND TREATIES.) But the statement acted as a boomerang, for instead of winning over the Italian people it completely estranged them, with the result that Orlando's government, on June 19, was defeated in the Italian Parliament. All chances for a settlement, at least as far as the Peace Conference was concerned, had thus gone aglimmering. Meanwhile affairs in Fiume had steadily grown desperate. The Fiumani and the French soldiers in occupation fell out and rioting occurred; the disorganized economic life was producing real want among the population. Hence, When Premier Nitti showed a disposition to sacrifice Italian nationalistic claims in the interest of peace, Italian chauvinists took matters into their own hands. It was no wonder, therefore, that when on September 12 the poet-militarist D'Annunzio, at the head of a band of volunteers and Italian regulars, marched into Fiume, his coup de main should be received with such exuberant Italian approval. Italian soldiers and sailors in the port flocked to his standard and such eminent Italians as Professor Pantaleoni and General Ceccherini hastened to join him. The Supreme Council was spurred into action and during the next few months concerned itself with various programmes. The scheme proposed on Dec. 9, 1919, called for the

creation of a Fiume buffer state (for by this time Italy had dropped Dalmatia), which Italy, however, refused to support; a subsequent combined Italian-English-French proposal, Jan. 14, 1920, called for the assignment of Fiume to Italy with League control of its port and terminal connections, but to this both Jugo-Slavs and Wilson objected. Thenceforth the struggle became localized, and with the withdrawal of the United States from world affairs, the declining interest of Great Britain and France in the Adriatic, and the imminent defeat of the Democratic party in the American elections of 1920, it appeared evident to both disputants that only a spirit of conciliation would serve their best interests. In June, 1920, the Italians finally evacuated their last strongholds in Montenegro and Southern Dalmatia. On November 12, a treaty was signed by Italy and Jugo-Slavia at Rapallo which showed how much both had yielded. Italy was to annex part of Carniola and all Istria and push her frontier east to the confines of Fiume, Fiume was to be created an independent state though Sušak was to go to Jugo-Slavia; Italian claims to Dalmatia (except Zara) and almost all the islands (excepting Cherso, Lussin, and Unie) were renounced. Ratifications were exchanged Feb. 2, 1921, and the vexing business seemed on the verge of settlement when it leaked out that the Italian government privately had promised to turn over Porto Barros, a portion of the Fiume port, to Jugo-Slavia. Again the Italian public was aroused and again Fiume became the bone of contention. Meanwhile the D'Annunzio tangle had been straightened out. On Sept. 8, 1920, he had promulgated a singularly unconventional constitution, and this, with his continued impractical and flamboyant conduct, served to alienate the more serious elements which had joined him. In December he was ordered by the Italian government to evacuate the town, and on his refusal to do so, the signal was given to attack (December 24). Realizing the hopeless nature of his position, four days later he handed over his powers to the town council, and by Jan. 2, 1921, the Italian regulars were in control. D'Annunzio was ejected and steps were taken to establish the independent government provided for by the Treaty of Rapallo. Elections were held in April, 1921, for a Constituent Assembly, but the Italian nationalists, being defeated, destroyed the returns, and violence again prevailed. The Fascisti, who had organized themselves in sympathy with Italian Fascism (see ITALY), seized the city government and established a Fascist Directory. Difficulties engendered in Italian evacuation of the Northern Dalmatian zone necessitated the negotiation of the supplementary convention of Santa Margherita (October, 1922) between Italy and Jugo-Slavia, though even this did not much expedite matters, in particular as far as Fiume was concerned. In November, 1922, the Fascisti government came into power in Italy and Mussolini at once indicated that it was his intention to hasten a settlement. Independent local government in Fiume had proved itself a failure, though this may have been due to the interference of the Fascisti; economic life also was completely disorganized. In 1923, Mussolini exchanged a series of notes with the Jugo-Slav government relative to the status of the disputed city. As his demands for revision of the Rapallo Treaty and assignment of Fiume to

Italy were made in the peremptory style in which he had been accustomed to address the Italian Parliament, rather than with diplomatic suavity, the negotiations became increasingly acrimonious. When an Italian military force under General Giardini seized the city, a rupture of diplomatic relations and perhaps even graver consequences seemed imminent, but secret bargaining between Belgrade and Rome ultimately averted armed conflict. In January, 1924, it was announced that an agreement had been reached. The treaty, signed at Rome, three days later, ceded the city and port of Fiume to Italy, recognized Jugo-Slav sovereignty over Porto Barros, leased to Jugo-Slavia a port in the Fiume harbor, and made the Fiume railway station an international frontier station. Additional conventions signed at the same time recognized Jugo-Slav sovereignty over Dalmatia and Italian sovereignty over Venetia Julia. More significant than this settlement, momentous as it was, and clearly indicative of the Jugo-Slav attitude, was the treaty of friendship and alliance signed, by which Italy and Jugo-Slavia each pledged itself to maintain the "order of things established by the treaties of peace" and to remain neutral in the event of a war engaged in by either. It appeared, in 1924, to be a great forward step in the maintenance of European peace, and that the treaty was received with approval in Jugo-Slavia as well as in Italy indicated how general was the satisfaction.

FIVE-POWER NAVAL TREATY. See WASHINGTON CONFERENCE, and NAVIES OF THE WORLD.

FIXATION OF NITROGEN. See CHEMISTRY, and FERTILIZERS.

FLAMMARION, CAMILLE (1842-1925). A French astronomer (see VOL. VIII). Among his later writings are *Death and Its Mystery*, in three parts (1920, 1921, 1922), and *Haunted Houses* (1924).

FLANAGAN, JOHN (1865-). An American sculptor (see VOL. VIII). Although his work included such sculptures as the bronze memorial portrait of Samuel Pierpont Langley, Smithsonian Institution, and the Bulkeley Memorial, Aetna Life Insurance Building, Hartford, he was active chiefly as a medallist, especially during the War. He executed the "Médaille de Verdun," voted by Congress and presented to that city by the President. The fine realism of his portraiture and his subtle handling of lights and shadows made him preëminent in low relief.

FLANDERS, BATTLES IN. See WAR IN EUROPE, *Western Front*.

FLEMING, DANIEL JOHNSON (1877-). An American clergyman, born at Xenia, Ohio, and educated at Wooster University, Union Theological Seminary, and Columbia, Chicago, and Punjab universities. He was ordained in the Presbyterian ministry in 1903 and went to India in 1904 as professor of physics and director of Forman Christian College at Lahore. He remained there until 1913. In 1915 he was appointed organizing director of the department of foreign service at Union Theological Seminary, and in 1918, professor of missions. In 1919-20 he was a member of the International Commission on Indian Village Education. He is the author of *Social Study, Service and Exhibits* (1913), *Devolution in Mission Administration* (1916), and *Marks of a World Christian* (1919). He collaborated in *Village*

Education in India (1920) and *Schools with a Message in India* (1921).

FLEMING, JOHN ADAM (1877-). An American magnetician, born in Cincinnati. He graduated from the University of Cincinnati in 1889 and from that year to 1910 was with the United States Coast and Geodetic Survey. From 1904 he was chief magnetician of the Department of Terrestrial Magnetism at the Carnegie Institution, and from 1919 was chief of the Magnetic Survey Division. He was a member of several scientific societies and wrote reports on terrestrial magnetism and other subjects for the Carnegie Institution. He also contributed numerous articles to reviews and magazines.

FLEMING, WALTER LYNWOOD (1874-). An American historian, born at Brundidge, Ala., and educated at the Alabama Polytechnic Institute and Columbia University. From 1903 to 1907, he was professor of history in West Virginia University, and from 1907 to 1917, in Louisiana State University. In the latter year he was called to a similar position at Vanderbilt University in Nashville, Tenn. He was one of the editors of the *Historians' History of the World* and edited *Lester and Wilson's History of the Ku Klux Klan* (1905), *Documentary History of the Reconstruction*, 2 vols. (1906, 1907), *Section Six of The South in the Building of the Nation*, 12 vols., and the *Mississippi Valley Historical Review*. Besides being a contributor to numerous periodicals and encyclopædias, as well as to the *Photographic History of the Civil War*, he is the author of *Reconstruction of the Seceded States* (1905), *The Civil War and Reconstruction in Alabama* (1905), *William Tecumseh Sherman as College President* (1912), *The Sequel of Appomattox* (1919), and *Biography of Jefferson Davis and a History of the Ku Klux*.

FLEMISH MOVEMENT. See BELGIUM.

FLensburg. See SCHLESWIG.

FLERS, ROBERT DE (1872-). A French dramatist, born at Pont l'Évêque, and educated at the Lycée Condorcet in Paris. He devoted himself to drama and diplomacy. Among his theatrical works, which earned him a place in the French Academy, the undisputed masterpiece is *Le Roi*, written with Cavaillet and Arène. It combined the breeziness of a revue and the biting satire of Beaumarchais. His theatrical works include *Le Cœur a Ses Raisons*; *Les Sentiers de la Vertu*; *L'Âge du Foyer*; *Miquette et sa Mère*; *La Chance du Mari*; *Le Montausier*; *L'Amour Vieille*; *L'Éventail*; *Le Roi*; *Le Bois Sacré*; *L'Âne de Burdan*; *Papa*; *Primerose*; *L'Habit Vert*; *La Belle Aventure*; and *Monsieur Bretonneau*. His operettas and comic operas, written in collaboration with G. de Caillavet, are *Les Travaux d'Hercule*; *Chonchette*; *Le Sire de Vergy*; *Monsieur de la Palisse*; *Paris, ou le Bon Juge*; *Fortunio*; *Béatrice*; *Cydalisse*; *Le Retour*, and *Les Vignes du Seigneur*. Among his critical and fictional works may be mentioned *Vers l'Orient*; *Entre Cœur et Chair*; *Essais de Critique*; *Histoire de la Courtisane Tana*, and *La Petite Table*.

FLETCHER, FRANK FRIDAY (1855-). An American naval officer (see VOL. VIII). He was promoted to the rank of admiral in March, 1915. He was a member of the War Industries Board in 1917 and the general board of the navy, and was awarded a medal of honor for distinguished conduct in battle.

FLETCHER, HENRY PRATHER (1873-). An American diplomat, born at Green Castle, Pa., and educated at Chambersburg (Pa.) Academy. He was admitted to the bar in 1894 and served with the "Rough Riders" in the Spanish-American War. His diplomatic career began in 1902 when he was secretary of the American Legation in Cuba. After diplomatic service in China, Portugal, Mexico, and South America, he resigned in 1920, and was under-secretary of state from Mar. 8, 1921, to Mar. 6, 1922. On the latter date he accepted the post of Ambassador to Belgium. He headed the United States delegation to the Fifth Pan-American Congress at Santiago, Chile, in 1923.

FLETCHER, JOHN GOULD (1886-). An American author born at Little Rock, Ark., and educated at Phillips Academy (Andover, Mass.) and Harvard. He later made England his home. He has written *Fire and Wine* (1913), *Irradiations—Sand and Spray* (1915), *Goblins and Pagodas* (1916), *Japanese Prints* (1918), *The Tree of Life*, (1918), *Breakers and Granite* (1921), and *Paul Gauguin, His Life and Art* (1921). He was one of the first to essay free verse successfully and together with Amy Lowell was considered as leading the so-called Imagist school of modern poetry.

FLETTNER RUDDER. See NAVIGATION.

FLEWELLING, RALPH TYLER (1871-). An American philosophy professor, born at De Witt, Mich., and educated at the University of Michigan, Alma College (Mich.), the Garrett Biblical Institute (Evanston, Ill.), and Boston University. He was ordained in the Methodist Episcopal ministry in 1896, holding pastorates from 1903 to 1917, and in the latter year becoming professor and head of the department of philosophy in the University of Southern California. In 1918 he was at the Sorbonne, Paris, and was appointed head of the department of philosophy at the American Expeditionary Force University at Beaune, France. He is the author of *Christ and the Dramas of Doubt* (1913), *Personalism and the Problems of Philosophy* (1915), *Philosophy and the War* (1918), and *Bergson and Personal Realism* (1919). He also contributed to the *Hastings Encyclopædia of Religion and Ethics* (1917), and founded and edited *The Personalist* (1920). In 1919-20 he was president of the Celtic Club.

FLIGHT. See AERONAUTICS.

FLINT. A manufacturing city of Michigan. Its population increased 137.6 per cent in 10 years, from 38,550 in 1910 to 91,599 in 1920; to 117,968 by estimate of the Bureau of the Census for 1923, and to 135,000 by city estimate in 1924. This rapid expansion necessitated wholesale building operations and extensive public improvements. A civic building association built 3000 houses in 1916 and as many more in 1918. A city plan was elaborated, and in 1920, a programme for improvements costing \$2,215,000 was entered upon by the city; and in 1924, expenditures of \$13,325,000 for streets, sewers, schools, parks, etc., and \$10,800,000 for public service facilities were undertaken. Work was begun on a new State armory and athletic field. Three grade schools and a high school were completed in 1923 at a cost of \$2,250,000. Industrial building costing \$19,810,000 was undertaken in 1924. The number of employees in the factories increased from 8722 to 28,481 and the assessed valuation of

the city from \$35,267,451 to \$141,253,600 between 1914 and 1923.

FLOATING DOCKS. See DOCKS.

FLOODS AND FLOOD PROTECTION

The years immediately following the War were responsible for increased attention in many parts of the world to the great problems involved in reducing the damage and danger from floods caused by the overflow of rivers and sudden freshets. In China this problem has always been a pressing one, but as damage by flood always had been considered inevitable, but slight effort had been made to reduce the hazards by engineering plans and construction. In France the overflowing of the Seine and other rivers has brought temporary inconvenience and damage, and in 1910 after the City of Paris had experienced severe floods due to the rise of the Seine, a careful investigation was made of the best methods of protecting the city from the canal danger. By 1917 a comprehensive report dealing with this subject had been prepared and officially accepted, and from that time on various measures were taken to construct suitable protection works.

In the United States the spring floods had often brought about vast inundations of farming and other lands, while the sudden rise of waters had produced great damage and loss of life in not a few instances. In addition to the usual spring floods there were numerous cases where a cloudburst or protracted rain had developed swollen streams which had overflowed their banks, and in many cases had carried away bridges, dams and other works.

In this latter connection great danger has been increased, as where towns have been located on river banks they have often encroached upon the channel of the stream, and while the waterway would be ample in ordinary seasons yet at time of flood it would be too restricted to accommodate the suddenly increased flow. Furthermore, by the construction of bridges the channel often was seriously reduced by the piers and abutments, so that not only were these structures damaged, or at times entirely carried away, but the water was backed up with manifest injury when it overflowed the banks, particularly where cities or villages were located in proximity.

The great flood of 1913 in the United States along the Mississippi and its tributaries naturally led to the discussion of remedial measures, and in the interval between that time and 1924, important work in securing increased safety from the sudden rise of waters in the spring was put under way through strengthened levees and otherwise. Inasmuch as it was not every year that conditions of flood and disaster were experienced, it was quite difficult to arouse public sentiment to the necessity for preventive works, involving considerable outlay, which might not be actually brought into use for a number of years. Nevertheless there was more general appreciation of the seriousness of the matter and in many districts adequate measures were put on foot to secure the needed protection. Many investigations were made of the conditions of rainfall, watersheds, etc., and plans were developed suitable for the territory protected.

The flood danger in the United States ranged all the way from that experienced on the lower Mississippi, where a system of levees and other works had been maintained for a number of

years, to the Ohio and other tributaries where in addition more or less comprehensive projects for protection had been worked out. In many cases there was involved a system of retarding basins or reservoirs formed by dams and dykes which would collect and temporarily restrain the run-off due to melting snows or spring rains, and also straightened and enlarged channels which would take care of the great volumes of water by regulating the flow.

A notable instance of this was the work of the Miami Conservancy District which was completed in 1922, and by means of a system of dams and improved river channels afforded adequate protection to a considerable territory. Projects more or less similar were also advanced in other parts of the country, particularly those that had experienced flood damage, but even where danger was realized it was difficult to secure adequate attention to the danger, as these works involved heavy outlay which had to be met by bond issues or some form of taxation. Nevertheless, the country was thoroughly alive to the importance of the matter.

The Miami Conservancy scheme was designed particularly to afford adequate flood protection to the city of Dayton, above which city three large retarding basins were built, the Taylorsville on the Miami River, the Huffman basin on the Mad River, and the Englewood basin on the Stillwater River. Further up on the Miami was the Lockington reservoir while on Tivin Creek emptying into the Miami below the city of Dayton the Germantown retarding basin was built. Each of these reservoirs or basins was formed by a large earthen dike or dam pierced by conduits through which the water passed normally, but which at times of flood temporarily restrained the extra water until it could be discharged properly at the capacity of the channel which by straightening and levees was increased. This work was carried on by the Miami Conservancy District and in addition to the construction of dams and channels also involved extensive changes of location of railways and roads.

The protective works of the Miami Conservancy District experienced their first serious test in the flood following the rainfall of Mar. 27-28, 1924. Water was stored back of all the dams to the following depth above the conduit floors: Germantown 41.6 feet, Englewood 40.6 feet, Lockington 27 feet, Taylorsville 23 feet and Huffman 22 feet. Conduits ran full at all dams except Huffman. Maximum discharges at the dams were as follows: Germantown 6650 second-feet, Englewood 8400 second-feet, Lockington 5350 second-feet, Taylorsville 23,000 second-feet, and Huffman 13,000 second-feet.

In addition to the dams the improved channels, which were an important part of the project, received a test when gauge heights of 12.3 and 13 feet were reached at Dayton and Hamilton, respectively. At the former point the maximum discharge was 36,000 second-feet, while at Hamilton it was 42,000 second-feet. The flood handled, while in no way approaching the actual capacity of the system, demonstrated the ability of the flood control works to meet any emergency. It was estimated that without the protective measures the gauge height at Dayton would have been five or six feet higher, as under previous

conditions, and while it would not have caused much serious trouble, yet it would have developed considerable alarm among the low lying sections which was no longer felt.

FLORIDA. Area and Population. Florida is the twenty-first State in size (58,666 square miles), and the thirty-second in population, capital, Tallahassee. The population increased from 752,619 in 1910 to 968,470 in 1920, a gain of 28.7 per cent. The white population rose from 443,634 to 638,153; the Negro, from 308,669 to 329,487; the native white, from 409,792 to 595,145; and the foreign-born white, from 33,842 to 43,008. The urban population of the State increased from 219,080 to 355,825, the rural, from 533,539 to 612,645. The growth of the principal cities was as follows: Jacksonville (q.v.), from 57,699 to 91,558; Tampa, from 37,782 to 51,608; Pensacola, from 22,982 to 31,035; and Miami, from 5471 to 29,571.

Agriculture. Although Florida is not one of the leading cotton-producing States, cotton-raising is an industry of considerable importance. In the decade 1910-20, Florida was affected, like other Southern States, by the ravages of the boll weevil, which was well established in the State by 1916-17. (See *COTTON*.) The extent of this damage is indicated by a comparison of the acreage and production for several years. In 1913, 188,000 acres and 50,000 bales; in 1916, 191,000 and 41,000; in 1920, 100,000 and 18,000. The production in 1922 was 25,000 bales; the estimate for 1923, 13,000 bales.

While the population of the State increased 28.7 per cent in the decade, the number of farms increased 8 per cent (from 50,016 in 1910 to 54,005 in 1920); the acreage in farms from 5,253,538 to 6,046,691, or 15.1 per cent; and the improved land in farms from 1,805,408 acres to 2,297,271. The total value of farm property showed an apparent increase of from \$143,183,183 to \$330,301,717 or 130.7 per cent; the average value per farm, from \$2863 to \$6116. In interpreting this statement, however, and, indeed, all statements of comparative values in the decade 1914-24, the inflation of currency in the latter part of that period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. The percentage of the total area in farms increased from 15 in 1910 to 17.2 in 1920; the percentage of improved area in farms from 5.1 to 6.5. In 1920, of the total of 54,005 farms, 38,487 were operated by owners, 1829 by managers, and 13,689 by tenants; while corresponding figures for 1910 were 35,399, 1275 and 13,342. The white farmers in 1920 numbered 41,051, compared with 35,295 in 1910; colored, 12,954, as compared with 14,721. The farms free from mortgage in 1920 numbered 25,010 and those under mortgage, 8102. In 1910, those free from mortgage numbered 29,614 and those under mortgage, 5160. The number of beef cattle was 518,350 in 1920 and 845,188 in 1910; dairy cattle, 120,631 and 116,041; sheep, 64,659 and 113,701; swine, 755,481 and 810,069. The estimated production of the principal farm crops in 1923 was: Corn, 10,497,000 bushels; oats, 426,000 bushels; potatoes, 1,826,000 bushels; sweet potatoes, 2,830,000 bushels; tobacco, 4,158,000 pounds; hay, 89,000 tons, and peanuts, 49,920,000 bushels. For cotton, see above.

Comparative figures for 1913 are: corn, 10,125,000 bushels; oats, 900,000; potatoes, 912,000; tobacco, 4,000,000 pounds; and cotton, 59,000 bales. The increase in production of citrus fruits, from 1909 to 1919, was: oranges, 4,852,967 to 5,030,422 boxes; lemons, 12,367 to 31,204; grapefruit, 1,061,537 to 3,158,431.

Mining. Florida is not an important mineral-producing State. Phosphate rock is obtained in large quantities; and other resources include clay products, fuller's earth, mineral waters, and sand and gravel. The production of phosphate rock in 1914 was 2,138,891 long tons, valued at \$7,354,744; in 1918, 2,067,230 (\$6,090,106); in 1920, 3,369,384 (\$19,464,362); in 1921, 1,780,928 (\$10,431,642). The total value of the mineral products of the State was \$8,497,688 in 1914. It increased steadily from \$4,886,010 in 1915 to \$22,923,780 in 1920; but fell to \$12,597,948 in 1921.

Manufactures. Florida is not one of the important industrial States, although its manufactures have shown a steady increase in the last three decades. There are six cities with a population of more than 10,000 inhabitants: Jacksonville, Tampa, Miami, Pensacola, Key West and St. Petersburg. From these, in 1919, 47.8 per cent of the value of the State's manufactured products were reported. The total number of establishments in 1909 was 2159; 1914, 2518; and 1919, 2582; and the persons engaged in manufacture in those years numbered 64,810, 63,204, and 82,986. The capital invested was \$65,200,640, \$88,318,983, and \$206,293,570, respectively. In 1909, the value of the products was \$72,889,659; 1914, \$81,112,291, and 1919, \$213,326,811; but this increase was in a great measure due to changes in industrial conditions brought about by the War. The increase shown in the number of establishments and the average number of wage earners, however, is an index of decided growth in the manufactures of the State. The principal industries are those connected with lumber and timber products, with products valued at, in 1909, \$20,863,000; 1914, \$21,457,000; and 1919, \$50,409,000. Tobacco, cigars and cigarettes were second in value: in 1909, \$21,576,000; 1914, \$19,386,000; and 1919, \$37,926,000. Shipbuilding, especially during the War, acquired great importance, the value of the product rising from \$697,000 in 1909 to \$804,000 in 1914, and \$8,428,000 in 1919. Florida is first among the States in the production of turpentine and rosin; in 1909 the value of these products was \$11,938,000; 1914, \$9,573,000, and in 1919, \$21,509,000. Tampa is the first of the cities in manufacturing importance, with 182 establishments and products valued at \$13,804,000 in 1909; 202 and \$14,039,000, in 1914; and 263 and \$42,461,000 in 1919. The manufacturing establishments of Jacksonville increased from 114 in 1909 to 173 in 1914, and 244 in 1919; the value of the product, from \$6,722,000 to \$10,148,000, to \$31,212,000.

Education. Florida has been one of the most progressive of the southern States in the development of the educational system. This has been especially evident since 1892, when the school system of the State was reorganized. Elementary instruction has been greatly extended. Compulsory school attendance, educational campaigns, self-improvement associations, better and more adequate school buildings, grounds, equipment and teachers, and the transportation to and from school of pupils at public

expense, have been among the features that have contributed to progress. The advance made in high school education has been still more noticeable. Provision has been made for more adequate and suitable school plans and the employment of a larger and more efficient teaching staff. Vocational education has been greatly developed in the fields of both industrial and commercial study; and stress has been placed also on instruction in home economics. The Legislature of 1923 passed a teachers' examination certification law, which aimed at improving the grade of teachers employed. The general progress of this period is indicated by a comparison of the figures of enrollment for several years. In 1912-13, the total school enrollment was 164,727; in 1917-18, 196,405; in 1919-20, 225,160. Enrollment in the white schools in 1912-13 was 106,777; 1917-18, 137,826; 1919-20, 157,666. Enrollment in the negro schools in 1912-13 was 57,050; 1917-18, 58,579, and in 1919-20, 67,494. Attendance in the high schools of the State rose from 4264 in 1912-13 to about 8000 in 1921-22. Expenditures for public schools increased from \$2,713,390 in 1912-13 to \$4,837,045 in 1917-18, and to \$7,003,188 in 1919-20. The percentage of illiteracy in the State was diminished from 15.5 in 1910 to 10.9 in 1920. Among the native white population it decreased from 5.7 per cent to 3.7 per cent; among the foreign-born white, from 10.5 per cent to 6.6; and among the colored, from 28.8 to 24.8.

Finance. See STATE FINANCES.

Political and Other Events. During the decade 1914-24, while the State continued Democratic in national elections, in domestic politics there was a serious break in the party alignment which resulted in the defeat, in 1916, of the Democratic candidate for governor. In 1914 elections were held for minor State officers and for United States Senator. Duncan U. Fletcher was the successful candidate for the latter post, and the Democrats were uniformly successful in electing their candidates. No elections were held in 1915. In the election of 1916, when a new Democratic primary law was for the first time put into effect, Sidney J. Catts, candidate on the Prohibition-Independent ticket, defeated W. V. Knott, the Democratic candidate, for governor, and Park Trammell, Democrat, was elected United States Senator. In the presidential election of this year, President Wilson received 55,984 votes and Charles E. Hughes 14,611. A proposed "grandfather clause" amendment to the constitution, designed to prevent Negroes from voting, was defeated at this election, as was also an amendment to reappointment the Legislature. In 1917 the Seminole Indians of the State were for the first time assigned a reservation by the Legislature. They were granted an area of 100,000 acres near the Ten Thousand Islands. In the 1918 elections for Representative in Congress and for minor State officers, the Democrats were uniformly successful. At this election an amendment to the constitution providing for State-wide prohibition was adopted. In the 1920 elections, Cary A. Hardee, Democratic candidate for governor, was successful, and Duncan U. Fletcher was reelected to the Senate; in the presidential election of that year, James M. Cox received 90,515 votes and W. G. Harding 44,853. Alleged peonage in the lumber camps of the State resulted in investigations by grand

COPYRIGHT BY HARRIS & EWING

FERDINAND FOCH

MARSHAL OF FRANCE AND GENERALISSIMO OF THE ALLIED ARMIES IN THE WORLD WAR

juries and other bodies in 1922-23. On Apr. 18, 1923, the Assembly voted to abolish flogging at county convict labor camps, and on April 20 the Senate passed a bill ending the loan of public convicts to private corporations. On April 26 the State Senate, in executive session, ordered the removal of Sheriff J. R. Jones of Leon County, charged with beating prisoners at the county convict camps. On May 14 the Legislature finally ordered the abolition of whipping at the convict labor camps, and this bill was signed by Governor Hardee.

Legislation. The Legislature in Florida meets biennially. Following are among its important accomplishments in the decade 1914-24. In 1915 several measures regulating the liquor traffic were adopted. A special session in 1918 passed measures to enforce the prohibition amendment to the State constitution and also ratified the proposed Federal prohibition amendment. The State tax commission was abolished. The Legislature of 1919 passed a measure providing for the compulsory school attendance of children under 16. In 1921 a tax of \$.01 a gallon was placed on gasoline used in the State, the revenue thus derived to be used for the building and maintenance of State highways. This measure was attacked in the courts. A constitutional amendment to be submitted to the people in 1922 was passed, providing for the reapportionment of legislative representation and increasing the membership of both the Senate and the House; measures were passed substituting electrocution for hanging; the infliction of cruel or inhuman treatment upon inmates of State institutions was forbidden; and a bill was passed to facilitate the coöperative marketing of agricultural products. The Legislature in 1923 adopted a measure declaring that "Darwinism, atheism, and agnosticism" should not be taught in the institutions of the State.

FLORIDA, UNIVERSITY OF. A State institution at Gainesville, Fla., founded in 1905. The student enrollment increased from 349 in the year 1913-14, and 140 in the summer of 1913, to 1287 in the year 1923-24, and 1075 in the summer of 1923, and the faculty was increased from 63 to 76 members. A gymnasium was built in 1919. The auditorium unit of the administration building was under course of construction in 1923-24. It was estimated that this building, when completed, would cost approximately \$750,000. President, Albert Alexander Murphree, LL.D.

FLOTILLA LEADER. See VESSEL, NAVAL.

FLYING BOAT. See AERONAUTICS.

FLYNN, WILLIAM JAMES (1867-). A chief of the United States Secret Service, born in New York, where he was educated at the public schools. He entered the Secret Service Department of the United States government in 1897. In the period 1912-17, he was chief of the Secret Service; in 1918, chief of the Secret Service of the United States railroad administration, and director of the Bureau of Investigation of the Department of Justice, 1919-21.

FOCH, FERDINAND (1851-). Marshal of France and commander-in-chief of the Allies' armies during the War. He was born at Tarbes and was educated at the Catholic College of St. Clément at Metz and at the Ecole Polytechnique. He entered the army and advanced rapidly. As a writer he devoted himself to the science of military tactics; his published works

include *Les Principes de la Guerre, De la Conduite de la Guerre, and Eloge de Napoléon*. He was appointed generalissimo of the Allies' armies by Clemenceau after the American government had asked for a unified command. He drafted the armistice terms which put an end to hostilities between Germany and the Allies on Nov. 11, 1918. After the War he was chosen one of France's forty Immortals and also a member of the Academy of Science. He received the highest honors and an enthusiastic popular welcome on his visit to the United States in 1921. Marshal Foch was married to Mlle Julie Bienvenue. Three children were born of the union, including one son who was killed on the field of battle. See WAR IN EUROPE.

FOG SIGNALS. See LIGHTHOUSES AND RADIO TELEGRAPHY.

FOKKER, ANTHONY H. G. (?-). A Dutch aircraft constructor who has had a great influence on new developments in American airplane construction involving welded steel tubing in fuselage construction. Mr. Fokker built his first all steel fuselage in 1911—built up of steel tube longerons to which are welded vertical and horizontal steel tube struts and which are cross-braced by wires held taut by turnbuckles. One of the newest Fokker planes is a convertible bomber and torpedo dropper. The engine takes up a very small place in the fuselage. The plane has a high speed (115 miles per hour) and carries 5000 pounds. It was built for the Netherlands air force. Argentine and Portuguese world cruisers are of a similar type.

FOLINSBEE, JOHN FULTON (1892-). An American landscape painter born in Buffalo, N. Y., and educated at the Art Students' League in New York and the Woodstock School of Art. He was a pupil of John Carlson, F. V. DuMond and Birge Harrison. He is known especially for his winter landscapes, painted in straightforward impressionistic technique, and is represented in the Corcoran Gallery at Washington, in the Syracuse Museum and in the National Arts Club of New York. His long list of awards includes the Carnegie and J. Francis Murphy prizes from the National Academy of Design in 1921, and the first Hallgarten prize of the National Academy of Design in 1923. He was elected associate of the National Academy of Design in 1919.

FOLK, JOSEPH WINGATE (1869-1923). An American lawyer and public official (see VOL. VIII). From 1914 to 1918 he was chief counsel for the Interstate Commerce Commission.

FOLK PSYCHOLOGY. See SOCIAL PSYCHOLOGY.

FOOD AND NUTRITION. Ideas as to what constitutes a complete food have changed considerably since the early years of the century. The start of this change was perhaps the discovery that proteins are unlike in composition, and that they are complete or incomplete and of good or poor biological value in so far as they do or do not contain in sufficient amounts certain of the amino acids or "building stones" of which they are composed. Fortunately the essential amino acids which must be supplied in the food are few in number, and in an ordinary mixed diet the deficiencies in one protein are compensated by an abundance of the necessary constituents in others. It is essential, however, to bear in mind that all proteins are not of equal nutritive value. In general the

cereal grains contain proteins of lower value than do meat, eggs, and milk, and should not be used as the exclusive source of protein. It is thought by many that the chief cause of pellagra is a deficiency of certain amino acids in the diet in sections of the country where the disease is common. Dietary changes involving only the quality of the protein, such as an increase in milk and fresh meat, have been remarkably successful in preventing and curing pellagra.

Vitamines. The study of the relative nutritive value of the different proteins led to the most important nutritional discovery of the decade 1914-24; in addition to proteins of proper quality and quantity, fats, carbohydrates, and salts, a perfect food must contain a sufficiency of certain substances, as yet unidentified, occurring in natural foods in very small amounts and in a very unstable form as compared with other food constituents. These are the so-called vitamins. Our present knowledge of vitamins comprises the existence of at least three groups, differing in physical, chemical, and physiological properties. Since their chemical constitution has not yet been determined, they are for convenience designated vitamins A, B, and C. Vitamin A is to be found in green leafy vegetables, in milk and butter, in egg yolk, and in animal fats, particularly in liver fat or oil, of which cod liver oil is the best example. It is soluble in fats and fat solvents, it resists saponification, and is comparatively stable to heat except in the presence of oxygen or air. Unlike the other vitamins, a considerable amount of vitamin A can be stored in the body. Consequently the symptoms following its lack are not so quickly manifest. After a short period of deficiency of this vitamin, loss in weight and decreased resistance to infections of different kinds, particularly bronchial and lung trouble, appear. A characteristic eye condition known as xerophthalmia or ophthalmia is apt to develop as the result of extreme deficiency in this vitamin, and for this reason it is sometimes known as the antixerophthalmic vitamin. Closely associated with this vitamin in occurrence and properties is the antirachitic vitamin, or the vitamin which assists in the metabolism of calcium and phosphorus and thus in the prevention of rickets. Certain substances such as cod liver oil and egg yolk appear to be rich in both the antixerophthalmic and antirachitic vitamins; others such as spinach contain the former but not the latter. The chemical property which serves to distinguish it from the antixerophthalmic vitamin is its stability toward oxidation. Cod liver oil which through oxidation has lost its property of curing or preventing ophthalmia retains nevertheless the power of curing rickets. Unlike the other vitamins, the effects produced by it can be duplicated by other measures such as light treatment.

Vitamin B, like vitamin A, may also represent a group of factors rather than a single substance. This group is widely distributed in nature. Whole cereal grains, vegetables (both leafy and root), fruits, milk, and meat contain it in varying amount, but it is absent from highly refined cereal products, fats, sugars, and starches. It is soluble in water, in alcohol up to fairly concentrated solution, and in various organic solvents. It is comparatively stable to heat, but less stable in alkaline than in acid or neutral solution. It is less affected

by oxygen than the other two groups. The term vitamin B includes the antineuritic vitamin, which prevents polyneuritis in pigeons and beriberi in man, and the so-called water-soluble, growth-promoting vitamin. The most characteristic and earliest symptom resulting from lack of vitamin B is loss of appetite. This is followed by lowering of body temperature, rapid loss in weight and finally loss of motor control and symptoms of paralysis. An insufficiency of this vitamin is thought to be responsible for gastro-intestinal disturbances of various kinds and weakened resistance to infection. The latter is attributed by some to the lowered body temperature.

Vitamin C, or the antiscorbutic vitamin, is found chiefly in fresh fruits, particularly citrus fruits, in sprouted grains, and in certain vegetables, both leafy and root. Oranges and tomatoes are the most commonly used sources of this vitamin. It is the least stable of the three and is easily destroyed by heat, particularly in the presence of oxygen. In acid medium it is less easily destroyed than in alkaline. Lack of this vitamin results in the well-known symptoms of scurvy. An insufficiency not great enough to cause signs of scurvy causes a weakened resistance to infection, and in children irritability, a general lack of stamina, and retardation of growth. In addition to these three groups of vitamins, investigation up to 1924 had obtained evidence of another rather more limited in its scope. This was known as vitamin X, necessary for successful reproduction. Present evidence points to its presence in certain leafy vegetables such as lettuce, in cereal grains, and in meat. Abundant proof of the necessity of these vitamins in human nutrition was afforded by the result of restriction and limitations in the food supply of the world during and after the War. Perhaps the most striking illustration of the effect of lack of vitamin A is to be found in the incidence in almost epidemic form of eye trouble resulting in blindness among the children of Denmark in the early years of the War, when, through large exportations of butter, only skim milk was available. Shortly after the blockade, when butter could no longer be exported and whole milk and butter became available, the trouble disappeared, only to turn, though less malignantly, when the export trade was renewed. Cases of eye trouble and blindness probably attributable to lack of vitamin A are of common occurrence even in the United States.

A striking illustration of the direct connection between diet and the deficiency diseases, beriberi and scurvy, was afforded by the development during the siege of Kut-el-Amara in Mesopotamia of beriberi among the English troops and scurvy among the Indian troops in the same garrison. The English were protected from scurvy by large quantities of fresh meat (horse and mule) which the Indians, through religious and other scruples, refused to eat. The Indians on the other hand were protected from beriberi by the coarse whole-grain bread included in their ration in place of the white bread of the English ration. The effects of vitamin insufficiency are to be seen in the deplorable state of undernutrition and weakened resistance to infection in the great mass of European children during and since the War. An interesting opportunity to apply the experimental methods of the laboratory to human

nutrition was afforded a group of English scientists, headed by Dr. Harriet Chick, who in certain wards of the university Kinderklinik in Vienna, undertook to build up the undernourished children by systematic vitamine feeding. With the same diet as that furnished in other wards, ample in its calorific-protein supply, the addition of orange juice and cod liver oil wrought such prompt and beneficial changes as to convert those who were most skeptical of vitamine theories.

In the United States the increasing evidence of minor symptoms, particularly lack of stamina, a tendency to digestive disturbances, and a lowered resistance to infection, resulting from an insufficiency of vitamins, makes their consideration a matter of great importance. There is no evidence that excess of any of the vitamins is harmful, and since the absolute requirement for human nutrition is as yet unknown and any excess of vitamine A is kept in reserve for future use, it is well at all times to furnish an abundance of vitamine-containing foods, particularly of those rich in vitamine A. In this respect milk is an ideal food. It contains an appreciable amount of vitamine C, is a fairly good source of vitamine B, and an excellent source of vitamine A, and is furthermore the best source of calcium for growing children. Plenty of milk and an abundance of green vegetables and fruits will insure an adequate supply of all three vitamins. See also VITAMINE OR VITAMINES.

No less striking than vitamins in respect to the small amount necessary to turn the balance from failure to success in nutrition is iodine. The incidence of goitre (q.v.) in certain sections of the United States and Europe is now attributed to the lack of iodine in the water and natural foods, particularly the former. A remarkable success has been obtained, in districts where goitre is endemic, by the administration of iodine compounds for very brief periods during the year. In certain places an attempt is being made to furnish the necessary iodine by adding it to the water supply.

A recent scientific achievement which has an important bearing on nutrition is the successful separation from the pancreas of insulin, the substance which controls directly or indirectly the metabolism of carbohydrates in the body. To the physician this discovery is of significance in offering the means of keeping under subjection the troublesome disease, diabetes; to the physiological chemist the centre of interest is the light which experimentation with it may throw on the mysteries of the intermediary metabolism of carbohydrates and fats; to the nutrition worker and dietitian it opens up a wide field in the calculation of diets, for in the insulin treatment of diabetes, dietary control is of even greater importance, and mistakes are of more direful consequence, than when insulin is not used. In connection with diabetes the successful preparation of an odd-carbon fat, intarvine, which can be safely oxidized by the diabetic organism, should be mentioned as an important recent contribution.

In the rationing of the armies and in the system of rationing of the entire civil population of the allied countries, proposed shortly before the close of the War, the energy requirement served as the basis. The consensus of scientific opinion regarding food requirements may be seen from the decision of the Inter-

Allied Scientific Food Commission concerning the apportionment of the food supplies of the Allies. The Commission decided to use as the basic standard for the food requirement of each nation the quantity of food which would be taken by an average man. The proper diet of the average man was fixed as furnishing 3000 calories "as utilized," or, allowing for waste, 3300 calories as purchased, and 75 grams (about three ounces) of fat daily. It is of interest that a minimum of fat rather than of protein was specified. The commission decided that meat was not a physiological necessity, especially when milk, cheese, and eggs were available in addition to vegetable protein. In estimating the relative needs of food according to age and sex, the following percentages of the requirement per man were used: up to six years of age, 50 per cent; from six to 10, 70, from 10 to 14, 83; 14 and over (women), 83, and men, 100. These values are based upon the more recent studies which have emphasized the relatively high food requirements of growing children.

Increasing attention is being given, particularly in the United States, to the nutrition of school children. Various indices of nutrition have been proposed and are being used to determine the extent of malnutrition. Among these standards are the Wood standard of height and weight for age, the Dreyer standard based on trunk length and chest circumference, and the Pirquet pelvisi standard. These standards, while not infallible, serve to indicate roughly the nutritional status of the child, and considerable success has been attained in correcting malnutrition, as thus detected, by supplementary feeding. 1924 saw only the beginning of this work, for which much was to be expected.

FOOD BOARD. See UNITED STATES, History.

FOOT-AND-MOUTH DISEASE. See VETERINARY MEDICINE.

FOOTBALL. This branch of sports comprises several different games such as college

football as played in the United States, Rugby, association and soccer. Rugby, association and soccer football are chiefly confined to the British Isles and Europe although soccer, following the close of the World War, has gained steadily in popularity in the United States, particularly the mid-West and along the Atlantic seaboard. Some of the Pacific Coast universities have organized Rugby teams in recent years but this type of football has failed to arouse much interest in the American public.

The regular college game of football vies with baseball in popularity in the United States, contests between prominent elevens attracting as many as 80,000 spectators. Within the last few years all the larger American universities have been obliged either to increase the seating capacity of their stadiums or build larger ones to meet the constantly growing demand for seats.

The mammoth Yale Bowl, the Harvard Stadium, Palmer Field at Princeton and the Ohio State University Stadium with accommodations for from 40,000 to 80,000 spectators were all constructed during the period 1914-24.

Unlike professional baseball there is no way of determining which college eleven deserves first ranking each year. No contests for the championship are played, the schedules of the various colleges being restricted to not more than ten games each season. All attempts to hold post-season contests in an endeavor to decide superiority have in the past been frowned upon by the authorities of the colleges concerned.

The ten years ending with 1924 were marked by a larger number of intersectional college games than formerly and this fact enabled the students of football to compare and appraise the coaching methods and types of play in vogue in various parts of the country. The critics generally agree that whereas the more open style of game is played by the universities of the Middle West, the all-round strength of teams there averages no higher than in the eastern States or on the Pacific Coast.

Few changes in the playing rules of the college game have been made since the introduction of the forward pass and the elimination of mass formations. The present game appears to give satisfaction and to its development year by year is undoubtedly due the wonderful popularity college football is enjoying.

Professional football has gained a foothold in certain cities of the Middle West, the elevens being recruited from former college players. The university authorities, however, are doing everything possible to discourage this movement and attempts to arouse the interest of the public in games between professional teams have generally been unsuccessful.

Soccer, both professional and amateur, is making considerable headway in the United States. The American Soccer League (professional) has clubs in Greater New York (three), Newark, Philadelphia, Bethlehem, Fall River and Providence. St. Louis, Chicago and Baltimore also are leading soccer centres with both professional and amateur clubs playing regularly arranged schedules. Many former star players on various English and Scotch league elevens have appeared in American soccer line-ups in recent years.

FORAIN, JEAN LOUIS (1852-). A French caricaturist, etcher, and painter (see Vol. VIII). During the War, his weekly car-

toons in *L'Opinion* were notable. Later he executed an important series of etchings on war subjects. In 1923 he was elected to the French Academy. Although most widely known as a penetrating illustrator of French manners, in which capacity he continued to contribute to numerous periodicals, as an etcher he was styled incomparable, and his work in painting was delicate and delightful. Additional works that may be mentioned are *Vous, vous, eux; La Vie; and De la Marne au Rhin*.

FORAKER, JOSEPH BENSON (1846-1917). An American Republican politician and legislator (see Vol. VIII). He was defeated by President Harding in the Republican primaries for a seat in the Senate in 1914. A year before his death he published *Notes on a Busy Life*.

FORBES, JOHN (?-). A playwright, born at Salem, Ont. He came to the United States in 1884 and was successively dramatic critic, editor, and press representative. He organized and directed the formation of groups of professionals sent to Europe to entertain the American Expeditionary Forces during the War, organized the first stock company of actors to play in repertoire in France, and originated the plan of organizing other actors who were serving in the army into stock companies. His most recent plays include *The Commuters; The Travelling Salesman; The Show Shop; and The Famous Mrs. Fair* (1919).

FORBES, WILLIAM CAMERON (1870-). An American public official (see Vol. IX), who was appointed by President Harding to the Wood-Forbes mission to investigate conditions in the Philippine Islands in 1921. He was overseer at Harvard, 1914-20. In June, 1923, he was elected honorary president of the China Society of America.

FORD, GEORGE BURDETT (1879-). An American architect and specialist in city planning, born at Clinton, Mass., and educated at the Massachusetts Institute of Technology and the Ecole des Beaux-Arts in Paris. He began practice in Boston in 1901, afterward continuing in New York City. As a specialist in city planning he was consultant, at various times, for New York City, Passaic, Jersey City; Omaha, Neb.; Springfield, Mass.; Cincinnati; Mansfield, Ohio, and many other cities. In France he was consultant to the French government for the reconstruction of cities in the devastated regions.

FORD, HENRY (1863-). An American manufacturer (see Vol. IX). In December of 1915 he chartered a ship to send a party of peace enthusiasts to Europe with the object of organizing a conference to influence the belligerent governments to cease warfare. The party went to Christiania, Norway, and thence some members proceeded to Stockholm, Copenhagen, and The Hague, but the entire movement ended unsatisfactorily; it was not officially recognized abroad, and dissension arose in the ranks of the members themselves. Mr. Ford was a Democratic candidate for the United States Senate in 1918. In 1916 he brought a libel suit against the *Chicago Tribune* for \$1,000,000, because he had been called an anarchist in one of its editorials. The court awarded him a verdict of \$06 and the cost of the trial. A controversy arose in 1918 over the results of the senatorial election between Truman H. Newberry, Republican, and Mr. Ford, Democrat.

Ford charged his Republican opponent with excessive expenditure in his campaign. Newberry was charged and convicted, but on appeal to the Supreme Court, the decision was reversed in January, 1922. Mr Ford resigned as president of the Ford Motor Company in 1920 and was succeeded by his son. About the same time he bought the *Dearborn* (Mich.) *Independent*, in which from time to time he severely criticized the Jews. See MUSCLE SHOALS.

FORD, HENRY JONES (1851-1925). An American journalist and professor of politics (see VOL. IX). In 1920-21 he was a member of the Interstate Commerce Commission. He published *The Scotch-Irish in America* (1915), *The Natural History of the State* (1915), *Woodrow Wilson, the Man and His Work* (1916), *Washington and His Colleagues* (1918), and *The Cleveland Era* (1919).

FORD, JAMES LAUREN (1854-). An American humorist (see VOL. IX). He wrote *Waitful Watching* (1916) and *Forty Odd Years in the Literary Shops* (1921) and edited *The Porcupine*, 1917-18.

FORD, WALTER BURTON (1874-). An American mathematician, born at Oneonta, N. Y. He graduated from Harvard in 1908 and took post graduate courses at that university and in Europe. From 1900 to 1903 he was instructor of mathematics at the University of Michigan, and from 1904-5 at Williams College. From the latter date he was again a member of the faculty of the University of Michigan, serving as professor of mathematics until 1917. He was a member of several scientific societies and wrote *Plane and Solid Geometry*, 1913; *First Course and Second Course in Algebra*, 1919.

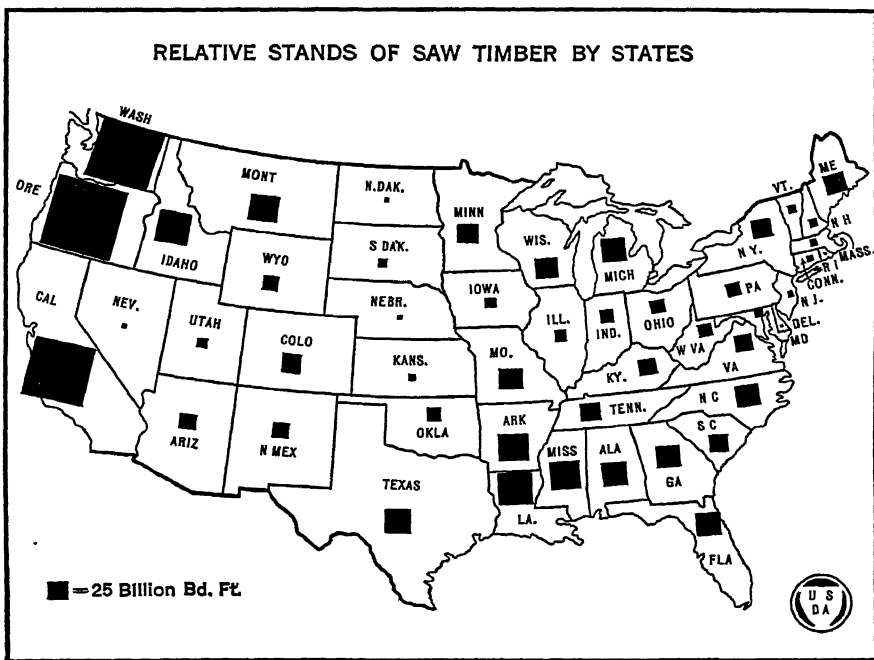

He also contributed various articles to scientific journals.

FORDHAM UNIVERSITY. A Roman Catholic institution at Fordham, New York City, founded in 1841. It is under the Society of Jesus and is the largest Roman Catholic institution in America. Fordham increased its student enrollment from 1500 in 1913-14 to 4866 in 1923-24 plus 500 in the summer school of 1923; increased its faculty from 140 to 190, and its library from 72,700 to 115,000 volumes and 38,000 pamphlets. In 1924 it claimed the largest law school in the United States with a student body of 1442 plus 140 pre-law students. A gymnasium was built in 1923, and a new library building was to be erected in the spring of 1924. Thomas J. McClusky, S.J., who was president in 1914, was succeeded in 1915 by J. A. Mulry, S.J., who held office until 1918, when E. P. Tivnan, S.J., Ph.D., became president.

AND BANKING.

FORESTRY. In no single equal period of the world's history were the forest resources of the world so heavily drawn upon as in the decade 1914-24. Not only the needs of ordinary population growth but the enormous demands of war caused an unprecedented use of lumber, especially the very finest grades. The seriousness of the situation in the United States was indicated in the 1921 report of the Chief Forester, who stated that three-fifths of the virgin timber was gone, and, worse yet, the people were using the remainder at a rate four times that of production. The one redeeming feature of

(From U. S. Department of Agriculture, "Timber Mine or Crop?" 1922.)

Most of the remaining timber in the United States is in the South and West, far away from the great industrial and farming States of the Middle West and Northeast, where the need for timber is greatest. Destructive lumbering has greatly reduced the forests of this region. One of the most urgent economic problems is reforestation—the growing of timber on the immense areas of rough land best suited for forests.

the situation was the growing realization throughout the civilized world at large and in the United States in particular that forest resources must be strengthened, restored, and conserved in every possible manner. The War clearly showed how vital the forests are to a nation's existence. Without the systematically managed forests of France the successful prosecution of the War might have been grievously delayed. Likewise, it was equally true that the forests of Germany enabled that nation, surrounded as it was by blockading fleets and armies, successfully to endure much longer than it could have without them. One of the peculiar results of the War in relation to forestry was the shutting off for a time of the vast Russian timber supplies from the nations of western Europe. English forests suffered severely during the War. It is roughly estimated that over 1,000,000 acres of private woodlands were cut down for war needs.

Lumber. Despite the stimulus of war, there has been a consistent decrease in lumber production in the United States since 1906, when a maximum of 46,000,000,000 board feet was reached. This decline in the face of rapidly increasing population meant a drop in per capita consumption from 500 board feet in 1906 to 320 board feet in 1920. Taken in connection with a rapid westward movement of the source of supplies, resulting in ever increasing transportation costs, the lumber situation became increasingly serious. In an effort to reduce waste resulting from the use of a multiplicity of grades and sizes, a committee on lumber standardization, representing the lumber trade and similar committees from the United States Departments of Agriculture and Commerce, proposed in 1923, as the result of joint studies, a series of standard grades for yard lumber and structural timber of all important species. The United States Forester repeatedly warned the people of the country of the decreasing supply and urged that efforts be made to stimulate timber production in the United States.

Reproduction. The decade ended 1923 saw considerable expansion in forest planting throughout the world. England, suffering from the loss of 1,000,000 acres of woodland during the War, began actively planting on a large scale and establishing forest nurseries in various parts of England and Scotland. In the United States not only the Federal government but many States and municipalities saw the wisdom of encouraging forest planting, and many private corporations in Canada and the United States engaged in various forms of lumber operation began planting on a large scale. New York State developed nurseries having an annual capacity of 15,000,000 trees. Pennsylvania distributed trees to private owners at the rate of 4,000,000 per annum.

National Forests. The area of the national forests showed a net decrease approximating 7,000,000 acres from June 30, 1914, to June 30, 1923, a loss explained in part by the consolidation of small areas and by the release of lands adapted primarily to agriculture. That the national forests are an important source of income to the Federal government was shown by an aggregate income, during the year ending June 30, 1923, of more than \$5,000,000. The value of the forests as recreation places for the people is beyond calculation. It was estimated that four-fifths of the forest land of the United

States was privately owned, and that, since it is subject to no constructive programme, it may become a national liability rather than an asset.

Pulpwood. The enormous use of wood for the manufacture of paper and paper products constituted a very serious drain on the nation's timber resources. In the year 1920 alone over 6,000,000 cords of pulpwood were used in the United States, of which over 1,000,000 were imported from Canada. Canadian alarm at the increase in pulpwood exports to the United States was manifested by the authorization in 1923 of the Government in Council to place an embargo on the export of pulpwood from privately owned lands in the Dominion. In expectation of future shortages, the United States Department of Agriculture Forest Service studied the possibility of growing more pulpwood and also of utilizing species which hitherto had been considered useless. The discovery by the Forest Products Laboratory at Madison, Wis., of methods of de-inking print paper was expected to result in the use of vast quantities of waste material. See PAPER AND WOOD PULP.

Alaska's Forest Resources. The decline in the forest resources of the mainland of the United States created interest in other possible sources of supply, notably Alaska. A popular opinion of the vastness of the Alaskan forests was dispelled by the 1921 report of the United States Forester, which stated that the national forests of that territory comprise 20,000,000 acres, containing an estimated stand of 75,000,000,000 board feet of usable timber, a quantity which, though large in itself, would not long supply the nation's needs, for production in the United States in the year 1923, for example, attained the enormous quantity of 32,000,000,000 board feet. In that the national forests of Alaska represent 85 per cent of the Territory's lumber supply, it may be readily seen that they are not inexhaustible. In order to encourage the rational use of Alaskan timber, the Federal Forest Service offered inducements to reliable corporations to establish pulp mills in the national forests, on a basis of permanent production. It was estimated that the Tongass Forest alone could thus supply an annual yield of print paper equal to one-third of the present United States consumption. The effort of Secretary Fall to obtain the transfer of the Alaskan forests from the Department of Agriculture to the Department of the Interior created considerable excitement, but no such action was taken. Alaska's cause gained much from the whole-hearted indorsement of conservation policies by President Harding following his return from the ill-fated tour of inspection.

Forest Experiment Stations. Under the stimulus imparted by the consciousness of the rapidly diminishing forests, research received greater consideration during the period subsequent to the War, especially in the eastern United States, where the pinch of high priced lumber was most severely felt. That there was a significant awakening was concretely manifested in the establishment of four new Federal forestry stations: (1) Southern, New Orleans, La., 1922; (2) Appalachian, Ashville, N. C., 1922; (3) Northeastern, Amherst, Mass., 1923; and (4) Lake States, St. Paul, Minn., 1923. In opening stations in the large timber producing sections of the East, the purpose of the United States Department of Agriculture For-

est Service was to determine the best silvicultural practices for each of the regions served and in the Lake States to encourage the reforestation of vast cut-over lands now idle, which only a few decades ago were covered with a splendid growth of white pine.

Forest Fires. Fire, long conceded to be the greatest enemy of the forests, continued during this period to exact its toll not only of timber but also of human life. Conspicuous among the serious fires was that of the fall of 1918 in northern Minnesota, where hundreds of square miles of forests, many towns, and several hundred lives were lost, and the 1923 California fire, which destroyed a large part of the city of Berkeley. Consistent and effective work on the part of newspapers and periodicals in directing attention to the fearful results of forest fires did much to present to the general public the seriousness of the situation and to warn tourists and hunters of the danger of careless practices. The first national fire conference ever held in the United States was convened at Sacramento, Cal., during the summer of 1921. All aspects of forest fire control were discussed. Serious attempts made by both the Canadian and the United States governments to utilize the airplane as a means of controlling forest fires pointed to the probability that airplanes would be most effective in detecting rather than in subduing forest fires. The Weeks Law, providing \$100,000 Federal funds annually to assist the States in fighting forest fires, aided materially in the reduction of loss. It was generally conceded by expert foresters that fire control is really the most vital factor in forestry, since all efforts in replanting and improvement are canceled by failure to suppress fires. The average loss in the United States for the six years ending with 1923 was 7,000,000 acres of burned-over land per annum. The value of effective fire protection was demonstrated in western Washington when, despite the destruction of 6,000,000,000 board feet of timber by a tornado which swept the west side of the Olympic Peninsula on Jan. 29, 1921, no fire losses were reported from the tangled mass of highly inflammable material.

Insects and Disease. Not fire alone, but insects and diseases exacted a heavy toll from the forests of the United States and of all the world during the decade. Perhaps the most insidious enemy of all was the chestnut blight, which, gaining a foothold on the Atlantic coast of the United States, practically eliminated the chestnut from the eastern United States forests. The white pine blister rust, long an enemy of the white pine forests of the eastern United States, became established in the western white pine forests of British Columbia and Washington. The gipsy and brown-tail moths continued their slow but consistent spread throughout New England. The tremendous areas involved in forest pest control rendered suppressive measures exceedingly difficult.

Land Classification. The agricultural depression following the War forced the attention of thinking agriculturists, foresters, and business men to the considerable amount of land in the United States which, though utilized for agriculture, was for the time being of essentially greater value for the growing of forest trees. The Secretary of Agriculture named a committee to classify the lands of the United States according to their probable value, in the

effort to prevent the vain and futile attempts of pioneers to establish homesteads on land primarily unfitted for agriculture.

Miscellaneous. The organization in 1920 of the British Empire Forestry Association, connecting all the scattered forest units of the vast Empire, was a very important step. Two conferences, one held in London, England, in 1920 and the other in Ottawa, Canada, in 1923, did much to cement together the forestry interests of the British Empire. In addition, the publication of a quarterly journal by the association, the first number of which appeared in March, 1922, promoted friendly relations between the various units of the service. The *Journal of Forestry*, published by the American Association of Foresters, continued to develop as an important medium for the exchange of thought and knowledge on American forestry problems. The Yale Forestry School held its second decennial reunion in December, 1920, bringing to mind that scientific forestry in the United States is of comparatively recent origin.

Necrology. Of various prominent foresters who died during the decade may be mentioned Bernard Fernow, Feb. 26, 1923, first Forester of the United States and at the time of his death dean emeritus of the School of Forestry of Toronto University; J. T. Rothrock, June 2, 1922, affectionately known as the father of forestry in Pennsylvania; and Arnold Engler, 1923, director of the Swiss Forestry Experiment Stations.

Bibliography. The growth of scientific forestry in the United States was indicated by the appearance of an unusual number of books relating to fundamental subjects. The more significant are: F. Roth, *Michigan Manual of Forestry*, 2 vols., (Ann Arbor, Mich., 1914 and 1916); H. H. Chapman, *Forest Valuation* (New York, 1915); J. W. Toumey, *Seeding and Planting* (New York, 1916); R. C. Hawley and A. F. Hawes, *Manual of Forestry for the Northeastern United States* (New York, 1918); H. H. Chapman, *Forest Mensuration* (New York and London, 1921); K. W. Woodward, *The Valuation of American Timberlands* (New York and London, 1921); R. Zon and W. N. Sparhawk, *The Forest Resources of the World* (New York and London, 1923).

FORMAN, HENRY JAMES (1879-). An American author and editor. He was educated at Harvard and at the Ecole des Hautes Etudes Sociales, Paris. He was attached to President Roosevelt at the Russo-Japanese Conference as a special correspondent. Earlier in his career he was literary editor of *Appleton's Magazine* and political editor of the *Literary Digest* (1905-06), associate editor and general manager of the *North American Review* (1906-10), a member of the editorial staff of *Collier's Weekly* (1913-14), its managing editor (1914-18), and United States propaganda agent abroad (1917). His works include *In the Footprints of Heine* (1910), *The Ideal Italian Tour* (1911), *London—An Intimate Picture* (1913), *The Captain of His Soul* (1914), *Fire of Youth* (1920), and *The Man Who Lived in a Shoe* (1922).

FORMOSA, or TAIWAN. An island in the western Pacific, belonging to Japan; area, 13,839 square miles; population, in 1920, 3,654,398 as compared with 3,341,217 in 1910. The Japanese increased from 50,000 to 153,330. The great mass of the population thus remained Chinese.

The chief town, Taiboku, had 162,782 inhabitants in 1920 as against 95,000 in 1910.

Industry and Trade. Rice production showed consistent advances, its yield (two crops) in 1922 being 27,434,900 bushels as compared with 25,526,500 in 1913. Sugar, which engaged 60 mills on the island, and tea, jute, and sweet potatoes, similarly were on the increase. The production of camphor, though a government monopoly, failed to maintain the progress shown during 1904-12, for the yield fell from 7,077,100 pounds in 1912 to 2,933,333 pounds in 1919-20. A greater application to the natural resources showed itself in increased returns from mining. The total value of minerals, principally coal, gold, copper and silver, was 11,167,426 yen in 1919; in 1913, it was 4,015,102 yen. Japan continued to absorb the greater part of the Formosa trade, though China and the United States occupied fairly important positions. Discounting the unfavorable years of the War, the advance was consistent. In 1914, imports from foreign countries totaled 13,013,937 yen and from Japan, 39,879,148 yen; in 1921, imports from foreign countries were 40,433,290 yen and from Japan 93,521,168 yen. Similarly exports showed: 1914, to foreign countries 12,982,314 yen, to Japan 45,738,116 yen; 1921, to foreign countries 23,541,621 yen, to Japan 128,896,879 yen. Thus the favorable balance was 5,827,345 yen in 1914 and 18,484,042 yen in 1921. Means of inland communication were pushed. Railroad mileage increased from 290 miles in 1913-14 to 369 miles in 1920-21.

Government and History. Under Japanese administration, the island's welfare improved materially. From the point of view of civil liberties, however, it must be recorded that the government remained absolute. The cost of administration mounted over the period. In 1913-14, expenditures were 44,473,781 yen; in 1922-23 (estimate) 106,002,034. Receipts were derived from inland taxes, customs, public undertakings, and Japanese subsidies (from 5,000,000 to 9,000,000 yen annually). Monopolies were maintained over camphor, salt, tobacco, opium, sake, and other spirits. As a result of this action, the use of opium gratifyingly fell off, and the number of licensed smokers declined from 169,064 in 1900 to 44,922 at the end of 1920.

FÖRSTER, FRIEDRICH W. (1869-). A German pacifist and social philosopher, born at Berlin. He studied philosophy, sociology, and political economy at the universities of Berlin and Freiburg. After teaching philosophy at the Zurich Polytechnikum, he became in 1912 professor of philosophy at the University of Munich. He resigned his chair in 1920 and retired to Switzerland. Unlike the famous 93 professors, Förster opposed the German government's policy all through the War. After the Armistice, he became one of the spiritual leaders of the new Germany. In the manner of the idealistic philosophers of classical Germany, he published an appeal to the people's conscience, an appeal which though without immediate practical results yet carried the prophetic conviction of the future. In his *World Politics and World Conscience* (*Weltpolitik und Weltgewissen*, 1919), he made a penetrating attack on the militaristic policy which Germany had followed since 1870. He pleaded for the return to pacific federalism, and urged Germany not to sow dissension among

her late enemies but to strive disinterestedly for the creation of a European conscience. Förster's outspoken stand against the old order earned for him the enmity of a large fraction of the professorate; it was for that reason that he retired to the neutral haven of Switzerland. He published there an autobiographical account of his long struggle with German militarism (*Mein Kampf gegen das Militarismus Deutschlands*, 1920). Förster's other works include *Technik und Ethik* (1905); *Schule und Charakter* (1907); *Sexualethik und Sexualpädagogik* (1907; English translation, *Christianity and Sex*, 1908); *Christentum und Klassenkampf* (1908); *Autorität und Freiheit* (1910); *Schuld und Sühne* (1911); *Politische Ethik und Politische Pädagogik* (1919); and *Christentum und Pädagogik* (1920).

FORSTER, HELENE VON (1859-1924). A prominent Bavarian welfare worker. She investigated child mortality, studied the occupational problems of women, and was instrumental in carrying on reforms. She was a member of the municipal council of Nuremberg.

FORT, PAUL (1872-). A French poet styled since 1912 "the prince of poets," who in many ways continued the tradition of the symbolist school of the 1880's and 1890's. On the publication of his *Ballades Françaises* he was hailed by Rémy de Gourmont as "the most curious figure of the second generation of symbolists" and one whose talent was "a manner of thinking as well as a manner of expression." His verse style reflects this peculiarity; it is a sort of rhythmic prose without any of the ordinary transpositions. The author's justification for this is that it enables his thought to pass freely from prose to poetry without the usual barriers. Fort was honored officially by a ribbon of the Legion of Honor but otherwise obtained neither the reputation nor the public which eminent critics believe he deserved. His works include *Ballades Françaises*; *Montagnes, Forêts, Planes, Mers*; *Le Roman de Louis XV*; *Les Idylles Antiques*; *L'Amour Marin*, *Les Nocturnes*; *Visions Romantiques*; *Réponse de l'Aube et de la Nuit*; *Coconbe, ou l'Homme tout Nu Tombé du Paradis*, and *Vivre en Dieu*.

FORT WORTH. A city of Texas. The population rose from 73,312 in 1910 to 111,536 in 1920 and to 143,821 by estimate of the Bureau of the Census for 1923. A filtration plant was built and the dam across the Trinity River, begun in 1913, was completed during the decade; on the lake so formed a municipal bathing beach was opened in 1917. During the War, Camp Bowie and three flying fields were built close to the city. Shortly afterwards the discovery of oil fields near-by brought the headquarters of the big production companies and a boom to the city, so that by 1924 the petroleum products turned out by the nine refineries in the city were valued at \$52,000,000 annually. The United States helium gas plant was established at Fort Worth, costing, up to 1924, \$5,000,000, and the city was named one of the four stations for dirigible airships. In 1919, building permits reached nearly \$19,000,000. Several large office skyscrapers and many minor buildings were erected: in the area that had been Camp Bowie, 3500 houses were built. The area of the city was considerably enlarged by the annexation of closely built up territory at the outskirts of the city.

FORTY-EIGHT, COMMITTEE OF. An organi-

zation founded for the purpose of establishing a new national Liberal or Progressive party, which held its first national conference at St. Louis in 1919. Its platform called for the abolition of special privilege, through public ownership of the railroads, public control of natural resources, public control of money and credit through government and cooperative banks, preservation of all civil rights guaranteed by the constitution, and the prevention of judicial abuses. The Committee played an active part in the Congressional elections of 1922, and formed a new party in Idaho, Nebraska, Pennsylvania, Delaware, and North Dakota, in addition to the party already established in South Dakota and Minnesota. In 1924 it broke with the National Farmer-Labor-Progressive Convention held at St. Paul to nominate a candidate for president, because communists were to be seated as delegates, and threw its entire support to the Convention of the Conference for Progressive Political Action held at Cleveland July 4, and recommended to its affiliated bodies that they take similar action. A regular press service was initiated in 1920 which in 1924 served 500 or 600 newspapers, periodicals and magazines. The monthly organ of the Committee, *The Liberal*, which was founded in 1921, was sent to all members. Five pamphlets were published in 1923 for the information of the voters.

FOSDICK, HARRY EMERSON (1878-). An American clergyman and professor, born at Buffalo, N. Y., and educated at Colgate University, Union Theological Seminary, and Columbia University. He was ordained to the Baptist ministry in 1903, holding a pastorate at Montclair, N. J., until 1915, when he was named professor of practical theology in the Union Theological Seminary, in New York City. His works include *The Manhood of the Master* (1913); *The Assurance of Immortality* (1913); *The Meaning of Prayer* (1915); *The Challenge of the Present Crisis* (1917); *The Meaning of Faith* (1917); *The Meaning of Service* (1920); *Christianity and Progress* (1922); a Spanish translation of one of his books, as *La Personalidad del Divino Maestro* (1923); and *Twelve Tests of Character* (1924).

FOSTER, BEN (JAMIN) (1852-1926). An American landscape painter (see VOL. IX). In his later works, among which may be mentioned "Late Summer Moonrise," "Litchfield Hills," "Hazy Moonrise," and "From Hill to Hill," his interest in the misty effects of dawn and twilight and moonlit nights was still conspicuous. In 1917 he was awarded the Altman prize, National Academy of Design, and the gold medal and prize, National Arts Club.

FOSTER, SIR GEORGE EULAS (1847-). A Canadian statesman (see VOL. IX). In 1914 he was a representative of the British Government at the Economic Conference in Paris. After the Armistice he was Canadian representative at the Peace Conference (1919) and later Vice-President of the League of Nations.

FOSTER, JEANNE ROBERT (Mrs. MATLOCK FOSTER) (1884-). An American editor and author, born at Johnsburgh, N. Y., and educated at Boston University, in Harvard courses, and the Stanhope-Wheatcroft Dramatic School in New York. In 1910, after various newspaper experience, she identified herself with the *Review of Reviews* and later became editor of its literary department. Her works

include *Wild Apples* (1916), *Neighbors of Yesterday* (1916), and *Rockflower* (1922); all of these are poetry.

FOSTER, MAXIMILIAN (1872-). An American author born in San Francisco and educated at Andover Academy (Mass.). His career started in the newspaper field, which he abandoned for magazine work. Since 1902 he has published several plays and novels, which include *Keeping Up Appearances* (1911), *The Whistling Man* (1913), *The Trap* (1920), *The Silent Partner* (1923), and others. During the War he was official correspondent for the United States government in France.

FOSTER, WILLIAM TRUFANT (1879-). An American educator (see VOL. IX). He resigned from the presidency of Reed College in 1920 and accepted the directorship of the Francis D. Pollak Foundation for Economic Research (1920-). He wrote *Should Students Study?* (1917). In 1923 he wrote *Money*, on the gold policy for the United States, with Waddill Catchings.

FOUGNER, G. SELMER (1884-). An American journalist, born in Chicago, Ill. He was educated at the Sorbonne, Paris, and began his newspaper career as a member of the editorial staff of the *Paris Herald* (1906-09). He was later with the *New York Press* (1909-12), the *New York Sun* (1912-17), correspondent at the mediation conference between the United States and Mexico (Niagara Falls, 1914), London correspondent for the *New York Sun* (1915), manager of the Press Bureau of New York for the Liberty Loans (United States Treasury, 1917-20), director of newspaper publicity for the second, third, fourth and fifth loans, and for many organizations and committees of the War. He also edited *Paper*, *The Publisher's Guide*, and *L'Exportateur Américain*.

FOULKE, WILLIAM DUDLEY (1848-). An American civil service reformer (see VOL. IX). In September, 1923, he was head of a delegation which visited President Coolidge and urged reform of the methods of appointing postmasters. In 1923 he was elected president of the National Civil Service Reform League.

FOULIS, BENJAMIN DELAHAY (1879-). An American army officer, born in Connecticut. He enlisted in the army as private and in 1901 was commissioned 2d lieutenant. He became 1st lieutenant in the Signal Corps in 1908, and in 1914 was appointed captain of the Aviation Section of that corps. From that time he was constantly on aviation duty and was the senior military aviator in the point of service. He commanded the air service troops on the Mexican border in 1916-17 and in 1917-18 was Chief of the Air Service, A. E. F. He was the American member of the Aviation Committee of the Supreme War Council from 1917 to 1919, and from 1920 was assistant military observer for the American Commission at Berlin, Germany. He was promoted to be brigadier-general in the Service Corps in 1917.

FOUNDATIONS. The interval between 1914 and 1924 did not witness striking developments in the method of constructing foundations though there were naturally many improvements in the organization and execution of the work, due to better appliances and incidental improvements. The tendency more freely to employ steel and concrete piles in a large measure replaced wooden piles, while steel inter-

locking sheet piling was found more useful than timber sheeting. In foundation construction reinforced concrete had become an indispensable construction material as it was able to withstand tension more than granite masonry or timber. The foundation work of the most important character naturally had to do with large office or public buildings, such as hotels. State or municipal buildings, opera houses or similar structures, and foundations for bridge piers where it was necessary to build these either in the stream or in lowland.

In modern building construction the foundation not only supported the skeleton steel frame which with modern construction was constantly increasing in height, but also had to be considered in connection with the increased space in the basement and cellars for machinery for other purposes. As a result there were involved not merely the piers to carry the main columns of the structure, but also a continuous exterior wall which not only served as a foundation for the exterior columns but also acted as a retaining wall or coffer dam to resist the pressure of soil or soil and water on the outside of the wall and permeate the cellar excavation to be carried below water level. A typical instance of such modern construction was shown in the Federal Reserve Building completed in New York in 1924, where 2,910,000 cubic feet of space, or 182,000 square feet of floor area was provided below curb level for machinery, vaults for securities, storage of various kinds and other general purposes. The deepest pier in this building went down 118 feet below the high curb on Nassau Street and the deepest floor was 80 feet below the same level.

In bridge foundation construction possibly the most notable work in the period between 1914 and 1924 was that in connection with the anchorages and piers for the suspension bridge across the Delaware between Philadelphia and Camden. An essential element of the Camden anchorage was two reinforced concrete cribs, each 40 feet by 140 feet in plan, which by means of excavation were sunk through silt, sand and gravel of the river bank to rock 110 feet below high water level on the Delaware River. For the river piers pneumatic caissons were employed which were fitted with horizontal locks and galleries in the body of the pier so as to afford safety and more convenient access to the working chamber. These pneumatic caissons were built of steel and reinforced concrete 70 feet by 180 feet, and were sunk to a depth of over 75 feet. This did not show a very striking development either in size or method as the caisson for the New York and Brooklyn suspension bridge, though made of timber, was 172 feet by 102 feet, while that for the Eads Bridge at St. Louis was of boiler plate, 60 feet by 82 feet.

By 1924, however, a great deal of the practice had been standardized, an important addition to the modern caisson being a patented excavating lock through which an ordinary bucket could pass in and out of the compressed air without being detached from the hoisting rope. There was employment of improved air compressors. However most of the improvements in caissons for deep foundations involved such adjuncts as telephones and electric lights in the working chamber, and a better understanding of the physiological effects of compressed air. There was also developed the use

of the hospital lock so that the workmen were better protected and less exposed to danger, notwithstanding the fact that their employment under conditions of air pressure was regulated and restricted by local statutes or ordinances.

The modern tendency in using piles in foundations was to substitute those of concrete for timber piles, and several types of the former were being used extensively. One leading advantage was that the concrete pile when properly made was absolutely permanent under practically all conditions of use including both wet and dry service. Obviously their use did away with the possible danger of decay in case of water level below the cut-off level which was likely to happen under conditions where much subterranean construction acts to alter the natural water level. The simplest form of modern pile was one of reinforced concrete pile which had been cast and seasoned before driving and was used in the same manner as one of timber. There was also developed a steel shell and driving mandrel which was left in the ground and acted as a form in which the concrete could be poured. Still another type was a pipe which was closed at the bottom by a loosely fitting cast iron point. This pipe was sunk in the ground and then after being filled with concrete was removed, leaving the concrete pile and the point in the ground. Another system employed an open pipe which was driven in the ground and the material inside excavated by using a jet of compressed air. The vacant space thus formed could be filled with concrete, both pipe and concrete filling being left in the ground. For driving such pipes a hydraulic jack was employed and the method was found to be particularly useful in underpinning buildings.

"FOURTEEN POINTS." See WAR, DIPLOMACY OF THE, *War Aims*.

FOWLER, CHARLES EVAN (1867-). An American engineer, born in Bartlett, Ohio. He studied engineering at the Ohio State University and in 1887 began active practice. He designed and built many important railroad and other bridges and was consulting engineer for the Williamsburg Bridge in Manhattan. He also built many large plants and performed other work in Manila, Mexico, Cuba and many cities of the United States. He was a member of several scientific engineering societies and wrote much on building construction, including *Engineering and Building Foundations* (1919); *World Ports and Harbor Data* (1921).

FOX, DIXON RYAN (1887-). An American historian and professor, born at Potsdam, N. Y., and educated at Columbia University. He became assistant professor of history there in 1919. His works include *Decline of Aristocracy in the Politics of the United States* (1919), *Historical Atlas of the United States* (1920), and an *Outline of Early American History* (1922).

FOX, FONTAINE (TALBOT, JR.) (1884-). An American newspaper cartoonist born in Louisville, Ky., best known for his creation of "Fontaine Fox's Funny Folk," "Fontaine Fox's Cartoons," "The Toonerville Trolley," all collected in book form, and many other cartoons. He has been connected with the Wheeler Syndicate since 1915, and since that year has been furnishing humorous cartoons to some 100 newspapers.

FOX, PHILIP (1878-). An American astronomer, born in Manhattan, Kan. He grad-

uated from the Kansas State Agricultural College in 1897, and from Dartmouth in 1902, taking postgraduate courses in Berlin. After serving on the faculty of Dartmouth College, he became Carnegie research assistant at the Yerkes Observatory at the University of Chicago in 1903, and from 1907 to 1909 was instructor in astro-physics at the University of Chicago. From 1909 he was professor of astronomy and director of the Dearborn Observatory at Northwestern University. He served in the War as major of infantry, and as assistant chief of staff in the 7th Division.

FOX, WILLIAM (1879-). A motion picture producer born in Hungary and brought to the United States in infancy. He began his career as a theatrical manager in Brooklyn in 1904 and became president of the Fox circuit of theatres and the Fox Film Corporation. His best known productions include *Les Misérables*, *Tale of Two Cities*, *Romeo and Juliet*, *A Daughter of the Gods*, *Salome*, *Cleopatra*, *Evangeline*, *Over the Hill*, *The Queen of Sheba*, etc. He did excellent work for the Red Cross in its drives during the War.

FRAENKEL, SIEGMUND (1868-). An Austrian biochemist, known for his exhaustive works. Born in Krakau, he received the degree of M.D. from the University of Vienna and was appointed professor extraordinary of medical chemistry there. His *Arzneimittelsynthese*, devoted to the synthetic medical drugs and the relations between chemical constitution and physiological action, appeared in 1901, and has gone through several editions and a translation into English. *Descriptive Biochemie* appeared in 1907 and *Dynamische Biochemie* in 1911. His latest volume, *Praktikum der Medizinische Chemie*, was published in 1918.

FRAMPTON, SIR GEORGE JAMES (1860-). An English sculptor (see VOL. IX). Among his later works, marked by the decorative quality and fine modeling that distinguish his productions, were the Edith Cavell Memorial, London, the statues of Queen Mary for Victoria Memorial Hall, Calcutta, and for Government House, Delhi, and the portrait busts of King George and Queen Mary for the Guildhall.

FRANCE. A country of Western Europe, bordered on the south by the Mediterranean Sea and Spain, on the east by Italy, Switzerland and Germany, on the north by Belgium and Luxemburg, and the English Channel, and on the west by the Bay of Biscay and the Atlantic Ocean. Since the Treaty of Versailles its territory has been increased by the addition of Alsace and Lorraine (q.v.), which had been in the possession of Germany since 1870. Before the War, France was divided for administrative purposes into 87 departments (including the territory of Belfort, the remnant of the Haut-Rhin department left to France after the Franco-Prussian war of 1870). The Treaty of Versailles in 1919 restored Alsace-Lorraine to France, adding the three departments, Haut-Rhin, Bas-Rhin, and Moselle. The area of France was 207,054 square miles in 1913, and has been increased by the restoration of Alsace-Lorraine to 212,659 square miles. The population of France (the old area) in 1911 was 39,604,992, with a population density of 191 persons to the square mile, but war losses brought the population down to 39,209,518, with an average density of 184 to the square mile, in spite

of the new territories added, which had in 1921 a population of 1,709,749, with a density of 305 to the square mile. Of the total area of France in 1916 (136,101,760 acres) 52,694,680 acres were arable, 11,528,111 acres were natural pastures, 24,084,143 acres forest and woodland, 10,960,417 acres uncultivated, and the remainder cultivated in miscellaneous ways.

Population. The capital and largest city of France, Paris, had a population of 2,906,472 according to the census of 1921. The Department of the Seine, which comprises Paris and its suburbs, had a population of 4,411,691 in an area of 185 square miles, approximately the same as the area included in the City of Chicago. Other important cities are Marseilles (population 586,341 in 1921), the chief Mediterranean port and in most respects the leading port of France; Lyons (population 561,592 in 1921), the centre of French silk manufacture, at the confluence of the Rhone and Saône Rivers; Bordeaux (population 267,409), the chief port of southwestern France, the outlet of the Garonne valley; Lille (population 200,952), the textile and industrial city of northern France, before the War one of the most rapidly growing French cities, and in 1924 quickly recovering from war-time devastation; Nantes (population 183,704), on the Loire River near its mouth, the outlet for the valley of central France; Toulouse (population 175,434), an inland city on the upper Garonne River, in the centre of an important agricultural and viticultural region; St. Etienne (population 167,967), an important centre for silks, ribbons, and other industries; Strasbourg (population 166,767), formerly in German territory, an important river port and manufacturing city on the Rhine; and Le Havre (population 163,374) at the mouth of the Seine, a port of entry for Paris, of rising importance. The population of France, even in times of peace, tends to increase with extreme slowness. Several years in the period before the War showed excess of deaths over births; for instance, those of 1890, 1891 and 1892, and 1911. In 1920 and 1921 the birth-rate increased, the excess of births over deaths being 160,000 and 117,000 respectively. In 1922, however, the excess dropped to 71,000, making a percentage of increase of less than two-tenths of one per cent. There is no state religion in France, but the dominant faith is Roman Catholicism. The higher clergy in France numbered 2500, of whom 153 were in Paris. There were 31,500 curates and 9000 vicars in the country, besides 4000 ecclesiastics teaching in the universities and in the Catholic institutions. Protestantism in France was represented chiefly by synodal Presbyterianism. There were 850 associations of the Protestant faith in France, served by more than 1000 pastors and evangelists. The Protestant population of France was estimated at about 1,000,000. Judaism and Mohammedanism (the latter chiefly in Algeria) were also represented in France.

Education. Educational freedom is provided for by law in France. There were, consequently, a number of private schools maintained by individuals and associations, but all had to conform to national standards of learning and morality, and the state alone had the right to award diplomas and degrees, through examination of the aspirants. The public schools formed the bulk of the French educational system; together they made up the so-

called "Université de France," divided into three orders—primary education, secondary education, and higher education. The most elementary schools in France were the *écoles maternelles*, a sort of kindergarten; in 1912-13, there were 3976 of these schools, and in 1921-22 only 3431, due to the slowness of reestablishing schools of this type in the devastated regions; the number of pupils attending was 608,315 in 1912-13 and 246,985 in 1921-22. Next were the primary schools proper, numbering 83,095 with 159,982 teachers and 5,669,251 pupils in 1912-13, and 79,347 with 119,316 teachers and 4,452,000 pupils in 1920-21. In 1912-13, there were 83 primary normal schools each for males and females, with 4629 male and 4959 female pupils; while in 1922-23, there were 86 normal schools for males with 4538 students, and 86 for females with 5093 pupils. Secondary education for boys was given in 343 schools in 1913 to 100,203 students and in 367 schools in 1922 to 114,910 students, while secondary education for girls was given in 138 schools in 1913 to 33,282 students, and in 154 schools in 1922 to 45,047 students. Higher education was given to 41,109 students in 1913, of whom 16,763 were under the law faculty, 8247 students studying medicine, 6639 science, and 6398 letters. In 1924, there were 17 universities in France, at Aix-en-Provence, Algiers, Besançon, Bordeaux, Caen, Clermont-Ferrand, Dijon, Grenoble, Lille, Lyon, Montpellier, Nancy, Paris, Poitiers, Rennes, Strasbourg and Toulouse. The oldest was the University of Paris, founded in 1200, the newest that at Algiers, founded in 1885. The only illiteracy statistics available for France were those in connection with conscription for the army. In 1912, the percentage of illiterate conscripts was 4.18 and in 1921 it was 4.07. In the earlier year, 7694 could neither read nor write, and in the latter year, 6660.

Agriculture. France is preponderantly an agricultural country, notwithstanding the great importance of French manufactured products, but the proportion of rural inhabitants was steadily, though gradually, decreasing. According to the 1911 census, the rural population was 22,096,000 out of a total of 39,605,000, and according to the 1921 census, for the same area, the rural population was 20,119,000 out of a total of 37,500,000; for the new area of France in 1921, the rural population was 21,004,000 out of a total of 39,210,000. The proportion of persons actually engaged in agricultural work was slightly less; in 1911, the working population of France was 20,931,000, while the agricultural workers numbered 8,517,000. Thus in 1911 the ratio of agricultural workers to total workers was 407 to 1000, and the ratio of rural population to total population 558 to 1000. Wheat production, though increasing, was still below pre-war in France. Other crops were also slightly below normal, but generally greater in 1923 than in 1922. The table gives the relative acreage and quantities of the principal French crops, in 1923 and before the War.

Crops	Area (1000 acres)		Production (1000 metric tons)	
	1913	1923	1913	1923
Wheat	16,163	13,650	8,692	7,905
Oats	9,877	8,541	5,183	5,479
Rye	2,956	2,170	1,271	939
Barley	1,889	1,744	1,044	1,023
Potatoes	3,792	3,542	13,586	9,534
Sugar beets	577	365	5,939	3,222

Wine production fluctuated greatly from year to year but the acreage of vines did not change very rapidly. In 1913, the area devoted to vines in France was 3,803,000 acres, and the wine production 1,167,764,000 gallons (an unusually small production); in 1923, the acreage was reduced to 3,506,000 acres while the crop reached 1,509,314,000 gallons. Forage crops in 1913 covered 37,836,000 acres with a production of 96,000,000 metric tons; the area was increased by the addition of Alsace-Lorraine to 39,064,000 acres in 1921, with a production of only 58,000,000 metric tons. The number of horses in France on Dec. 31, 1922, was 2,778,000 compared with 3,222,000 on Dec. 31, 1913, but represented a considerable recovery from the war-time figure of about 2,250,000. Beef cattle on Dec. 31, 1922, numbered 13,576,000, compared with 14,788,000 on Dec. 31, 1913, but this also was a recovery from the war slump to 12,250,000. Sheep have been gradually declining in number for many years; at the end of 1882, there were 16,131,000, and at the end of 1922, only 9,782,000; during the War, however, the number went as low as 8,991,000. Raising of swine was also less important than formerly, but was increasing after the end of the War. On Dec. 31, 1913, there were 7,036,000 swine in France; on Dec. 31, 1918, there were 3,980,000; and on Dec. 31, 1922, there were 5,196,000. Milk production in France, while still below pre-war, was gradually approaching that level. In 1913, the total amount of milk produced was 128,072,800 hectolitres (1 hectolitre equals 26.42 gallons); in 1921, it was down to 106,503,550 hectolitres; but increased to 117,038,120 hectolitres in 1923. Milk for feeding calves was used to the extent of 28,986,430 hectolitres in 1913 and 25,536,830 hectolitres in 1923. Butter-making consumed 43,639,180 hectolitres in 1913 and 38,972,540 hectolitres in 1923, while cheese consumed 14,589,430 and 22,330,270 hectolitres, respectively.

Fisheries. The French fishing industry was greatly damaged by the War, not only by the requirement of fishermen for service in the army, but also by the requisitioning of boats and equipment. At the end of 1921, the number of vessels was only 23,301, in spite of increases since 1918, as compared with 29,451 in 1912. The number of steam and motor vessels was increasing, but sailing craft still predominated. Statistics of the value of the catch were not available for a post-war year. In 1912, the value of fresh fish was about 88,000,000 francs, as follows: cod, 26,000,000 francs; herring, 13,000,000 francs; sardines, 9,000,000 francs; mackerel, 7,000,000 francs; tuna fish, 5,000,000 francs; and oysters, about 28,000,000 francs.

Food Imports. Imports of foodstuffs, in spite of smaller crops after the War, except in the case of potatoes, did not equal pre-war quantities. See table on page 495 for quantities imported and exported in 1913, 1922, and 1923.

Minerals. The leading minerals produced in France were coal, iron, gold, lead, zinc, silver, copper, antimony, manganese, tungsten, bauxite, iron pyrites, mineral oils, salt potash, and stone of various kinds, but not all of these were produced in important quantities. Coal production in 1913 reached 40,844,000 tons, and during the War dropped to hardly more than half that amount. After the War the production of coal in the Saar Valley (q.v.), which

Commodity	IMPORTS			EXPORTS		
	1913	1922	1923	1913	1922	1923
	(Quantities in metric tons)					
Wheat	1,555,651	675,198	1,416,795	1,605	18,399	13,247
Oats	580,481	360,018	129,763	2,697	6,656	38,252
Barley	116,038	52,864	69,730	9,525	10,466	21,547
Rye	46,688	258	37,179	158	21,701	7,883
Maize	590,817	534,556	563,759	2,367	3,019	2,719
Wheat flour	10,053	2,603	6,891	20,498	42,544	44,785
Potatoes	193,580	371,092	296,003	181,096	140,025	219,406

was to be administered by France for a period of 15 years, and which amounted to about 10,000,000 tons a year, was added to French production. Even so, this did not greatly exceed pre-war production, though the latter half of 1923 showed an average of about 4,500,000 a month, which, had it characterized the whole year, would have made the yearly total 54,000,000 tons; the actual 1923 production, however, was only 47,832,000 tons. All of these figures included lignite, production of which reached about 900,000 tons per year. In January, 1924, French coal production, exclusive of the Saar, was 3,794,000 tons, compared with a monthly average of 3,404,000 tons in 1913. This was one of the first and the most striking instances of an advance over pre-war coal production within the actual confines of France. Production of iron ore in France after the War included the production of Alsace-Lorraine, which in 1913 was 21,133,600 tons. In 1913, France produced 21,918,000 tons of iron ore, but it was extraordinarily great in that year, having been 19,160,000 tons in 1912 and 16,630,000 tons in 1911. In 1923, production reached 23,325,564 tons, including the production in Alsace-Lorraine. French gold production after the War was negligible; in 1913, about 150,000 tons of ore were mined, yielding 2250 kilograms of gold (1 kilogram = 2.2 pounds); in 1920, only 4137 tons of ore were produced. The amount of lead ore produced in 1913 was 17,081, and in 1920 was 4808 tons. Zinc ore production was 46,577 tons in 1913 and fell to 4247 tons in 1920. Copper ore production was very small, being 521 tons in 1913 and 373 tons in 1920. France ranked second to China in antimony production, with 21,672 tons of ore in 1914, rising to 33,462 tons in 1917, and sinking to 4411 tons in 1921. Bauxite (the ore of aluminium) was produced in fairly large quantities in France. In 1913, French production was 309,000 tons out of a world production of 536,000 tons. In 1921, it had dropped to 139,902 tons, but was again increasing. In the first 10 months of 1923, 269,600 tons were mined. In 1913, production of iron pyrites was 311,167 tons, and in 1921, 172,370 tons. Mineral oil production in France was 49,584 tons in 1913, and in 1921, with the addition of the production of Alsace-Lorraine, it was 55,574 tons. Salt was produced from sea water and was also mined in France; the production of mined salt dropped from 900,000 tons in 1913 to 541,000 tons in 1915, but increased again to 1,048,000 tons in 1922; sea salt production was 382,000 tons in 1913 and 433,000 tons in 1920. Potash production, owing to the acquisition of Alsace-Lorraine, where the most important beds were found, was much greater than before the War; in 1913, the production of potash salts was 355,341 tons, with 56,000 tons of pure potash content, this figure representing a considerable increase from previous years; in 1923, production was 1,026,400 tons containing 248,523 tons of pure potash.

Industries. French metallurgical industries were, by 1924, fairly active, and the addition of the Alsace-Lorraine industrial area increased the amount of French production. In 1913, French pig iron production was 5,208,000 metric tons; in 1923, it was 5,304,000 tons, and in January, 1924, reached the high monthly mark of 586,000 tons, compared with a 1913 monthly average of 434,000 tons. Crude steel production advanced similarly; 4,692,000 tons were produced in 1913, 4,980,000 tons in 1923, and 540,000 tons in January, 1924. Exports of French metallurgical products in 1913 amounted to 1,008,000 tons; in 1919, exports had dropped to 367,000 tons; but by 1923 they had risen again to 2,536,000 tons, more than twice their pre-war amount. The number of blast furnaces in operation at the end of 1923 almost reached the pre-war figure, with 125, as against 129 in 1913. The machine tool industry in France was recovering, especially in 1923, from the depression it experienced immediately after the War. During the War a large stock of machines was imported from Great Britain and the United States which had to be disposed of gradually before the native industry could resume normal operations. Imports from the United States, because of the high dollar exchange, were restricted in 1923, and imports from Germany also declined considerably, though for very different reasons, among them the stagnation of German industry, the difficulty the Germans had in making deliveries, and the prejudice against German goods. In this way the French industry was greatly stimulated and an increasing proportion of such machinery was being bought in France. The local market for metal-working machinery has been stimulated by the revival of a number of industries requiring the machines. Automobile manufacture was also gaining in volume, with increasing sales both at home and abroad. The following table shows the development of the export trade in automobiles, with the advance over pre-war volume as well as prices:

Year	Weight (metric quintals)	Value (millions of francs)
1913	258,000	227 (gold)
1919	59,000	125 (paper)
1920	514,000	884 "
1921	376,000	666 "
1922	341,000	557 "
1923	407,000	812 "

The chemical industries of France, always important, were becoming more so from an international standpoint. Production and exportation of perfumes and soaps also reached a level above pre-war. The foreign trade in chemicals and in perfumes and soaps is shown in the table on page 496.

The textile industries did not, in 1924, vary greatly in amount of equipment from pre-war, notwithstanding the setback given to the cotton, wool, and linen industries of northern France by the wanton devastation of the Ger-

man occupation. In 1913, with a total of 16,000,000 sheep, the French production was about

EXPORTS OF CHEMICAL PRODUCTS (in metric quintals)		
Year	Miscellaneous chemicals	Perfumes and soaps
1913	11,126,000	514,000
1919	4,019,000	302,000
1920	9,197,000	527,000
1921	9,645,000	466,000
1922	15,506,000	544,000
1923	16,463,000	658,000

30,000,000 kilograms of wool, an average of 1 875 kilograms per head. In 1922, when the number of sheep was about 9,500,000, the production was estimated at 19,000,000 kilograms, an average of 1.930 a head. The Roubaix-Tourcoing district on the Belgian border was the principal woolen manufacturing district of France. In 1913, a monthly average of 4955 metric tons of wool tops was recorded in this region, and in 1923 a monthly average of 5451 metric tons; other production in this region (yarn, noils, etc.) brought the total monthly average for 1913 to 8714 metric tons, and to 8330 metric tons for 1923. Imports of raw wool, by 1924, were at a higher rate than before the War, as were exports of woolen cloth, which reached about 25,000 metric tons in 1923, compared with 23,000 in 1912. Exports of woolen yarns were also increasing over recent years, but comparable figures for 1913 were not published. The equipment of the woolen industry at the end of 1922 was as follows: spindles for woolen yarns, 670,131 (against 712,000 in 1913); spindles for worsted yarns, 2,292,409 (against 2,500,000 in 1913); mechanical looms, 55,000, the same as pre-war (there were also several thousand hand looms in operation but the exact number was unknown); combing units, 1757 (against 2500 in 1913). The total output of woolen goods was estimated at 66,000,000 pounds in 1922, compared with 30,000,000 pounds in 1921, showing the considerable recovery in this industry. The cotton industry was still considerably below normal in output and the year 1923 did not show any pronounced increase in activity over the previous year. Cotton spinning in 1922 was not more than two-thirds of the 1913 amount, and approximately the same was true of 1923. Weaving in 1922 improved distinctly over the years immediately preceding, but was still considerably below the degree of activity shown in 1914. In 1922, the average monthly production per loom in lengths of approximately 100 meters was 5.07, compared with 7.70 in May, 1914. There were 9,605,000 spindles for spinning cotton in France at the end of 1922, and 1,223,214 for twisting. Mechanical looms numbered 180,560 and hand looms 27,800. Culture of raw silk and silk manufacture were both important industries in France, but, while the former had been declining for a long period, the latter continued to maintain, and tended to increase, its importance. Production of silk cocoons was at a maximum in 1867, when a weight of 14,083 metric tons was reached; by 1913 the weight of cocoons had declined to 4423 tons; while in 1915 the low point of 1739 tons was reached. In 1923, a return to 3130 tons was achieved. The value of finished silk goods increased greatly in the past few years, due mainly to the depreciation of the franc and the increased prices even in terms of gold values. In 1913, the

value of the production of silk goods in the Lyon district was 467,700,000 francs (\$93,540,000 with the franc at about five to the dollar); in 1923, it was 2,812,000,000 francs (\$187,500,000 with the franc at about 15 to the dollar). In the latter total is included artificial silk to the value of 370,000,000 francs. In 1922, there were in France 600 factories with a total of 1,200,000 spindles for silk spinning and throwing, and the total silk conditioned was 6613 metric tons. Export trade in textile goods is shown in the table, revealing the practically complete recovery in silk and wool, with a considerable deficiency still existing in the cotton goods trade.

MANUFACTURED GOODS AND FABRICS EXPORTED (quantities in metric quintals)			
Year	Cotton	Wool	Silk
1913	554,000	234,000	62,000
1919	350,000	55,000	60,000
1920	479,000	143,000	76,000
1921	587,000	156,000	57,000
1922	437,000	188,000	63,000
1923	447,000	255,000	76,000

Ship construction in France in 1923 was at a low ebb both as compared with the two previous years and as compared with 1913. There were certain favorable features, however, toward the end of the year. Formerly French shipyards were largely dependent on orders from the government, and building for private interests might be called supplementary. In 1924, with the low cost of the franc, French builders had contracts for vessels from a number of foreign companies, including orders from Holland, Norway, Egypt, and even Great Britain. The monthly average of gross tonnage launched in 1923 was 8054, compared with 15,376 in 1922, and 14,674 in 1912. Tonnage under construction at the end of 1923 was 110,725 gross tons, compared with 188,525 on Dec. 31, 1922.

Unemployment in practically all French industries was negligible in 1923. In fact, there was a continual influx of labor from other countries less favorably placed. No statistics were available comparing the situation with the pre-war period.

Foreign Trade. French foreign trade in 1923 made a very favorable showing. Imports were valued at 32,614,560,000 francs (equivalent to \$1,982,965,000 with the franc at the average for the year, \$0.0608), compared with 23,930,600,000 francs (equivalent to \$1,959,840,000 with the franc at \$0.0820) in 1922, and with 8,421,300,000 francs in 1913 (equivalent to \$1,625,311,000 with the franc at par of exchange, \$0.193). Exports in 1923 were valued at 30,431,510,000 francs (equivalent to \$1,849,141,000), compared with 20,642,000,000 francs in 1922 (equivalent to \$1,692,640,000), and with 6,880,200,000 francs in 1913 (equivalent to \$1,327,879,000). Thus the unfavorable balance in 1923 was \$133,824,000 or 7 per cent, compared with \$267,209,000 or 16 per cent in 1922, and with \$297,432,000 or 22 per cent in 1913. From the point of view of visible trade balance, therefore, France was by 1924 considerably better off than before the War. Itemized into main classes of commodities, the foreign trade of France in 1923 showed a tendency to revert to the normal distribution; i.e. exports of manufactured goods far outweighing foodstuffs and raw materials, and imports of raw materials being by far the most important group in the

incoming trade. The accompanying table gives the figures in francs for the three years, 1913, 1922, and 1923. In considering actual values, the average of the franc in the three years, as shown in connection with the trade totals, should be borne in mind. Of the imports of raw materials, 583,997,000 francs covered coal, coke, etc., in 1913, to the amount of 22,866,967 metric tons; 2,397,763,000 francs in 1922 to the amount of 28,987,108 tons, 3,644,794,000 francs in 1923 to the amount of 30,672,847 metric tons.

FRENCH IMPORTS

* See note regarding exports

The principal classes of commodities in the import trade of France were coal, which occupied first rank with a value of 1,925,991,000 francs in 1922, but was in third place in 1913; raw cotton, second in 1922, with a value of 1,710,872,000 francs, and also second in 1913; raw wool, third in 1922 with 1,669,038,000 francs, but in first place in 1913; raw silk, fourth in 1922 with 1,295,176,000 francs and

fifth in 1913, machinery made of iron and steel, fifth in 1922 with 890,897,000 francs, and seventh in 1913. Except the last item, all of the foregoing principal commodities have been the raw materials for French manufactures; the fact that the manufactured product, machinery, which in 1913 came seventh, was in fifth place in 1922, is an indication that in some respects France had not entirely regained her position as a manufacturing nation. In sixth place in 1922 were imports of oilseeds and oil fruit, with a value of 837,336,000 francs, which had been in fourth place in 1913; in seventh place in 1922 were wines, with 798,991,000 francs, eighth in 1913; in eighth place in 1922, crude and refined mineral oils, with 748,575,000 francs, thirteenth in 1913; in ninth place in 1922, coffee, with 636,209,000 francs, tenth in 1913. In tenth place, woods for building, with 602,059,000 francs, eleventh in 1913. Wheat had dropped to twelfth place as an import item, with a value of 443,644,000 francs, whereas it had occupied sixth place with 335,884,000 francs in 1913. The leading commodity in the French export trade in 1922, which was also leading in 1913, but by a much narrower margin, was silk fabrics, with a value of 1,377,847,000 francs; second came women's clothing, with a value of 1,065,000,000 francs, having risen from tenth place in 1913, third were cotton fabrics, with 1,059,521,000 francs, falling from second place in 1913; fourth, pig iron, iron and steel, with 1,003,445,000 francs, rising from relative insignificance in 1913, as a result of the addition of Alsace-Lorraine with its important metallurgical industries; fifth, wool fabrics, with 850,658,000 francs in 1922, falling from fourth place in 1913; sixth, paper and paper manufactures, with 793,034,000 francs, eighth in 1913; seventh, raw wool, with 679,346,000 francs, third in 1913; eighth, machinery with 573,945,000 francs, twelfth in 1913; ninth, manufactured rubber (including automobile tires) with 535,928,000 francs, sixteenth in 1913; and tenth, tools and metal goods, with 500,529,000 francs, thirteenth in 1913. The general trend seemed to be toward an even greater concentration of the export trade on manufactured commodities than before the War.

Trade with the United States. Raw cotton continued to be by far the most important commodity imported by France from the United States, but the percentage of imports of American cotton to total French cotton imports declined from 79 per cent in 1921 to 69 per cent in 1922 and to 62 per cent in 1923. The value of cotton imports from the United States in 1923 was 1,929,602,000 francs, out of a total importation from the United States in that year amounting to 5,049,060,000 francs, or practically two-fifths of the total. The United States was still the chief source of French supplies of crude and refined mineral oils, which formed the second most important item in the trade in 1923. The proportion supplied by the United States rose from 74 per cent in 1921 to 77 per cent in 1922 to 81 per cent in 1923. Imports from the United States of copper, the third item in the trade, formed about three-fourths of the total French imports of copper. The share of the United States in the French cereal import trade was constantly diminishing, amounting to only 17 per cent in 1923, compared with 30 per cent in 1921, but imports from the United States were still very impor-

tant, exceeding every other single country except Argentina. All kinds of machinery were imported from the United States in considerable quantities. In 1923, coal was also among the leading commodities imported from the United States, but this was abnormal, due to the unsettled conditions in Germany, and the strikes in England during a portion of the year which restricted imports of coal from that country. The other commodities of importance among French imports from the United States were sugar, in which, however, the United States was losing ground in favor of the Dutch East Indies; salted and preserved meats, of which in 1923 the United States sent 66 per cent of the total French importation; raw hides and skins, the United States ranking fourth as supplier; automobiles, of which this country furnished nearly 90 per cent of the French imports; and lumber, with our share steadily increasing, yet amounting only to 6 per cent in 1923. French exports to the United States of greatest importance were for the most part those leading in the exports of France to all countries. There was no commodity of such outstanding importance, however, as was cotton in the case of imports. The United States was the second best customer of France for silk and artificial silk fabrics—the most important item in the trade in 1923, with a value of 386,513,000 francs—and next to Great Britain. Ready-made clothing occupied second place with a value of 331,959,000 francs in 1923, and this amount was far from representing the total American purchases of French clothing, as it did not take into account the extensive purchases of French clothing made by American tourists in France, and carried home in their trunks. Other leading items in order of their importance in 1923 were published matter, cinema films, etc., raw hides and skins, cotton fabrics, and woolen fabrics, each of which was valued at more than 100,000,000 francs; synthetic perfumes and essential oils, articles of leather or artificial leather, and rags, with values over 50,000,000 francs; and chemicals (excluding potash), perfumes and soaps, raw silk and silk floss, seeds for sowing, paper and table fruits, with a value of more than 30,000,000 francs each.

Reconstruction. The chief difference between pre-war and post-war France lay in the condition of northern and northeastern France, overrun by the German forces from 1914 to 1918. The extent of the damage and of the reconstruction accomplished and to be accomplished was dealt with in publications issued by the ministry of the liberated regions, but it was impossible for any statistical publication to convey an idea of the amount of work and expense necessary to restore the region to its former degree of productivity, if indeed complete restoration was possible. Outside of the cost of the War itself, no factor was so potent in creating the harassed situation of the French treasury as the cost of reconstruction, which the impossibility of obtaining reparations threw wholly on the shoulders of France. In 1914, the population of the devastated departments of France was 4,690,183; by the Armistice it had dropped to 2,075,087, the population having been largely driven to other sections, thus placing a burden on those sections and on the French government. The reflux of the population to the devastated provinces was nearly

complete, by 1924, if war deaths are taken into account. In January, 1924, the population of the region was 4,253,677. The number of buildings in the district in 1914 was 1,190,006 and of these 893,792 were damaged or destroyed during the War, comprising 866,844 houses and agricultural structures, 17,616 public edifices, and 9332 industrial establishments, employing at least 10 workmen. About 39 per cent of the buildings were totally destroyed, and 61 per cent damaged to a greater or less degree; the destruction was greatest in the Nord department, where the important cotton wool textile factories were, and again are, located; 33 per cent of the factories damaged were in this department. To January, 1924, the number of establishments entirely restored was 438,710 (slightly over 50 per cent), of which 423,145 were houses and agricultural structures, 7602 public edifices, and 7963 factories, the latter approaching the nearest to pre-war conditions. Much of the reconstruction was carried out through "Coöperatives of Reconstruction"; advances made to these societies amounted to 2,015,559,347 francs in 1921; 2,253,495,517 in 1922, and 2,304,920,000 in 1923. Municipal life was suspended in 3255 communes during the War, and was resumed in 3239, leaving only 69 permanently deleted. The number of public schools (primary, secondary, and advanced) in the devastated regions was actually greater than in 1914, being 7846 on Jan. 1, 1924, compared with 7400 in 1914, but the number of pupils declined from 668,000 to 497,477; the number of private schools sank from 1060 to 849, and pupils from 131,700 to 88,385. The amount of money allotted by the Republic to refugees and for temporary succor reached a total of 1,161,087,936 francs, and this amount must be considered in addition to all sums spent for reconstruction. Donations received by the French administration from private persons and associations in France were valued at 6,473,609 francs, and from foreign sources at 8,484,755 francs, besides money gifts of 23,111,311 francs from France and 17,396,874 francs from abroad, making a grand total of 55,466,549. The total amount of the damage to French property was estimated, in January, 1924, at \$5,000,000,000 francs, of which 25,420,000,000 covered industrial property, 20,213,599,000 francs farm property, and 39,366,401,000 francs other property. To this total should be added the following:

	Francs
1. Interest on the 1914 value of the damage,	3,000,000,000
2. Labor, and purchases made directly by the state,	5,500,000,000
3. Rebuilding of railways,	2,650,000,000
4. Reorganization of public services,	2,700,000,000
5. Assistance rendered to persons,	1,400,000,000
6. Expenses of administration,	1,200,000,000

This brought the total above 100,000,000,000 francs. Up to Jan. 1, 1924, the amount of work actually accomplished was estimated at 52,658,930,313 francs. With this staggering expense to add to the cost of the War, it was scarcely remarkable that the financial situation of the government had become unenviable, or that the failure to receive the reparations decreed against Germany had caused serious distress, as well as extreme distrust and dislike of the German people.

Finance. Before the War, French budgets

had a practical balance of receipts and expenditures, though in some years expenses showed a greater or less excess. The accounts for the "fiscal period" 1913 (i.e. amounts properly attributable to the year 1913, whether received or spent in that year or in 1914) showed revenues amounting to 5,103,000,000 francs and expenses amounting to 5,349,700,000 francs, with an excess of expenses amounting to 246,700,000 francs. The budget for the year 1914 provided for a slight surplus, but war expenses upset the calculations, and initiated the period of large budgets which continued ever since. The table shows expenses from 1914 to 1921, distributed according to their character, whether military expenses, interest and sinking fund on the debt, civil or ordinary expenses, reconstruction expenses, and the debit balance of special accounts.

and foreign loans about 20 per cent. The French budget after the War was made up of three main divisions, the general budget (covering ordinary and extraordinary receipts and expenses), the annexed budgets (covering the various state monopolies and services), and the special budget of expenses called "recoverable," arising from war and reconstruction costs, which were chargeable against German reparations. It should be noted that in view of the failure to receive reparations due, these "recoverable" expenses up to 1924 only served to increase the deficit. The general budget for 1922 showed expenses amounting to 24,687,958,948 francs and revenues amounting to 24,702,059,912 francs, giving a surplus of 14,100,964 francs, while the general budget for 1923 showed expenses of 23,402,487,556 francs and receipts of 23,437,954,832 francs, with a surplus

FRENCH EXPENSES FROM 1914 TO 1921

Year	Debt Charge	Other Civil	War	Reconstr'n	Debit Balance Spec. Accts.	Total
(values given in millions of francs)						
1914	1,360	2,005	6,894	4	108	10,371
1915	1,835	2,479	16,594	15	1,197	22,120
1916	3,434	2,817	26,348	345	3,904	36,848
1917	4,965	4,129	31,895	689	2,983	44,661
1918	7,189	5,482	41,370	495	2,113	56,649
1919	8,089	9,758	23,375	9,604	3,387	54,213
War period	26,872	26,670	146,476	11,152	13,692	224,862
1920	15,201	11,855	10,286	15,709	5,092	58,143
1921	16,000	10,778	8,702	13,829	2,714	52,023
Post-war period	31,201	22,633	18,988	29,538	7,806	110,166
Grand total	58,073	49,303	165,464	40,690	21,498	335,028

The most striking features of the tabulation were the steadily increasing burden of the public debt, and the steady contraction of military expenses after the end of the War. Receipts in the same period are indicated below:

Revenue receipts	
1914-1919	37,821
1920 and 1921 (viz., 1920, 19,821, 1921, 21,543)	41,364
Total revenue receipts	79,185
Receipts from borrowing to Dec. 31, 1921	
Permanent loans	104,092
Floating debt	
Bank of France	24,600
Treasury bills, etc.	61,741
Total internal loans	190,433
Foreign loans—realized and to be repaid at par of exchange	35,563
Total borrowing receipts	225,996
Grand total receipts	305,181
Authorized expenditure in excess of receipts	29,847

In the absence of final data, the two sides of the account, expenditures and receipts, cannot be reconciled. Apparently the excess of "expenditures authorized" above "receipts realized" represents expenditures authorized but not made and for which it was therefore not necessary to provide resources. (The tables and data which are given above are from *French Public Finance* by Harvey E. Fisk.) The resources with which to meet the expenses of the war period were derived 18½ per cent from taxation, 65.17 per cent from borrowing at home, and about 16.33 per cent from foreign loans. The Bank of France furnished 15.27 per cent of the amount, national defense bills 28.77 per cent, other temporary loans 35.93 per cent

of 35,467,276 francs. The tables on the next page itemize expenses in the two budgets.

Economies in expenses of various kinds, and increases in ordinary and permanent sources of revenue alone prevented a considerable deficit from appearing in the general budget for 1923. The annexed budgets, 12 in number, balanced at 3,661,094,017 francs for 1922 and at 5,225,890,356 francs for 1923; surpluses or deficits in these budgets were transferred to the general budget, increasing receipts or expenses there as the case might be, leaving them always in balance. The "special budget of recoverable expenses" for 1922 showed expenses of 10,558,534,377, with order and miscellaneous receipts amounting to 1,309,855,000 francs, leaving approximately 9,250,000,000 francs to be raised by borrowing. The special budget for 1923 showed expenses amounting to 13,581,690,114 francs, with revenues of 3,508,660,000 francs, leaving 10,073,000,000 francs to be met by borrowing. In addition to the above items were amounts set aside for the "upkeep of troops of occupation in foreign countries," set at 520,816,700 francs for 1922 and 1,030,936,710 francs for 1923. No receipts were shown against these expenditures, but according to the law of Dec. 31, 1918, the expenses were to be added on the reparations due from debtor governments.

The public debt of France was large even before the War. It was divided into the following categories: perpetual debt (also called consolidated), term or amortizable debt, floating debt, and annuities (*dette viagère*). In 1913, the perpetual debt amounted to 21,922,000,000 francs, the amortizable debt to 3,388,000,000 francs, and annuities (*dette viagère*) to 6,146,000,000 francs, making a total funded debt of

31,456,000,000 francs; treasury bills amounted to 410,000,000 francs, other floating debt to 1,671,000,000 francs and surety bonds to 100,000,000 francs, making the total unfunded debt 2,181,000,000 francs; as there was in 1913 no foreign debt, the total public debt amounted at that time to 33,637,000,000 francs, or about \$6,500,000,000 at par of exchange. No foreign debt was recorded at this period, the whole amount being raised within the country. The latest available statement of the French public debt was that of Dec. 31, 1923. At that time

Bank of France was 3,342,800,000 francs in gold and 629,300,000 francs in silver, making a total of 3,972,100,000 francs. The average note circulation of the bank in the same year was 5,665,300,000 francs, making the percentage of metallic reserve to note circulation just over 70. On Dec. 20, 1923, the gold reserve in the bank was 3,676,000,000 francs, that held abroad, 1,864,000,000 francs and the silver reserve 296,000,000 francs, making a total reserve of 5,836,000,000 francs. On the same date the note circulation was 37,630,000,000 francs, and the per-

ESTIMATES OF GENERAL BUDGET EXPENDITURES, 1922 AND 1923

Items	1922	1923

Total	24,687,958,948	28,402,487,556

ESTIMATES OF GENERAL BUDGET RECEIPTS, 1922 AND 1923

Items	1922	1923
	Francs	Francs
Taxes and revenues	15,753,034,327	17,101,602,616
State monopolies and industries	2,910,179,748	1,997,978,290
State domains	183,330,900	236,222,400
Order receipts	797,943,987	805,829,426
Miscellaneous budget receipts	176,461,000	260,990,100
Special receipts	4,870,000,000	3,025,000,000
Algerian receipts	11,110,000	10,332,000
Total	24,702,059,912	28,437,954,832

the total internal debt was shown as 270,708,103,000 francs of which the major items were: *rentes* of various categories (consolidated perpetual and amortizable issues), 110,515,995,000 francs; national defense bills (short term), 55,848,000,000; 2 to 10 year treasury bonds (also short term), 24,516,000,000; long and short term Credit National issues (forming part of the reconstruction debt), 23,978,000,000 francs; and advances from the Bank of France (floating debt), 23,300,000,000 francs. The external debt amounted to 38,794,936,000 gold francs, but owing to the depreciation of the franc this was the equivalent of 146,800,000,000 paper francs at the value of the paper franc in on that date. The total debt, internal and external, on Dec. 31, 1923, therefore, was approximately 417,508,000,000 paper francs, equivalent, with the franc at \$0.351 as quoted in New York on that date, to \$21,293,000,000. It was a curious fact that although the debt rose from 349,585,000,000 paper francs on Dec. 31, 1922, to 417,508,000,000 paper francs a year later, the greater depreciation of the franc on the latter date caused the amount of the debt in gold dollars to sink from \$25,660,000,000 to \$21,293,000,000. Aside from budget deficits and the increase in the public debt the chief reason for the depreciation of the French currency in 1924 was the large note circulation of the Bank of France as compared with the metallic reserve. In 1913, the average metallic reserve of the

percentage of metallic cover to note circulation 15½.

Transportation. France was well provided with means of communication, internally by means of railways, rivers, and canals, and externally by the same means and also through harbors and ports and with the help of an extensive merchant marine. The principal railway systems of France (pre-war boundaries) were state railways, 5623 miles in 1923; Paris-Lyon-Méditerranée, 6078 miles; Nord, 2380 miles; Orléans, 4641 miles; Est, 3122 miles; and Midi (south), 2586 miles; making a total of 24,430 miles in 1923, compared with 24,417 miles in 1913. The railways of Alsace-Lorraine, 1405 miles in length, should be added, making a total length of 25,835 miles in 1923. Passengers carried numbered 547,886,000 in 1913 and 591,664,000 in 1921, a total distance of 19,410,000,000 kilometers in 1913, and 24,138,000,000 kilometers in 1921. The amount of slow freight carried was 208,019,000 tons in 1913 and 23,905,000,000 kilometers in 1921. Statistics for local railways were not available after 1912; in that year, their length was 6158 miles and the number of passengers carried 48,170,000; tramway lines had a length of 4218 miles and carried 37,143,000 passengers. Car loadings in 1913 averaged 60,741 daily and in 1923, 56,865 daily. However, the average load was 12 tons per car in 1923 and only 9.1 tons in 1913. On Dec. 31, 1920, the French merchant

marine comprised 13,292 sailing vessels of 433,441 net tons, with crews of 48,449 men, compared with 15,824 vessels, 601,983 tons, and 67,453 men on Dec. 31, 1913, and 2246 steam vessels, with 1,084,511 tons, 20,268 seamen, and 13,402 mechanics and stokers in 1920, compared with 1895 vessels, of 980,433 tons, with 18,552 seamen, and 12,725 mechanics and stokers in 1913. The amount of idle tonnage in French ports steadily decreased in 1923 from 530 vessels of 845,254 tons on Jan. 15, 1923, to 334 vessels of 448,000 tons on Jan. 15, 1924. The net tonnage entering French ports was 2,970,000 in 1922 compared with 2,876,000 in 1913 and departing tonnage 2199 compared with 2176. Goods tonnage discharged averaged 2,383,000 tons per month in 1922 compared with 2,657,000 in 1913, while goods loaded averaged 583,000 tons compared with 868,000. The table shows the cargo traffic of the principal French ports in 1913 and 1923.

Port	CARGO TRAFFIC OF FRENCH PORTS			
	1913		1923	
	Entered	Departed	Entered	Departed
	(in metric tons)			
Dunkirk ..	2,880,400	1,005,600	4,619,900	522,800
Le Havre	2,747,900	920,500	3,554,500	929,500
Rouen ...	5,147,700	449,900	8,550,000	344,800
St Nazaire	1,490,900	252,200	1,317,700	205,400
Nantes ..	1,611,300	352,400	1,887,400	207,600
Bordeaux	3,302,900	1,302,500	3,317,900	1,504,500
Marseilles ..	5,886,200	3,052,400	5,327,500	1,907,200

The length of navigable rivers in France was 4211 miles and the length of canals 3280 miles. In 1913, shipping tonnage on the rivers totaled 21,057,000 tons and on the canals 20,840,000 tons; in 1923, river tonnage was 17,799,000 tons and canal 16,085,000, both representing satisfactory increases over 1922 though less than 1913.

History. On Dec. 1, 1913, the moderate Barthou cabinet was overthrown. The Radical-Socialists who had been most instrumental in forcing Barthou out of office filled seven of the 12 ministerial posts in the new cabinet formed by Gaston Doumergue. Joseph Caillaux, to whom still attached the stigma of the Morocco settlement of 1911, and who for this reason was impossible as prime minister, became Minister of Finance and was directing genius of the cabinet. Although Premier Doumergue was in fact an active Radical-Socialist he did not, in view of the forthcoming elections, adhere strictly to the principles which the Radical-Socialist Party had recently enunciated at its Unification Congress of Pau, and concentrated his attention on the financial proposals of Caillaux rather than on the delicate question of the Three Years Law. Nevertheless the impending electoral combat had produced a clear-cut cleavage between the two most powerful political groups: the Radical-Socialists and the Unified Socialists coöperated toward the reduction of military service from three to two years, while in opposition to this "pacifist" bloc Barthou, Millerand, and Briand had organized the Federation of the Left with a programme of electoral reform and of national defense based on the Three Years Law. In March, 1914, the cabinet became involved in scandal. The shooting of Gaston Calmette by Madame Caillaux and the subsequent disclosures revealing an old financial scandal forced both Caillaux and his lieutenant Monis (Minister of Marine) to resign during the latter part of March.

Meanwhile the electoral campaign was on, centering for the most part on the question of the Three Years Law. The elections held in May produced the following line-up in the new Chamber: Unified Socialists 102; Independent and Republican Socialists 30. Unified Radicals 136; Alliance Democratique 100; Independent Radicals and Left Republicans 102; Progressists and Republican Federation 54; Action Libérale 34; Right 36; Independents 16. The bloc of the Radicals and Socialists had more than held its own. Nevertheless the Doumergue cabinet, in accordance with custom, resigned before the meeting of the new Chamber. A ministerial deadlock ensued in the course of which a Ribot cabinet was smashed by the Radical-Socialist bloc within 24 hours of its formation. After a fortnight of difficulties René Viviani succeeded in forming a new cabinet on the basis of a policy of national defense. The success of his policy, faced as it was with strong Radical-Socialist opposition, would have been greatly in doubt had not the revelations as to the unpreparedness of the French army, which were made in the Senate on July 13, sufficiently aroused the Chamber to support the Premier and vote the military credits.

While the French public was deeply absorbed in the sensational trial of Madame Caillaux during the latter part of July, President Poincaré, accompanied by Premier Viviani in his capacity as Foreign Minister, set out to visit France's ally, Russia. The Kronstadt Conference brought a further cementing of the alliance between France and Russia. The French statesmen returned to Paris on July 29, just after the Austrian ultimatum had been delivered to Serbia. When war between Russia and Germany seemed unavoidable the German government requested of the French government a definite answer as to the attitude of France in case of a Russo-German conflict. In view of her alliance with Russia, France felt compelled to answer that she "would consult her interests." Orders for mobilization were issued in France and Germany on August 1, and two days later war was declared by Germany on France. See *WAR IN EUROPE*.

The French people received the news with patriotic fervor. Their outward calmness was marred, outside of a few minor occurrences, only by the assassination of Jean Jaurès, the great Socialist and pacifist, on July 31 by Raoul Villain, who acted under the influence of the extreme Royalists. Confronted with a situation which called for the greatest efforts and sacrifices, the parliamentary factions abandoned all partisan strife and concluded a truce, known as the "Union Sacrée," to which even the Socialists subscribed. The draining of man power from all walks of life took place without friction and a financial panic was averted by a moratorium. Measures were taken to provide for the maintenance of an adequate food supply, and a rigid censorship was imposed. In order to deal more effectively with the unfavorable military situation and to make the government more representative, Premier Viviani resigned on August 26, on the eve of the Battle of the Marne, and formed a new cabinet which was composed of stronger men and included even Socialists. The first steps of the new government were measures for the defense of Paris, which by this time was seriously threatened by the rapid German advance. For

this purpose General Gallieni, a capable and resolute soldier, was appointed military governor of Paris. But the military situation became so threatening that the government moved to Bordeaux, September 2, and returned to Paris only in December, 1914. When Parliament was re-opened in Paris on Dec. 22, 1914, Premier Viviani in a passionate address outlined the war aims of France, declaring that France would not "lay down her arms until she had avenged outraged right, regained forever the provinces ravished from her by force, restored to heroic Belgium the plenitude of her material prosperity and her independence, and broken down Prussian militarism." Soon the deputies manifested that they wished to be consulted as to the methods of realizing these aims and that they intended also to express freely their criticism of the government's conduct of the war. The parliamentary attacks were concentrated on the Ministry of War, which was then in the hands of Alexandre Millerand, and particularly on the Army Medical Service and on munitions supply, which the campaigns of 1914 and the early months of 1915 had proved to be sadly deficient. Millerand, however, withstood stubbornly all attacks and it was another factor, the failure of the Balkan policy, which caused the fall of the Viviani government on Oct. 22, 1915.

A new coalition government, with the motto "Peace Through Victory" was formed by Aristide Briand who gave ministerial posts to members of practically all political parties, inclusive of the Royalists and the Socialists. During the din of the battle raging around Verdun in the spring and summer of 1916 the deputies, acting upon reports of lack of provision in the defense of the fortress, demanded a secret session of Parliament for the discussion of both details regarding effectives and the responsibilities of general officers commanding in the field. Briand was forced to accede to this request and in consequence a very stormy session was held July 16-22, 1916. The Battle of the Somme and Rumania's entrance into the War on the Allied side, which was regarded as a great diplomatic success of the Briand cabinet, served to prolong the life of the government. In December, 1916, Briand reconstructed his cabinet by including a number of capable business men and by giving the Ministry of War to General Lyautey (q.v.), but when the Chamber shortly afterwards drove Lyautey from office and severely criticized Briand's economic policy the cabinet resigned, on Mar. 17, 1917. The succeeding ministry under Ribot differed from the outgoing ministry only in that it contained as Minister of War, a Radical-Socialist, Paul Painlevé, who on May 15, 1917, made important changes in the army command by appointing General Pétain Commander-in-Chief in place of General Nivelle and General Foch Chief of Staff at the War Office.

During the spring and summer of 1917 the seemingly interminable duration of the War and the terrible losses and sacrifices, coupled with grave economic troubles, seriously affected the morale of the French people and produced widespread war-weariness. The symptoms of this state of mind were "defeatism," industrial unrest, and mutinies at the front. Socialists increasingly took a stand of opposition to the War. Caillaux and other Radical-Socialist leaders who had always more or less openly op-

posed the French war policy were carrying on a campaign for a "White Peace," i.e. a peace without victory. The situation became so critical during the summer of 1917 that immediate energetic action seemed imperative to prevent a breakdown. During August Georges Clemenceau made a vehement attack in the Senate on Minister of the Interior Malvy for the way in which he had permitted the spread of defeatism and pacifism. This brought about the fall of Malvy on Aug. 31, 1917, and a week later that of the entire cabinet. Paul Painlevé, a Radical-Socialist, succeeded Ribot as Premier on September 12 and inherited his troubles. Upon the speedy fall of the Painlevé Ministry Clemenceau assumed office and began to clean the Augean stable of treason and of neglect. He abandoned coalition and the political dillydallying of his predecessors and declared that he would pursue but one policy, that of vigorously prosecuting the War. In pursuance of this policy he assumed, aside from the Premiership, the Ministry of War as the all-important cabinet post and filled his ministry for the most part with men who had been little before the public eye but stood out for ability and energy and were thoroughly faithful to his policy. He put a speedy end to the defeatist campaign by ordering the arrest of its more important leaders. At the end of 1917 the prosecution of Caillaux was ordered; the arrest of this former Prime Minister and leader of the great Radical-Socialist Party took place on Jan. 14, 1918. A series of treason trials followed now in rapid succession. The first case to come up before the Paris Court-martial was that of Bolo Pasha, an adventurer of low birth and a shady past, who had attempted to buy the *Journal* with German money and had also invested money in other newspapers for defeatist purposes. The trial resulted, Feb. 14, 1918, in a verdict of death for Bolo Pasha and of three years' imprisonment for his tool Parchère. Two weeks later the *Bonnet Rouge* trial began. Seven persons, including Duval, the editor of the *Bonnet Rouge*, a defeatist newspaper, and Leymarie, Malvy's secretary, were charged with complicity in commerce with the enemy. Upon overwhelming evidence Duval was condemned to death and the others to prison terms ranging from two to 10 years. Duval was executed a few days before the opening of public proceedings against Malvy on July 16, 1918. Malvy, a leader of the Radical-Socialist Party and a lieutenant of Caillaux, had been Minister of the Interior from 1914-1917 in five successive cabinets. In this capacity he had assisted Caillaux and his associates in their efforts to obstruct the prosecution of the War and to bring about an understanding with Germany. It was charged that by his failure to combat the enemy agents in France he had been guilty of negligence in office and had thus favored the cause of Germany and aided in bringing about the formidable mutiny which broke out among 118 battalions at the front subsequent to Nivelle's unsuccessful attack on the Chemin des Dames in 1917. The Senate, sitting as a High Court, dismissed Daudet's charge that Malvy had communicated Nivelle's plan of attack to the Germans, but found him guilty of having failed as Minister of the Interior to combat the plan to destroy the morale of the country and the discipline of the army, in other words of having

committed negligence equivalent to treason. The Court condemned him to five years' exile but without civil degradation. Malvy left immediately for Spain, protesting his innocence. Senator Charles Humbert, an influential member of the Military Committee of the Senate, Pierre Lenoir, and others were brought to trial before the Third Court-martial on Mar. 31, 1919, because of charges in connection with the purchase of the *Journal* with enemy money. Senator Humbert and Sadoux were acquitted, Lenoir condemned to death, and Desouches sentenced to five years' imprisonment. The final act of the treason drama, the trial of Joseph Caillaux, did not take place till the spring of 1920. Although he seemed to be at the bottom of the defeatist campaign and was suspected of having plotted to seize the government by a coup d'état and conclude peace with Germany, the High Court found Caillaux guilty on Apr. 23, 1920, of having had relations with enemy agents and of having given information of the greatest value to the enemy, but exonerated him of having guilty intentions. Caillaux was sentenced to two years' imprisonment, 10 years' loss of civic rights, and five years' residence within a district to be designated by the Court. Since he had served his term already, he took up his domicile in the assigned district, where, with consistency and with his admitted brilliance, he carried on a struggle to recover his former prestige.

The importance of the treason trials lies not so much in the sensational disclosures as to the existence of war-weariness, defeatism, and mutiny in France; or in the trial of former premiers, ministers, and senators, as in the fact that they mark the temporary conclusion of a struggle, started long before the War, between two great French policies. The one policy, led by Caillaux, aimed at peace and conciliation with Germany and on this basis at a concert of the continental European nations under French and German leadership. The other policy, led by Clemenceau, stood for a military victory over Germany, an Entente with England, and the fulfilment of French national aspirations, especially on the eastern frontier. Both Caillaux and Clemenceau were unscrupulous and determined in the pursuit of their policies. Caillaux had been slowly preparing the way for his success ever since the outbreak of the War. The climax came with the war-weariness and the mutinies following Nivelle's abortive attack on the Chemin des Dames early in 1917. It was then that Clemenceau made his great effort for the rooting out of all elements opposed to the most energetic prosecution of the War. The treason trials mark the victory of Clemenceau's policy over the Caillaux policy. Having disposed of the anti-war elements Clemenceau set to work organizing all energy in the country to prosecute the War. He refused to follow his predecessors in the policy of deceiving public opinion and stated to the country the sombre truth as to the military and political situation. He supplied the weakened army with new soldiers by drastically draining offices, factories and fields of dispensable manpower. At the same time he instituted rigorous measures to ensure an adequate food supply. His rationing system had not, however, the same success which similar measures had in Great Britain and Germany because of the disinclination of the French people to submit

to strict alimentary discipline. Clemenceau also dealt sternly with the Socialist and Syndicalist opposition which raised its head during the summer of 1918. French morale improved at once notwithstanding severe trials, such as the Parisians experienced during the bombardment and air raids in the spring and the summer of the last year of the War. If the desired end, military victory over Germany, was finally achieved it was in no small measure due to the iron rule of Clemenceau.

Immediately after the Armistice the politicians made a determined effort to reestablish the cabinet system and to divest Clemenceau of that one-man power which he had exercised during the War and which had enabled him to hold the country together till the final victory. In opposition to such designs Clemenceau made clear in the debates in the Chamber during November, 1918, that he had no intention of giving up his powers as peace-maker and that, outside of a general outline, he would not take the whole country into his confidence in regard to his peace policy. In this attitude he was sustained by the Chamber by a vote of 398 to 93. Clemenceau conducted the peace negotiations (see PEACE CONFERENCE) in secrecy, aided not by eminent French politicians but by his own faithful and trusted collaborators. This caused considerable resentment in Parliament. Moreover, able as Clemenceau had been as War Premier and as peace negotiator, he had failed in his economic and labor policies. Extremist agitation and the failure of the government to remedy economic distress, and particularly the high cost of living, brought about a number of serious strikes during the first half of 1919. When the Peace Treaty came up for discussion in the Chamber in September, 1919, the Left censured the spirit of harshness in which it had been conceived, while the Nationalist deputies maintained that it did not go far enough in providing France with security, especially since Germany was permitted to retain the left bank of the Rhine. A rejection of the Treaty being out of the question, it was finally ratified by 372 votes against 52.

Great interest centred in the elections of 1919, the first since 1914. With the aid of Alexandre Millerand, Clemenceau organized an electoral phalanx, the National Bloc, composed of the more conservative parties, to combat Socialism and Bolshevism. The elections to the Chamber, held on Nov. 16, 1919, resulted in a decisive victory for the National Bloc and in a defeat for the Socialists and the Radical-Socialists. The balance of power was shifted from the Left and the Left Centre to the moderate Centre and the conservative Right. Moreover, since the two parties which had hitherto opposed anti-clerical legislation, the Progressists and the Action Libérale, made the greatest gains, the election signified, for the time at least, a Catholic revival. It was quite evident from the results that the election was an expression of the spirit of the War and not of peace. The most important business before the new Parliament was the election of a successor to Raymond Poincaré as President of the French Republic. Clemenceau, though not eager, was induced to stand for election, but was defeated by Paul Deschanel in the Republican Caucus ballot which was held before the election. Thereupon the National Assembly chose Deschanel by 734 out of 888 votes on Jan. 17,

1920. On the following day the Clemenceau Ministry resigned and Alexandre Millerand formed a new cabinet, in the composition of which he followed Clemenceau's example of choosing men of practical experience rather than brilliant politicians.

The new government was soon called upon to deal with very serious strikes which began in February, 1920. These were caused by extremist sections in the French labor movement and were unpopular with the great mass of the French people; they failed disastrously by the end of May, dealing a severe blow to the *Confédération Générale du Travail*. The chief aim of the Millerand government was the application of the terms of the Peace Treaty, and toward this end Raymond Poincaré was appointed President of the Reparations Commission on February 20. The successive Conferences at Boulogne, Spa, and Hythe produced very few results. The unsatisfactory trend of the Reparations policy engendered no little discontent in Parliament and Millerand might have had to contend with very strong opposition had it not been for the success of his labor policy and of his Polish policy. In accordance with the French post-war policy of erecting Poland as a strong "buffer" state between Russia and Germany in order to prevent a union of interest between these two former Powers the Millerand government during the summer of 1920 gave successful aid to Poland in its struggle with Soviet Russia. The national approval accorded to this policy made, in conjunction with other factors, Millerand the logical candidate for the Presidency when President Deschanel was forced to resign on account of illness on Sept. 16, 1920. Millerand accepted the candidature and issued a statement declaring that, if elected, he would continue the same policy which he had pursued while Premier. He was duly elected on November 26 by 695 out of 892 votes and immediately thereafter let it be known that he intended to increase the powers of the presidential office and to assume a greater control over foreign affairs than his predecessors had done. A new ministry was formed by Georges Leygues, but this cabinet was clearly intended as a makeshift and gave way in the middle of January, 1921 to a cabinet under Aristide Briand.

The return to power of the parliamentary veteran Briand marked a revival of government by coalition and an attempt to modify the French Reparations policy and above all improve the somewhat strained relations with England. Ever since the Peace Conference there had been gradually increasing disagreement between France and Great Britain (q.v.) as to the application of the terms of the Treaty. The French interpreted the English counsel for moderation as an attempt to whittle down France's share after England had been fully indemnified by the German colonies, markets and ships. They reasoned, moreover, that the English could well afford to be lenient with the Germans since England as a result of the Allied victory had been secured against any possible German aggression, while France, situated on the continent, had to reckon with a rapid recovery of a neighbor possessed of great powers of recuperation. Whatever the merits of this contention were, it produced on the part of the French public and government a tenden-

cy to use the policy of the strong arm in continental European affairs and it brought discord into the Franco-British relations. This estrangement was also fostered by other points of divergence in policy, such as Franco-British differences in the Near East, notably in Syria: the conflict between the French pro-Turkish and the British anti-Turkish policy; the British negotiations for resumption of trade with Soviet Russia and the vehement opposition of the French to Soviet Russia because of the Poles and the Russian debt; the refusal of the British to follow the French in giving unconditional support to the Poles in the Danzig and Upper Silesian questions; etc. Briand made an earnest effort to remove the diplomatic friction between the two countries but from the outset he encountered the opposition of the conservative elements under the leadership of Poincaré. Further dissatisfaction in France was produced by the results of the Washington Conference at the end of 1921. (See *WASHINGTON CONFERENCE*) By virtue of the fact that this Conference concerned itself chiefly with problems of the Pacific, France was placed at this meeting in a position of less importance than either the United States, Great Britain, or Japan. The Agreement on Naval Limitation, subscribed to by Briand was felt to be disadvantageous to France. This discontent delayed the ratification of the Five Power Naval Treaty by France until July 7, 1923. The hostility toward Briand in the Chamber, resulting from what was considered his too conciliatory attitude, reached such intensity after the Cannes Conference, Jan. 6-12, 1922, that he deemed it best to resign (Jan. 12, 1922).

The reaction against Briand's policy brought Poincaré into office. The new Prime Minister stated from the outset that he preferred strong methods and the old diplomacy to conciliation and conferences and in consequence a distinct change for the worse took place almost immediately in Franco-British relations. Poincaré had inherited from his predecessor a pledge to attend the forthcoming Genoa Conference (Apr. 10-May 19, 1922), and, while refusing to go himself, he felt bound, in compliance with the obligation entered into by Briand, to send a delegation which was headed by Louis Barthou, the President of the Reparations Commission, as his personal representative. Owing to Poincaré's insistence that neither the Peace Treaty nor Reparations should be subject to discussion at the Conference, the Genoa meeting had at best only a moral effect. The Hague Conference, held in June of the same year, which was intended to be a continuation of the Genoa Conference, likewise ended in failure, since no agreement could be reached with the Soviets. In the Turkish question France found herself during 1922 often in a rather embarrassing opposition to Great Britain and it was only after the sweeping Turkish victory in August, 1922, that the two Powers recognized the harmful effects of their disagreement and arrived at more effective coöperation in regard to Turkey. But the Reparations problem, and the connected problems of the inter-Allied debts and of security for France, tended more and more to produce serious divergence of opinion between France and Great Britain, all the more so in view of Poincaré's reversion to strong methods at the close of 1922. At the conference with

Great Britain, held in Paris during the opening days of 1923, Poincaré announced his intention of seizing from Germany productive guarantees with the view of holding them till Germany fulfilled her obligations under the Peace Treaty. Accordingly French troops were ordered on Jan. 10, 1923, to occupy the Ruhr. (See REPARATIONS.) This action not only caused anger abroad and among France's allies, but also evoked protests from the Left groups in the French Chamber. When it came to a showdown, however, the Chamber, with the exception of the Communists and some of the Socialists, supported Poincaré in his venture. The Ruhr occupation involved a heavy drain on French resources and complicated still further the already very serious French financial situation. During his premiership Poincaré strove with zeal to consolidate French military supremacy by encouraging the afterward discredited Separatist movement in the Rhineland and by cementing France's relations with the Little Entente (q.v.). The French policy toward the latter aimed at the building up of a wall of defense for France out of the succession states which had been constructed by the Peace Conference on the ruins of the former three great Powers of the European continent. By rendering political, military, and financial assistance to these new states France bound them to her in close alliance and thereby sought to prevent the possible rise of these former Powers in challenge to her own hegemony on the European continent. Meanwhile the failure of Poincaré's Ruhr and Rhineland ventures and the comparative isolation of France among the Powers resulting from his policy had greatly diminished his popularity at home. Already during the summer of 1923 a number of by-elections had gone against the government and the Radical-Socialists and the Unified Socialists had formed the "Bloc des Gauches" for the purpose of offering a compact political organization in the forthcoming elections in opposition to Poincaré's and Millerand's "Bloc National." Moreover the Prime Minister was seriously embarrassed in the early spring of 1924 by a domestic crisis due to the dwindling of the value of the franc and the increase in the cost of living. Poincaré's proposal to meet the critical financial situation by an increase in the taxes amounting to 20 per cent, while a credit to his courage, did not improve his chances in the impending elections. In the face of strong opposition the government's tax bill was carried on Feb. 22, 1924. Poincaré took drastic measures to stop the continued fall of the franc but the currency crisis was not remedied until Morgan and Company stepped into the breach with a loan. All these measures were used by the opposition against Poincaré in the Chamber and in the constituencies. When defeated on March 26 on an unimportant issue Poincaré resigned but resumed office two days later with a reconstructed cabinet. In regard to the Dawes Report of Experts Poincaré after some hesitation signified his approval, but raised and left open the all-important question of "sanctions" in case of German default. He also refused to declare his willingness to evacuate the Ruhr. His attitude was, however, of less importance than formerly in view of the results of the elections on May 11, 1924, which indicated a defeat of the "Bloc National" by the "Bloc des

Gauches." The composition of the new Chamber was as follows: Conservatives 11; Republican Entente 137; Left Republicans 92; National Radicals 34; Radical Socialists 127; Independent Socialists 39; Unified Socialists 101; Communists 29. The government strength was roughly 274, while the opposition was able to muster at least 296.

The radical opposition immediately brought strong pressure to bear against Poincaré and Millerand. They aimed not only at the fall of the Poincaré government, which was a foregone conclusion, but at the resignation of President Millerand as well. They charged the President with having gone outside the non-partisan sphere within which the President of the French Republic is confined by tradition and the spirit of Republican French government. The chief reason for their opposition to Millerand was, however, the fact that the latter was, in conjunction with Poincaré, the mainstay of the nationalist policy inaugurated by Clemenceau during the War. Upon the assembling of the Chamber on June 1 the Poincaré government stepped out of office. Determined opposition, however, was encountered from President Millerand, who was not willing to relinquish his office without a serious fight. A tense parliamentary crisis ensued in consequence. Millerand attempted to gain time by appointing the stop-gap cabinet of François-Marsal, on June 8, but the radical opposition, which numbered by this time 307 deputies, would have no relations with it and forced it out on June 10. A message of the President was met by a vote of 329 to 214 in the Chamber and of 154 to 144 in the Senate in favor of the technical motion to adjourn all discussion of the message, whereupon President Millerand resigned his office on June 11. On June 12 the moderate Radical-Socialist Doumergue, President of the Senate was elected President by 515 votes against 309 for the more advanced Radical-Socialist Painlevé, President of the Chamber, and two days later Herriot formed a Radical-Socialist cabinet. Since the Radical-Socialist Party, the Party of Caillaux, was now in power, supported by the Socialists, and since the new Premier had been Caillaux's successor as the leader of this party, the change in the French government may reasonably be regarded as a step in the direction of the policy of Caillaux. This development was signified by the immediate passage of an Amnesty Bill with specific clauses granting amnesty to Caillaux and Malvy. Any rapid and complete overturn of French policy in consequence of the kaleidoscopic events in French parliamentary affairs during the late spring and the early summer was precluded, however, by the rather precarious position of the new government. Its majority depended entirely on the whole-hearted support of the Socialists and even with the aid of the latter its majority was a very narrow one in face of the large Nationalist Bloc in the Chamber. As a result the Herriot government had to take into consideration the wishes of the Nationalists and could not at once abandon the Poincaré policy entirely. On the whole the "Bloc des Gauches" stood for complete accord with England, a betterment of Franco-German relations through conciliatory methods on the part of France, for international action as over against isolated French action in regard to

Reparations, and against the occupation of the Ruhr.¹ The dependence of the government on the Nationalists was amply manifested by the Premier's attitude in his conference with Poincaré, Macdonald and during the London Conference in July, 1924, which deliberated on the application of the Dawes Report. Under pressure from the Nationalists Herriot, in spite of his admitted conciliatory attitude, defended the French claim to impose "sanctions" in case of German default, opposed the admission of German delegates on an equal basis with the Allies and the immediate evacuation, military and economic, of the Ruhr, and reaffirmed the contention of former Premiers Briand and Poincaré that the 15 year period of occupation in the Rhineland could not be considered to have begun until the Germans had made substantial payments on Reparation accounts. His stand on these questions was, however, generally interpreted as being a temporary concession to the large Nationalist minority in the Chamber. At the end of July it was reported that the London Conference had reached a thorough understanding on the questions of the application of the Dawes Report and that a compromise had been effected between the French and Anglo-American viewpoints whereby adequate machinery would be provided to deal with a possible German default. This report, if substantiated, would indicate that in the future isolated French action against Germany will be superseded by common action on the part of the Powers, and in the last analysis it would mean a victory of the French moderates over the intransigents led by Clemenceau, Poincaré, and Millerand. See also the following articles: FRENCH LITERATURE; SCULPTURE; NAVIES OF THE WORLD; RHINELAND; SAAR BASIN; PEACE CONFERENCE AND TREATIES.

FRANCE, ANATOLE (1844-1924). A French novelist (see VOL. IX). In 1914 he published *La Révolte des Anges* (*The Revolt of the Angels*), and later *Ce que Disent Nos Morts* (1916), *On Life and Letters*, Series IV (1924), and *The Latin Genius* (1924), translated by Wilfrid Jackson. In October, 1920, he married Mlle. Emma Leprevotte. He received the Nobel Prize in literature in 1921.

FRANCIS, DAVID ROWLAND (1850-1927). An American merchant (see VOL. IX). He became United States Ambassador to Russia in 1916, but returned to the United States when the Bolsheviks overthrew the Czar's government.

FRANCK, HARRY ALVERSON (1881-). An American traveler and author, born at Munger, Mich. He studied at Michigan, Columbia, and Harvard Universities in this country and did graduate work abroad. His travels, interrupted now and then by periods of teaching, have taken him to South America (1911-15), the West Indies (1919-20), and the Orient (1922-). He is the author of *A Vagabond Journey around the World* (1910), *Four Months Afoot in Spain* (1911), *Tramping through Mexico, Guatemala, and Honduras* (1916), *Vagabonding down the Andes* (1917), *Vagabonding through Changing Germany* (1919), *Working North from Patagonia* (1921), and others.

FRANCKE, KUNO (1885-). A German-American scholar and author (see VOL. IX).

¹ In internal affairs it favored chiefly reduction of the taxes and of military service and a resumption of anti-clerical legislation.

He became professor emeritus and honorary curator at Harvard in 1917 and was president of the Modern Language Association of America (1917). He wrote *A German-American Confession of Faith* (1915), *The German Spirit* (1916); *Personality in German Literature before Luther* (1916); *Die Kulturweite der Deutschen Litteratur von der Reformation bis zur Aufklärung* (1922), and *Die Kulturwerke der Deutschen Litteratur in Ihrer Geschichtlichen Entwicklung* (1923).

FRANK, GLENN (1887-). An American author and editor, born at Queen City, Mo., and educated at Kirkeville State Normal School and at Northwestern University (1912). In 1921 he became editor-in-chief of the *Century Magazine*. He published *The Politics of Industry* (1919) and is co-author of *The Stakes of the War* (1918), and *The League of Nations—The Principle and the Practice* (1919).

FRANK, REINHARD (1860-). A German jurist and Privy Councillor, born at Reddighäuser Hammer, and educated at the universities of Marburg, Munich, and Kiel. In 1887 he became lecturer at Marburg, and subsequently held professorships at Gießen (1890), Halle (1900), Tübingen (1902), and Munich (1914). In 1920-21 he was rector of the University of Munich. His numerous publications include *Wollfsche Strafrechtsphilosophie und ihr Verhältnis zur Kriminalpolitischen Aufklärung im Achtzehnten Jahrhunderts* (1887); *Naturrecht, Geschäftliches Recht und Soziales Recht* (1891); *Strafrechtliche Fälle zu Akademischem Gebrauch*, 5th ed. (1912); *Schutzstrafe und Vergeltungsstrafe* (1908); *Die Belgische Neutralität* (1915); *Kann Wilhelm II Ausgeliefert Werden?* (1919); and *Sinn und Tragweite des Auslieferungsgesetzes* (1920). He became editor of the *Vergleichende Darstellung des Deutschen und Ausländischen Strafrechts* and the *Pitaval der Gegenwart*. He was also made a member of the *Kommission für das Strafgesetzbrauch*.

FRANKFURTER, FELIX (1882-). An American lawyer and educator, born in Vienna, Austria. He came to the United States in 1894 and in 1902 graduated from the College of the City of New York. He studied law at Harvard and from 1906 to 1910 was United States Attorney of the Southern District of New York. From 1914 he was professor of law at the Harvard Law School. During the War he acted as major and judge-advocate, and as secretary and counsel of the President's mediation commission. In 1918 he was appointed chairman of the War Labor Policies Board. He was also a member of the board of directors of the Institute for Government Research, and was the author of *Cases Under the Interstate Commerce Act*.

FRANKLIN-BOUILLON. See TURKEY.

FRANKLIN, EDWARD CURTIS (1862-). An American chemist, born at Geary City, Kan., and educated at the University of Kansas, in Boston, and at Johns Hopkins. He was an assistant in chemistry at Kansas, where in 1899 he attained the chair of physical chemistry. In 1903 he was called to the associate professorship of organic chemistry in Leland Stanford Junior University, where in 1906 he became full professor. Dr. Franklin has had other scientific connections, notably that of professor of chemistry with the hygienic laboratory of the United States Public Health Serv-

ice (1911-13), physical chemist of the Bureau of Standards (1918), and similar posts with other government advisory boards. His original investigations have had to do with liquid ammonia as an electrolytic solvent, the ammonia system of acids, bases, and salts, and various other preparations of which ammonia is an important constituent. These for the most part have been published in the *American Chemical Journal* or the *Journal of the American Chemical Society*. He was chosen president of the American Chemical Society in 1923.

FRANKLIN COLLEGE. An institution at Franklin, Ind., founded in 1834. The number of students increased from 206 in 1914 to 400 in 1924, the faculty rose from 14 to 27 members, and the library increased from 19,100 to 26,048 volumes. The endowment increased from \$312,500 to \$800,000 during the same period, and the total income from \$49,498 to \$155,970. Departments of Biblical literature, sociology and economics, and art were established. A campaign was begun to raise \$250,000 for buildings. C. E. Goodell succeeded E. A. Hanley as president.

FRANZ, SHEPHERD IVORY (1874-). An American psychopathologist (see Vol. IX) attached to the United States Government Hospital for the Insane. After 1914 he edited the *Psychological Bulletin* and was associate editor of *Psychobiology*. He was appointed member of the psychology committee of the National Research Council in 1917 and served as president of the American Psychological Association for the year 1920.

FRANZ, WILHELM (1859-). A German professor of English philology at Jena and Tübingen. His works include *Die Grundzüge der Sprache Shakespeares* (1902), *Orthographie, Lautgebung und Wortbildung in den Werken Shakespeares* (1905), *Shakespeares Grammatik* (1909), *Die Treibende Kraft im Werden der Englischen Sprache* (1906), *Der Wert der Englischen Kultur für Deutschlands Entwicklung* (1913), *Britanien und der Krieg* (1915), *Shakespeare als Kulturkraft in Deutschland und England* (1916), *Die Feindschaft der Angelsachsen* (1917), and *Deutsche Empfindung im Kampf mit Angelsächsischem Kriegswillen* (1918).

FRAZER, SIR JAMES GEORGE (1854-). A British anthropologist and folklorist (see Vol. IX). His work, *The Golden Bough*, originally published in 2 volumes in 1890, rewritten and expanded to 12 volumes (1911-15), was republished in an abridged edition in 1922. He is also the author of *Folklore in the Old Testament* (1918); and *Sir Roger de Coverley and Other Literary Pieces* (1920). He published *Apollodorus*, with an English translation (1921).

FAZER, JOSEPH CHRISTIE WHITNEY (1875-). An American chemist and educator, born at Lexington, Ky. He graduated from the Kentucky State University in 1897 and took postgraduate courses at Johns Hopkins. From 1901 to 1907 he was assistant and associate in chemistry at that university, and from 1907 to 1911 was chemist at the United States Bureau of Mines. From the latter date he was professor of chemistry at Johns Hopkins, and from 1921 was also B. N. Baker professor.

FREDERICK, PAULINE (MRS. C. A. RUTH-

ERFORD) (1885-). An American actress, born in Boston. She made her debut in New York in 1902. She played in many Broadway productions including *Innocent* and *Don't Shoot* and made her screen debut in *Mrs. Dean's Defense*. She later appeared in film versions of *Zaza*, *Tosca*, *The Woman on the Index*, *Bonds of Love*, *The Paliser Case*, *Madame X*, and *The Glory of Clementina*.

FREDERICQ, PAUL (1850-1920). A Flemish historian (see Vol. IX). The German government exiled him from Belgium during the War because of his activity in strengthening the morale of the Belgians. After the Armistice he was appointed rector of Ghent University, but weakness from imprisonment caused his death. He was a member of the Académie Royale de Belgique and the Académie des Pays-Bas.

FREE BAPTISTS. See BAPTISTS, FREE.

FREE VERSE. See LITERATURE, ENGLISH AND AMERICAN.

FREEMAN, EDWARD MONROE (1875-). An American botanist, born at St. Paul. He graduated from the University of Minnesota in 1898 and did graduate work there and at Cambridge. He became professor of botany and plant pathology at the University of Minnesota in 1908 and has been dean of the College of Agriculture, Forestry and Home Economics at that university. Professor Freeman is the author of *Minnesota Plant Diseases*.

FREEMAN, LEWIS RANSOME (1878-). An American author, born at Genoa Junction, Wis., and educated at Leland Stanford Junior University. He has spent much of his time in traveling and as foreign war correspondent, with the British, French, and Italian armies (1915-17) and in Germany (1918). He wrote *Many Fronts* (1918), *Stories of the Ships* (1919), *Sea Hounds* (1919), *To Kiel in the Hercules* (1919), *In the Tracks of the Trades* (1920), *Hell's Hatches* (1921), *The Yellowstone to New Orleans* (1922), *When Cassi Blooms* (1922), and other books.

FREEMAN, ROBERT (1878-). An American clergyman, born in Edinburgh, Scotland. After engaging in mission work in Pennsylvania and New York for four years, he was ordained in the Baptist ministry in 1900; thereafter he held various pastorates until 1910. He was moderator of the Synod of California in 1920-21. During the War he directed the first expeditionary division of the Y. M. C. A. and in 1917-18 was director of religious work in France. Other offices which he has filled are director of the San Francisco Theological Seminary and trustee of Occidental College. He is author of *The Hour of Prayer* (1914) and *The Land I Live In* (1921).

FRENCH, DANIEL CHESTER (1850-). An American sculptor (see Vol. IX). He was awarded a medal of honor at the Panama Pacific Exposition, in 1915, and a gold medal of honor by the National Institute of Arts and Letters, in 1918. From 1910 to 1915 he was a member of the National Commission of Fine Arts. His output during 1914-24 was as astonishing in quality as in quantity. It includes "Sculpture" (marble, St. Louis Museum); figures symbolic of Manhattan and Brooklyn on Manhattan Bridge; "Memory" (marble, Metropolitan Museum, New York City), his finest female nude; a statue of Lafayette, Easton, Penna.; the Dupont fountain, Washington, D.

C.; and especially, a colossal bronze Lincoln for the Lincoln Memorial at Washington

FRENCH. JOHN DENTON PINKSTONE (1852-1925). A British field-marshal (see Vol. IX). He commanded the English forces in France from the beginning of the War till the end of 1915. His operations were hampered until the last three months by lack of artillery ammunition. He resigned in December, 1915, and was made Viscount French of Ypres and High Lake. He was then made commander-in-chief of the United Kingdom, holding that post till May, 1918, when he was appointed Lord Lieutenant of Ireland. He resigned in 1921 and was made an earl on returning to England. See WAR IN EUROPE, *Western Front*.

FRENCH EQUATORIAL AFRICA. A French possession in west central Africa comprising the colonies of Gabon, Middle Congo, Ubangi-Shari, and Chad. Its area is estimated by the French at 982,040 square miles, excluding the Cameroon (q.v.), of 166,480 square miles, which forms a separate colony joined to Equatorial Africa. By the census of 1921 it had a population of 2,845,936, of whom 1932 were whites. The largest cities had the following populations: Libreville, 20,000; Brazzaville, 40,000; Fort Lamy, 10,000. The tropical products continued the sources of economic wealth. Caoutchouc, lumber, ivory, palm kernels, palm oil, were the principal exports in 1921. Coffee and cacao were beginning to receive attention. Large herds of cattle, sheep, camels, horses, and ostriches were the property of the natives, but the lack of transportation eliminated them from the export trade. In 1920, total exports were 23,524,154 francs as compared with 21,181,768 francs in 1913. Imports in 1920 were 8,807,612 francs as compared with 21,181,768 francs in 1913. The fall of the franc after the War made the actual decrease in trade greater. The territory still lacked railroad communication in 1921. In February, 1921, a line was commenced from Brazzaville to the Atlantic ocean (300 miles). The general budget in 1922 called for an expenditure of 9,358,542 francs. The four colonial budgets included expenditures of 15,673,000 francs. Deficits were characteristic of the period 1912-22, in 1922 a subvention of 4,000,000 francs being necessary for administrative purposes. Colonization continued tardy because of the difficulties of transport. To hasten the country's settlement, the French Chamber passed, in 1920, a measure calling for the expenditure of 171,000,000 francs on railway, port, road, telegraph, and river developments.

FRENCH ESTABLISHMENTS IN INDIA. Five provinces in India belonging to the French empire. These were Pondicherry (170,785 inhabitants in 1921), Karikal (53,583 population), Chandernagore (25,119 population), Mahé (11,218 population), Yanam (4683 population). Total area, 196 square miles; total population, 265,388. Chief towns were: Pondicherry (46,605), Oulgaret (22,307), Villenour (21,033). Principal products were rice, sugar cane, cotton, manioc, cacao, coffee, groundnuts. Imports in 1920 were 25,583,190 francs; in 1913, 10,837,115 francs. Exports for 1913, 1920, 1921, were 43,720,095 francs, 24,554,280 francs, 23,905,649 francs. The budget for 1922 was 2,630,170 rupees.

FRENCH ESTABLISHMENTS IN

OCEANIA. See PACIFIC OCEAN ISLANDS, *Society Islands*.

FRENCH INDO-CHINA. The general name for the French possessions in southeast Asia. It is made up of the following units: (1) Colony of Cochinchina, 22,000 square miles; population in 1921, 3,795,613, of which 7469 were Europeans; largest city, Cholon, 93,947 population; (2) Protectorate of Annam, 39,758 square miles; population in 1921, 5,637,751, of which 1642 were Europeans; largest city, Binh-Dinh, 74,400 population; (3) Protectorate of Cambodia, 57,900 square miles; population in 1921, 2,462,585, of which 1368 were Europeans; largest city, Pnom-Penh, 74,643 population; (4) Protectorate of Tonking, 40,530 square miles; population in 1921, 6,850,453, of which 6332 were Europeans; largest city, Hanoi, 73,948 population; (5) Protectorate of Laos, 96,500 square miles; population in 1921, 818,755; largest city, Vien-Tiane; (6) Kwangchow Wan territory, 190 square miles; population, 182,371; (7) Territory around Battambang, population 500,000. Total area, 256,878 square miles; total population in 1921, 19,747,528 (18,000,000 estimated in 1914); number of Europeans, 23,700. The activities were largely agricultural, the country being one of the most important rice districts in the world. Cinnamon, sugar, and tea were also grown in central Annam. Minerals mined were coal and lignite, antimony, tin, wolfram, iron, and zinc. Cotton was becoming important in Cambodia. In 1922, total exports were \$115,700,000 of which 80 per cent was rice; other exports were fish, pepper, hides, coal (almost 1,000,000 metric tons in 1922), cotton, rubber, and sugar. Exports in 1913 totaled \$69,051,800 (conversions made at current rate; the franc was worth \$0.09 in 1922). Imports in 1922 were \$96,900,000 as against \$61,247,600 in 1913. Leading imports were cotton tissues, cotton thread, iron and steel, machinery, and mineral oils. Imports in 1922 were furnished in the following proportions: France, 40.5 per cent; Hongkong, 29 per cent; Singapore, 6 per cent; England, 3 per cent; China, 3.6 per cent, United States, 1.7 per cent; India, 10 per cent. Exports in 1922 were taken in the following proportions: France, 17.3 per cent, Hongkong, 40 per cent; Dutch East Indies, 12 per cent; Singapore, 7 per cent. It was evident that for the first time France was approaching the British Empire in the question of trade. The United States, the Philippines, and Cuba were large purchasers of rice.

In 1922, 775 ships of 1,576,287 metric tons entered the port of Saigon, Cochinchina. Other ports, though of less importance, were Tourane (Annam), Haiphong (Tonking) and Kwangchow Wan. Railways in 1922: 1293 miles (no building since 1914). The general budget for 1921 balanced at 54,878,400 piastres (1 piastre = \$0.52), though excesses, never less than 7,000,000 piastres, occurred annually. The debt of Indo-China in July, 1922, was 383,494,000 francs. Local budgets for the separate areas totaled 71,647,310 piastres in 1923. Money in circulation Sept. 30, 1923, 89,562,408 piastres.

The French colonial policy was consistently enlightened. In 1918 and 1920, new codes of law were promulgated while educational progress steadily made headway. In 1917, the various technical and professional schools were

united to form the University of Indo-China and in 1918, a European college was opened at Hanoi. During the War, France was able to draw upon the region for troops, money, boats, provisions, and raw materials.

FRENCH LITERATURE. The changes in the field of French Literature during the decade 1914 to 1924 can be concretely illustrated by the following tables.

In 1911, V. Giraud, in his *Maîtres de l'Heure*, mentions these eight leaders of French thought: Loti, Brunetière, Faguet, de Vogüé, Bourget, Lemaître, Rod, France. One must add Maeterlinck and Bergson.

In 1914: drop Rod (inherited from time of realism), Vogüé (identified with Russian literature invasion); Faguet loses, Brunetièreism is absorbed by others; France is practically out. Retain Loti (Exotism), Lemaître (Nationalism), Bourget (Catholic philosophy); Bergson and Maeterlinck (Intuitionism). Add: Barrès and Maurras; Péguy and Psichari; Claudel and Jammes; Régnier and Verhaeren; Romain Rolland; André Gide; and, if you consider the quantity of readers, Henri Bordeaux.

In 1918: drop Faguet, Lemaître (dead), Loti, Psichari; Bergson and Maeterlinck. Keep: Bourget, Barrès, Maurras; Péguy, Claudel, Jammes (all, with variations, being traditionalists); Romain Rolland, *plus* Barbusse (who won notice by his impracticable pacifism); André Gide, *plus* Rivière and Thibaudet (adogmatic intellectualists); H. Bordeaux. Add no one.

In 1924: drop Romain Rolland, Barbusse. Keep Barrès, Bourget, Maurras; Péguy, Claudel, Jammes; Gide, Rivière, Thibaudet, and Bordeaux. Add: Proust; Dorgelès; Carco; Giraudoux (?), Morand (?); Lasserre (?); Benjamin Crémieux (the solid critic of the *Nouvelles Littéraires*).

From this, it is easy to see that Varillaud and Rambaud's *Enquête sur les Maîtres de la jeune Littérature* (1923), which turns in favor of Bourget, Barrès and Maurras, is not representative; at the same time it shows the persistence of the ideas represented by those three men; the two last are brothers in arms (and so is H. Bordeaux) of Bourget who still remains from the list of 1911. Now let us enter into some details. There are three periods to study: the pre-war, the war, and the post-war period.

Pre-War Period. Seven months only, during which the movement started during the preceding decade continued normally, namely: away from dilettantism, æstheticism, skepticism and cynicism, towards social reform, national traditionalism, and Catholicism. The following books might be remembered as particularly telling. In poetry Ch. Péguy's *Eve*. In prose M. Barrès's *Grande Pitié des Eglises de France*; and in prose fiction, Juliette Adam's *Chrétienne*—to refute her own *Païenne* of some years before; E. Bauman's *Le Baptême de Pauline Ardel*. Pierre Hamp continues his series *Peine des Hommes* by *Enquête* (about the various trades in France). Lichtenberger's *Le Sang Nouveau*,—the blood of those who are going to win the war. J. des Gâchons, *Vive la Vie!* On the stage Claudel scores once more, with *L'Otage*, of the most consistent Catholicism; while Curel, *Devant le Miroir*, and Croisset in *L'Épervier* describe the hypersensitive soul of the generation. Sacha Guitry cultivates the

tone of indifference still dear to some then, and which he is going to keep up all through the War.

War Period. It will start at once on Aug. 3, 1914, but will not stop altogether in 1918; indeed war publications were coming in even in 1924 and promising to continue indefinitely. With the first cannon shot all literature, including periodical literature, stopped for several weeks except only the *Revue des Deux Mondes*, *L'Illustration*, and *Revue Hebdomadaire* (the latter in form of a newspaper); and *Le Temps*, *Les Débats*, *Le Matin*, *L'Echo de Paris*—but they contained articles from the pens of masters, like Barrès (*Echo de Paris*), Maeterlinck, Lavedan, Doumic, Gourmont, Maurras, Masson-Forestier, etc.

Promptly, as soon as the rear was somewhat reorganized, this war prose came out in book form. Some of the most noteworthy of these collections of articles are: Barrès, the series *L'Âme Française et la Guerre* (*Union sacrée*, *Saints de France*, *Crow de Guerre*, etc.); Lavedan, *Grandes Heures*; A. France, *Sur la Voix Glorieuse*; Loti, *La Grande Barbarie*; Maeterlinck, *Débris de Guerre*; P. Adam, Maurras, Abbé Wetterlé; the Socialist Hervé (*Après la Marne*, *La Patrie en Danger*). Tinayre, *La Teillée des Armes* will remain as one of the fine books of the great first hours of the War. Then in 1915 Romain Rolland published in book form his much resented *Au-Dessus de la Mêlée*, of Tolstolian inspiration. In the course of the year 1915, the first soldier diaries began to appear, preceded by the gallant, but hardly very trustworthy volume of fiction *Gaspard*, by René Benjamin. One after the other they came out, especially in 1916, these books which will remain as a stirring testimonial to the horrors of the great War: Paul Lintier, *Ma Pièce* (followed by *Tub 1233*); *Lettres d'un Soldat* (by the painter Lemercier, but published anonymously); Rédier, *Méditations dans la Tranchée*; Genevoix, *Sous Verdun*; Dupont, *En Campagne*; Major Henches, etc. Hugues LeRoux published the story of his son *Au Champ d'Honneur*. The year 1917 is again very rich: Jean des Vignes Rouges's *Bourru*, *Soldat de l'auquois* is one of the notable war books, and the same year the much discussed *Le Feu* came out, written by Barbusse. (The chief objection to it in France was that it was spreading discouragement at a time when all needed so much courage.) M. Berger, *Le Miracle du Feu* will also remain as one of the best war books; and even more so Adrien Bertrand's *Appel du Sol* (which was awarded the Prix Goncourt—awarded also to R. Benjamin and to Barbusse). Marcel Nadaud's *Chignole* is a remarkably alert account of military aviation. The year 1917 was also the year of Duhamel's *Vie des Martyrs* (later followed by *Possession du Monde*, the Goncourt prize for 1918), the author tells of the heart-breaking scenes he witnessed as a major in hospitals near the firing line. As the struggle lasts the diaries become more pathetic, more shocking, sometimes harder in their moral appreciations of events. We will just give a few names here and refer for titles to the bibliographies named below: Dieterlen, Péricard, Le Bail, Dupont, Tuffrau, Belmont (*Lettres*) Erlande, Milan, Franconi, Binet-Valmer, Grimauty, Julia, Grandvilliers, Malherbe (Goncourt prize 1917 for *Flamme au Poing*), Fribourg (*Croire*), Giraudoux, Fonck, Pirenne, a Bel-

gian (*Fainqueurs de l'Yser*). The volumes of the Brothers Tharaud, *La Kelève* and *Randonnée de Samba Disuff*, deserve a special mention here; so does Y. (Larrouy)'s *Odyssée d'un Transport torpillé*. The fourth year of the war is at hand, and the diaries become less numerous, but often more bitter, e.g. Léon Werth (*Clavel soldat*), M. Berger (*Jean Darboise, auxiliaire*), Barbusse (*Clarté*); and, after the Armistice, what in the opinion of many remains the best war book: Dorgelès, *Croix de Bois*. Some sad stories are told by Zavie, *Prisonnier en Allemagne*, Hennebois, *Journal d'un Grand Blessé*, Blanche, *En Représailles*, Max, *Mes Six Erasons*.

Here must be added a reconstitution of the phases of the war by Dumur, in his trilogy in Zola style: *Nach Paris, Boucher de Verdun, Les Défaitistes*. Books not dealing directly with the War and the army, and yet remarkable, are: Isabelle Rimbaud, *Dans le remous de la bataille*; Donnay, *Lettres à une Dame Blanche* (Red Cross); Géraldy, *La Guerre, Madame . . .* (one of the most widely read for some time); Blanche, *Cahiers d'un Artiste* (a diary at the rear). Pierre Hamp will tell us of *Les Métiers Blessés* in consequence of the ruthless destructions by the enemy. In 1818, the poet H. Ghéon gave the story of his conversion in *L'Homme né de la Guerre*. A witty picture of the English in France during the War was given by André Maurois, *Les Silences du Colonel Bramble*.

Among the books which relate war achievements and which betray distinct literary value a few must be retained here: Le Goffic, a series of volumes the first of which is *Dixmude, un chapitre de l'Histoire des Fusiliers marins*; H. Bordeaux, *Les Derniers jours du Fort de Vaux*, and *Les Prisonniers déliés*. Jean de Pierrefeu (who gave out the daily war bulletins), *Au G. Q. G. (Grand Quartier Général)*; M. A. Leblond, *Galliéni*; then Bédier's sober and impressive *L'Effort Français*, and Madelin's *Verdun*.

Of books of more recent years, and which continued to stir the public, let us mention: in 1920, Parmentier's *L'Ouvrage*; in 1921, Cl. Aret's *Quand la Terre trembla*; and in 1923 R. Dorgelès's *Le Réveil des Morts* which contributed much to call attention to the improvements that could be made in the work of reconstruction in the devastated regions.

Of the novels which without depicting actual war episodes, take the War as background, these are a few samples: Prévost, *Adjudant Benoît*; Rosny, *L'Enigme de Givreuse* (a case of double personality in a soldier); Bazin, *Les Nouveaux Oberlé*; Estaunié, *L'Appel de la route*; Romain Rolland, *Clérembault*. From minor authors: Villetard, *Monsieur Bille dans la Tourmente*; Ch. de Rouve, *Française du Rhin*; Foley, *Sylvette et son Blessé*; Jeanne Landre, *L'Ecole des Marraines*; Colette Yver, *Mirabelle de Pampelune* (and other stories), *Les Cousins Riches* (the Americans); Marcel Boulenger, *Charlotte en guerre*. Some humorous stories: De la Foucardière, *Scipion Pégoulade* (a sort of Tartarin de Tarascon); M. Prévost, *Mon cher Tommy*; Boissière, *L'Étravagant Teddy de la Croix Rouge anglaise*; Dekobra, *Sammy, Volontaire Américain*; Valmy-Baisse, *Le Retour d'Ulysse*.

Short stories were published in fabulous number: *Contes véridiques des Tranchées*, by

many "poilus"; then collections by Arnoux, Bazin, Bordeaux, Farrère, Gus-Bofa, Frapié, Mille, etc., etc.

The theatre of the war period is not extremely important. At first, old plays exalting devotion to the mother-country provided what was needed. Corneille's *Horace*, Sophocles's *Œdipe roi*, Bornier's *Fille de Roland*, Sardou's *Patrie*, Kistemaker's *Flambée*, Lavedan's *Service*. Then early in 1915 new plays began to appear: Fronson's *Kommandantur*, depicting the invasion of Belgium (Fronson is a Belgian); Donnay's charming *Impromptu du Paquetage*; Claudel's *Nuit de Noël*; E. Morand's *Les Cathédrales*, spectacular mourning over especially Rheims and Strasbourg. In 1916, Bataille gave an unpleasant description of the effect of war on women in *L'Amazone*; while Hennique and Veber offered a cheerful two-act vaudeville *Le Poilu*. In 1917 came Bernstein's *Élévation*, hailed by many even down to 1924 as the best war play produced; Porto-Riche gave his realistic *Marchand d'Estampe*; F. Porché, his ingenious and very successful allegorical *Les Butors et la Finette*; Farrère and Népoty offered *La Veillée des Armes*. In 1918, there were two good plays again: Kistemaker, *Un Soir au front*, and Maeterlinck, *Bourgeois de Stilemonde* (which was first represented in America). In 1920, the exquisite *Maison de Dieu* by Fleg; the opportune (or inopportune) *Les Américains*, by Brioux; and the two plays—both painful for different reasons—Donnay, *Chasse à l'homme*, and Méré's *Les Captives*. In 1922, F. de Curel scored with *Terre Inhumaine*.

In the domain of poetry again relatively few collections can be recorded as absolutely above par. It would not be right to leave unnoticed Botrel's *Chants de Rosalie* ("Rosalie" was the bayonet), *Chants du Bivouac*, *Chants de Route*; he was called the "bard" of the trenches. Then: Claudel, *Trois Poèmes de Guerre*. In 1916, Bataille, *La Divine Tragédie*; Zamacois *L'Ineffaçable*; Paul Fort, *Poèmes de France*; and especially Verhaeren, *Les Ailes Rouges de la Guerre*. In 1917 the exquisite *Couronne douloureuse*, by H. Ghéon; and two of the most popular productions—rightly so—L. Mercier, *Prières de la Tranchée*, and the instantly famous jewel *La Passion de notre Frère le Poilu*. Champsaur's *L'Assassin Innombrable* is quite extraordinary, and even more so is, in 1918, Apollinaire's *Calligrammes, Poèmes de Paix et de Guerre*. The same year came out the very striking poems, *Nous . . . de la Guerre*, by Henry-Jacques; and Mme. Delarue Madrus, *Souffles de Tempête*. In 1919, Rostand's *Vol de la Marseillaise*; and J. Suberville's strong *Fibre de Bernadoux*, and *Fosse aux Lions*. In 1921, F. Porché republished with other poems his *L'Arrêt sur la Marne* (in the collection *Commandements du Destin*), and Suberville, *Le Soldat Inconnu*, which won for the author the Grand Prix de Poésie. In 1922, Henry-Jacques had another collection of his original poems *Symphonie Héroïque*. See the anthology of the war poets, Prévost and Dornier, *Le Vivre épique*.

For bibliography on the literature of the War, see: Baldensperger, *Avant-guerre dans la Littérature*; Jean Vic, *La Littérature de la Guerre*; Albert Schinz, *French Literature of the Great War* (New York, N. Y.). For military slang, the best book is Esnault, *Le Poilu*

tel qu'on le Parle. Bearing on the question of language in post-war Europe, see Meillet, *Langues de l'Europe nouvelle* (1918).

Post-War Period. Just as the war literature did not stop on Nov. 11, 1918, so did the post-war literature not begin at this date exactly; as early as 1917 there is a distinct tendency on the part of some writers to ignore the monstrous accident of the war.

Poetry. Some volumes from 1917 to the end of 1923 which cannot be passed without mention, if it were only on account of the fame of the authors, are: Rostand, *Cantique de l'Aigle* (posthumous); Gérard Rosemonde (Madame Rostand), *Pipeaux* (crowned by the French Academy); H. de Régnier, *Vestigia Flammæ*; Comtesse de Noailles, *Forces Éternelles*; Claudel, *Messe de Lâ-Bas*; Fr. Jammes, *La Vierge et les Sonnets*, Paul Fort, *Ballades Françaises* (continuation); Jules Romains, *Europe*, and *Puissances de Paris*. Among the best known of the poets of the new generations are Paul Valléry, Supervielle. To get an idea of the extra-modern poetry, see Paul Morand, *Lampes à Arc*; and the cubists and dadaists, Blaise Cendrars, *Du Monde entier*; A. Salmon, *Prikaz*; Cocteau, *Poésies*.

Drama. In the theatre we witness at first an attempt to go back to pre-war subjects: Claudel is continuing the series of *Annonce faite à Marie*, and *L'Otage*, by *Le pain dur*; Bataille gives *Sœur d'Amour*; Zamacois, *César*, *Ecrivain Public*; Saint-George Bouhélier, *Vie d'une Femme*. In 1920, pre-war standards still obtain with Currel, *L'Âme en Folie*; Bernstein, *L'Animateur*; Saint George Bouhélier, *Esclaves*; DuBois, *L'Hérodiennne*. But attempts at renewal are made successfully by M. Magre, *La Mort Enchaînée*; Pierre Frondaie, *L'Appassionata*; Lenormand, *Les Ratés*; perhaps Villard, *Paquebot Tenacity*; Cocteau scores with a disconcerting farce, *Bœuf sur le toit*. In 1921-23, the hold of the younger generation asserts itself. Besides Brieux (*L'Avocat*, *L'Enfant*), Currel (*Comédie du génie*), Bataille (*Chœur Humaine*), Bernstein (*Judith*), and the three revivers of *Don Juan*, Rostand (posthumous), Bataille, and H. de Régnier, there are those who belong to what may be called an intermediate generation, like P. Fort (*Louis XI*, *Homme Curieux*), Géraud (aimer), Porché (*Dauphine* and *Chevalier de Colomb*), Ghéon (*Pauvre sous l'Escalier*). The younger group claims attention aggressively: Lenormand (*Mangeurs de Rêves*); Simoun (*Dent rouge*); Natanson (*Enfant Truqué*, *Amants Saugrenus*); Pierre Frondaie (*L'Insoumise*, *Le Reflet*); J. J. Bernard (*Feu qui Prend Mal*); Sarmant (*Marriage de Hamlet*, *Pêcheurs d'Ombres*); Crome-lynk (*Cocu Magnifique*); Cocteau (*Mariés sur la Tour Eiffel*); Régis et Veynes (*Bastos le Hardy*). The most famous theatres open to the young authors in 1924 were: L'Œuvre, Le Vieux Colombier, L'Atelier, La Chimère, La Flamme, with such men as directors as Lugne Poé, Copeau, Dullin, Pitoeff, Baty.

The Novel. Reaching the chapter of the novel since the War, we face such a deluge of works of interest that nothing can be done within the space allotted us except to group the various tendencies, give the names of the most important writers in each group and refer for all details to the *New International Year Books*, 1914-24 (and perhaps to the article "*Le Roman Français depuis la Guerre*," by Albert

Schinz, in *Modern Language Journal*, May, 1923).

Authors representing the great classical literary style, and aiming to create works of lasting beauty: Ch. Géraud, Estauré, A. de Chateaubriant (Grand Prix du Roman in 1923, for *La Brière*). Catholics: Bourget, H. Bordeaux, Ardel, Bauman, Mauriac, Renaitour. Novelists dealing with the world beyond: Marcelle Tinayre (*Priscille Séverac*), H. Bordeaux (*Fantôme de la Rue Michel-Ange*), Pérochon (*Les Ombres*). Provincial and regional novelists: Bazin, Pérochon (*Nène*, Prix Goncourt, 1920), J. de Pesquidoux, Borden, H. Pourrat, R. Escholier (*Cantegril*), J. des Gachons, and the most famous of them all, L. Hémon, author of the Canadian novel, *Maria Chapdelaine*. Psychologists: André Gide, J. Romains, Marcel Proust (Prix Goncourt, 1919), who had a tremendous following which, however, was already subsiding when he died in 1922; Char-donne (*L'Épithalame*); Lavedan, Martin Du Gard (*Les Thibaut*); Benda, Rivière; Lucien Fabre (*Radevel*, Prix Goncourt, 1923). Novelists of deep gloom and sentimentality: Arnoux, Jaloux, Chéreau, Josepivici, t'Serstevens; and three women, André Cortis (Grand Prix du Roman, 1921, for *Pour Moi Seule*), Machard, Vioux. Pictures of moral disequilibrium in consequence chiefly of the War: Marcel Pré-vost (*Don Juanes*), Rosny, Marguerite, Mme. Colette. Novelists depicting the life of characters outside regular society: Carco (Grand Prix du Roman, in 1922, for *L'Homme traqué*), Mac Orlan, Cl. Anet, Berger, Kessel. The "Indifférents" to use the name chosen by one of them, i.e. who take the attitude of interested and amused, sometimes cynical, observers of our present nerve-wrecked world: H. de Régnier, Fr. de Miomandre, Giraudoux, Paul Morand (most before the public eye in 1924 for his two collections of stories *Ouvert la nuit* and *Fermé la nuit*). Young Cocteau belongs either here, or to a group of extreme modernists, some of whom had adopted the flag of Dadaism, like Aragon, Ph. Soupault, Delteil. Humorists would be: Duvernois, H. Béraud (Prix Goncourt for *Le Martyre de l'Obèse*, 1922), Bil-lotey. The great king of the *roman d'aventure* is Pierre Benoit, author of *L'Atlantide*; Rouquette, Exotism: Loti, Farrère, Rhais, and later Barrès (*Jardin sur l'Oronte*); Bordeaux (*Yamillé sous les Cèdres*). A very special place belongs to the Brothers Tharaud with their remarkable knowledge of the Near Eastern, largely Semitic, countries (*A l'Ombre de la Croix* is their masterpiece).

Historical Novels: Louis Bertrand, Tan-crède, Martel; H. Béraul (*Vitriole de Lune* crowned by the Goncourt in 1922). Pre-historical novels: Rosny, Forbin, Jean d'Esme.

Other Literary Genres. The most important during the period under consideration was that of personal recollections arranged with a special purpose, and at times with poetical evocations of the past, like A. France's *Petit Pierre*, Loti's *Prime Jeunesse*, Jammes, A. Gide, Willy; or many diaries of young authors who wrote about their years of formation so as to present a picture of their whole generation, or classes at least of their generation. The following claimed attention most: Oudart (*Ma Jeunesse*); L. Werth (*Dix-neuf Ans*); Cazin (*Décadi*); A. Obey, Chadourne (*Inquiète Adolescence*); Benj. Crémieux (*Pre-*

mier de la Classe); Gilbert des Voisins (*L'Enfant prit Peur*); and the sad *Diable au corps*,—written by Radiguet when he was 17 (it is said). He died in 1924. Another genre is the literary biography, brilliantly represented by A. Maurois's *Ariel, Vie de Shelley*, and by H. Bordeaux, *Amours du passé*. Accounts of travel have been raised to the level of art in Chadourne's *Pot au Vour*. Again we must mention the Brothers Tharaud with their remarkable descriptions of the Near-Eastern nations of Europe. Then Pierre Hamp continues his series of beautiful books on French trades and industries. The (so far two) series of the famous barrister Me Henri-Robert, *Les Grands Procès de l'Histoire*, have been much read.

History of Literature and Literary Events.

As the year 1924 opened, the first volume of Bédier and Hazard, *Histoire de la Littérature Française illustrée* came from the press—in every way a remarkable achievement. Simultaneously an illustrated edition of Lanson's well known *History of French Literature* was published serially. Most worthy of mention are also the volumes XII and XIII of Hanotaux's *Histoire de la Nation Française*, in 15 volumes (they are called *Histoire des Lettres*). Vol. XII, *Des Origines à Ronsard*, is by Picavet, Jeanroy, and Bédier; Vol. XIII, *De Ronsard à nos Jours*, is by F. Strowski. In America, Nitze and Dargan, of the University of Chicago, published an English *History of French Literature*. For modern times there was Le Goffic, *La Littérature Française au XIX^e et au XX^e Siècle*. A very valuable serial publication concerning contemporary writers is *Vingt-Cinq Ans de Littérature Française, de 1895 à 1920*, under the direction of E. Monfort. Not quite satisfactory is Lalou's little book on *Histoire de la Littérature Française Contemporaine, de 1870 à nos jours*. Mostly an accumulation of names and titles is found in F. Parmentier, *Littérature Française de 1885 à nos jours*; in America, *French Literature of the Last Half Century*, by Cunliffe and de Bacourt. Pierre Vaillant and H. Rambaud's *Enquête sur les Maîtres de la Jeune Littérature* (Bourget, Barrès, Maurras, 1923), has been mentioned already as having failed to inquire from all quarters, which impeaches their findings. A work on a great scale which led the author to the Academy even before the completion is Abbé H. Brémond's *Histoire du Sentiment Religieux dans la Littérature depuis le XVII^e Siècle*. Other important works that space allows us to mention are: Thieme, of the University of Michigan, *Essai sur l'Histoire du Vers Français*; P. Champion, *Hist. de la Poésie au XV^e et au XV^e Siècle*; Nohac, *Ronsard et l'Humanisme*; Ducros, *Rousseau* (3 vols.); Pierre Kohler, *Madame de Staël*; Vincent, *Georges Sand* (4 vols.); Arbelet, *Stendhal* (2 vols., in connection with the new edition of Stendhal's works); J. Larat, *Tradition et Égotisme dans l'Œuvre de Nodier*; H. Girard, *Emile Deschamps* (2 vols.); Estève, *Leconte de L'Isle*; Ibrovac, *José-Maria de Hérédia*; Antoine, *Souvenirs du Théâtre Libre*. New valuable editions which render the study of great French authors more and more profitable are: Villon, Ronsard, Montaigne, Pascal, Stendhal, Lamartine (Lanson, *Méditations*), Hugo (*Béré, Légende des Siècles*, Vianey, *Contemplations*). As to language: another volume by Brunot

came out, *Le Français en France et hors de France au XVII^e Siècle* (Brunot has also made an attempt at reviving interest in the teaching of grammar in a large volume *La Pensée et la Langue*), and there was Bonaffé, *Anglicismes et Américanismes dans la Langue Française*.

A time has never been in France without literary quarrels of some sort. During the War there was the Barbusse episode, many maintaining that the book had been dishonestly used for pacifist propaganda; in 1919, Pierre Louys startled the world in ascribing to Corneille some of the best of Molière's plays; in 1920, the accusation was brought against P. Benoit that he had plagiarized Sir Rider Haggard's *She*, for his *Atlantide*; the same year the episode of Dadaism came to a climax in the artistic and literary world: in 1922, it was the shock of Margueritte's *Garçonne*; in 1922-23, the "querelle des manuels littéraires" (well summarized in *Chronique des Lettres Françaises*, January, 1923).

Among the innumerable literary prizes, some are of real importance. Let us recall a very few: Grand Prix de Littérature went to Mme. Gérard d'Houville (1918), the Brothers Tharaud (1919), E. Jaloux (1920), Mme. de Noailles (1921), P. Lasserre (1922), F. Porché (1923). The Grand Prix du Roman went to Camille Mayran (1918), Ch. Géniaux (1919), André Corthis (1920), Villetard (1921), F. Carco (1922), A. de Chateaubriant (1923). The Prix Goncourt went to: Benjamin (1915), A. Bertrand and Barbusse (1914 and 1916), Malherbe (1917), Duhamel (1918), Proust (1919), Pérochon (1920), R. Maran (1921), Béraud (1922), L. Fabre (1923). The Prix de la Vie Heureuse, or Prix Femina went to: Dorgelès (1918), (1919), E. Goyon, a poet (1920), Escholier (1921), Lacretelle (1922), Jeanne Galzy (1923).

Many jubilees were celebrated; with peculiar splendor those of Molière, Pasteur (not only a man of science but also a member of the French Academy), Renan and Pascal. Many deaths occurred in the decade: in 1914, Lemaitre, Masson-Forestier, Mistral, L. Séché, Ch. Péguy; 1915, Hervieu, R. de Gourmont, Stuart Merrill, J. H. Fabre (the entomologist), Lafon, Paul Acker, Rob. d'Humières; 1916, Faguet, de Segur, de Vogüé, Verhaeren, Clermont; 1917, A. Bertrand, 1918, G. Ohnet, Rostand, Péladan, Guill. Apollinaire; 1919, Tailhade, Ch. Morice; 1920, P. Adam, Lintilhac; 1921, Montesquiou; 1922, Bataille, Boutroux, Capus, Lavis; 1923, Aicard, Loti, Barrès.

FRENCH SOMALI COAST. See SOMALILAND.

FRENCH WEST AFRICA. A single administrative unit of the French colonial empire since Jan. 1, 1921, comprising the following colonies: Senegal, area 74,112 square miles, population in 1921, 1,225,523 (4321 non-African); Guinea, 95,218 square miles, population, 1,875,996 (1357 non-African); Ivory Coast, 121,976 square miles, population, 1,545,680 (835 non-African); Dahomey, 42,460 square miles, population, 261,746 (214 non-African); French Sudan, 617,600 square miles, population, 2,474,589 (983 non-African); Upper Volta, 154,400 square miles, population, 2,974,142 (191 non-African); Mauritania, 347,400 square miles, population, 261,746 (214 non-African); Niger Territory, 347,400 square miles, popula-

tion, 1,084,043 (216 non-African) Total, 1,800,566 square miles, with a population of 12,283,962, of whom 6829 were French and 1826 other non-Africans. Dakar, the seat of the administration and the leading port, had 32,440 inhabitants in 1921, of whom 2331 were French. Other towns were: Saint Louis, 18,117 (620 French); Rufisque, 11,307 (168 French); Bamako, 14,496; Kayes, 11,322; Conakry, 8850. Forest and agricultural products were of greatest economic importance. In Senegal, the Sudan, and Guinea the groundnut was of leading importance. In 1920, from Senegal alone 286,777 tons were exported. Cotton culture, worked by natives, figured largely in Senegal, the Sudan, Dahomey, and the Ivory Coast. The total production in 1918 was 854,000 kilos. Other important activities, as reflected in the foreign trade, were palm kernels, palm oil, logs, gum arabic, hides and skins, and caoutchouc. Agricultural experiments indicated that the following were possible of development: cacao and coffee in Dahomey and the Ivory Coast, tobacco, vegetables, etc. Gold and salt were worked in paying quantities. Exports for the whole government in 1920 and 1921 were 588,694,000 francs and 259,764,000 francs, as compared with 118,567,000 francs in 1912. Imports for the years 1912, 1920, 1921, were 134,782,000 francs, 653,910,700 francs and 372,497,000 francs. In 1920, 8629 vessels of 5,109,573 tons entered the ports of French West Africa, while 8462 vessels of 5,080,965 tons cleared. This compares with the 2431 vessels of 4,172,000 tons which entered in 1911. Communications were facilitated by the navigability of the Senegal and the Niger Rivers. In 1920, 2658 kilometers of railway were in operation. The principal systems included: Dakar-Saint Louis (263 kilometers), Thiès-Kayes (444 kilometers), Kayes-Niger (555 kilometers), Guinea railways (662 kilometers), Ivory Coast railways (316 kilometers), Dahomey railways (375 kilometers). Besides, roads fit for motor traffic totaled 5400 kilometers. Kilometers of telegraph lines in 1922 were 23,278. The general budget for the whole administration was, for 1923, 72,142,000 francs, as compared with 56,250,000 francs in 1911. In 1922, the local budgets for the separate colonies totaled 172,500,000 francs. At Dakar, the governor-general, assisted by a council of native chiefs, administered the affairs of the whole government. Lieutenant-governors were in charge of the individual colonies.

FREUD, SIGMUND (1856-). An Austrian physician (see VOL. IX) and originator of the psycho-analytic method for the treatment of neuroses. The international reputation of Freud increased after the War, and his works obtained a vogue even in such countries as France, where psycho-analysis had been previously regarded as too extravagant in its claims. The pathological cases in the armies during the War put Freud's theories to something like an empirical test, and it was recognized by Freud's own disciples that sex was not the controlling factor. Freud himself in his writings after 1914 tended to make less use of the principle of sexual symbolism and relied more on the direct intuitions afforded by the psychological situations. The conception of the libido continued to play an important rôle but without complete identification with concrete sex experience. See CONSCIOUSNESS AND

THE UNCONSCIOUS; ÆSTHETICS; PSYCHOLOGY, ABNORMAL, AND PSYCHOANALYSIS; PERCEPTION.

Freud's works after 1914 include *Totem and Taboo* (1915); *Wit and Its Relation to the Unconscious* (1916); *Leonardo da Vinci* (1916); *Delusion and Dream* (1917); *The History of the Psycho-analytic Movement* (1917); *Reflections upon War and Death* (1918); *Massenpsychologie und Ichanalyse* (1921; English translation, *Group Psychology and the Analysis of the Ego*, 1922), and *General Introduction to Psycho-analysis* (1921).

FREY, EMIL (1838-1922). A Swiss statesman and former president of the Swiss Confederation (see VOL. IX), who died near Basel, Switzerland, in 1922. After the War he was one of the technical experts attached to the Swiss delegation at the Genoa Conference.

FRIDAY, DAVID (1876-). An American economist and educator, born at Coloma, Mich. He graduated from the University of Michigan in 1908, and was a member of the faculty of that university from 1908 to 1916, when he was appointed professor of economics at New York University. In 1918 he was head of the department. From 1919 he was professor of political economy at the University of Michigan. He served as statistician and expert to many important commissions, and was also adviser to several governmental departments and boards. He was a member of several learned societies and was the author of *Problems in Accounting*, 1915; *Readings in Economics*, 1915; *Profits, Wages and Prices*, 1920.

FRIENDS, RELIGIOUS SOCIETY OF. The Friends, commonly known as Quakers, are composed of four branches: the Society of Friends (Orthodox), Society of Friends (Hicksite), Orthodox Conservative Friends (Wilburite) and Friends (Primitive). The Orthodox branch, which is by far the largest, decreased from 98,356 members in 1914 to 85,612 according to figures supplied in 1923, and the number of meeting houses from 775 to 714, and the number of ministers from 1315 to 1252. During the war the Friends, whose tradition is for non-resistance, were very active in relief work in France, Germany, Holland, Poland and Russia. In 1919 the denomination had 650 relief workers in France, about half of them being American, and half British. They conducted eight general hospitals, one maternity hospital, two convalescent hospitals, a tuberculosis hospital and tuberculosis village, a home for old women and several children's homes. The maternity hospital after the War was presented to the French government. The society also took entire charge of the reconstruction work between Verdun and the Argonne Forest. In 1919 and 1920 there were 15 workers in Serbia and 90 doctors and nurses fighting the typhus in Poland. After January, 1920, the Society took complete charge of the relief work in Germany. Altogether under their auspices over 5,000,000 received one warm meal a day for a greater or less length of time. Relief work was also maintained on an extensive scale in Poland and in Russia.

FRIES, ARCHIBALD (1864-). An American railway official, born in Cincinnati, Ohio. He was educated in the public schools of that city and began his railroad employ in a clerical capacity with the Ohio and Mississippi Railroad. For several years he was employed in

various important capacities by the Baltimore and Ohio Railroad and served as general traffic manager of the Eastern Lines, 1916-18. His jurisdiction was extended over the entire system. During the War he served as traffic manager to the Railroad Administration.

FRIESEKE, FREDERICK CARL (1874-). An American painter (see VOL IX). Among other recognitions received by him during the period, were a grand prize at the Panama-Pacific Exposition, in 1915, also the Palmer Gold Medal, Art Institute of Chicago, in 1920; and a gold medal, Philadelphia Art Club, in 1922. In his later works, among them "The Blue Gown," "Golden Locket," "Lady in Rose," he was still decidedly the impressionist chiefly interested in representing female figures and the nude.

FRISCHEISEN-KOHLER, MAX (1878-). A professor of philosophy and pedagogy. His works include *Probleme des Ewigen Friedens* (1915), *Grenzen der Experimentalen Methode* (1918), and *Simmel* (1919); he edited Ueberweg's *History of Philosophy* and translated Shaftesbury and Hobbes.

FRITCH, LOUIS CHARLTON (1869-). An American engineer, born in Springfield, Ill. He took an engineering course at the University of Cincinnati and was division engineer of the Baltimore and Ohio Railroad in that city until 1899, when he became superintendent. He acted successively as assistant to the general manager, assistant to the president, and consulting engineer for the Illinois Central Railroad until 1909, when he became chief engineer of the Chicago Great Western Railroad. From 1914 to 1917 he was general manager for the Canadian Northern Railway and was general manager for the S. A. L. Railway, Norfolk, Va., and vice-president of the C. R. I. & P. R. R. from 1918. He was president also of the R. I. and Oklahoma Railway Company and was president of several important corporations.

FROST, ROBERT (1875-). An American poet born in San Francisco and educated at Dartmouth and Harvard. After teaching English in the Pinkerton Academy (Derry, N. H.) and teaching psychology (1911-12) at the New Hampshire Normal School, he went to England and published there his first two volumes of prose. On his return to America he did some active farming at Derry, Conn., and culled therefrom a knowledge of rural life in New England, as was illustrated in his *North of Boston* (1914), which immediately placed him in the front rank of contemporary American poets. In most cases his pictures of Yankee shyness prove an intimate understanding and love of his neighbors which could come only through close contact. And in his hands the folk speech of these people possesses a beautiful and melancholy dignity. In 1916-20, he was professor of English at Amherst College; then was poet in residence at the University of Michigan; and in 1923 returned to the faculty of Amherst. He has also written *A Boy's Will* (1913), *Mountain Interval* (1916), *New Hampshire* (1923), and many poems for the magazines.

FROTHINGHAM, PAUL REVERE (1864-1926). An American clergyman, born at Jamaica Plain, Mass., and educated at Harvard University. After preaching for some years at New Bedford, Mass., he became minister of the Arlington Street (Unitarian)

Church in Boston in 1900. He was preacher to Harvard University at various periods between 1899 and 1921. He is the author of *William Ellery Channing, His Messages from the Spirit* (1907); *A Confusion of Tongues* (1917), *We Believe* (1917); and *Our Debt to Great Britain* (1919).

FRUIT See HORTICULTURE.

FRYATT, CHARLES (1872-1916). A British sea-captain, born near Harwich, Essex. In 1904 he became chief officer in the service of vessels of the Great Eastern Railway Company. During the first two years of the War he captained the *Drussels* between Harwich and Rotterdam. In July of 1916 word was received in England that Captain Fryatt's ship had been captured by the Germans and that he had been arrested and was to be tried by court martial on a charge of having attempted to ram a German submarine. Almost immediately after the execution had been carried out at Bruges on July 28, 1916, an order was received from Berlin to postpone sentence. Great indignation was felt by the British, who considered this another act of treacherous murder on the part of the Germans.

FUAD I (AHMED FUAD PASHA) (1868-). King of Egypt, son of the late Khedive Ismail Pasha. He became Sultan on Oct. 9, 1917, and after the termination of the British Protectorate over Egypt in February, 1922, he was proclaimed king (March 16). King Fuad is the eighth ruler of the dynasty of Muhammad Ali, who made himself absolute ruler of Egypt by force of arms in 1805.

FUCHS, EMIL (1866-). An Austrian sculptor, painter and medallist. He was born in Vienna and studied under Tilgner and later in the academies of Vienna and Berlin. In 1890 he won a traveling scholarship and spent five years in Rome. In 1896 he won the gold medal at Munich with the group "Mother Love." He then went to London, where he executed a series of important commissions for the royal family, portraits, sculptures, and medals, and became very popular. In the United States he designed medals for the Hudson-Fulton Celebration and Hispanic and Numismatic Societies and the J. Pierpont Morgan Memorial Medal, and painted a number of portraits of distinguished men and of society women. His work is pleasing rather than powerful. An important exhibition of his works was held in New York in 1921.

FUERTEES, LOUIS AGASSIZ (1874-). An American illustrator and mural painter (see VOL. IX). In his specialized field, bird and animal life, he illustrated several series for the *National Geographic Magazine*, 1914-19, Burgess's *Bird Book for Children* (1917), and Burgess's *Animal Book for Children* (1920); and executed paintings for the New York Zoological Society.

FULLERTON, GEORGE STUART (1859-1925). An American professor of philosophy (see VOL. IX). His works after 1914 include *Germany of To-day*, a defense (1915), and a *Handbook of Ethical Theory* (1922).

FUNCTIONALISM. See BEHAVIORISM.

FUNDAMENTALISM. See RELIGIOUS CONTROVERSIES.

FURMAN, FRANKLIN DE RONDE (1870-). An American engineer and educator, born in Ridgely, Md. He graduated from the Stevens Institute of Technology in 1893, and from the same year was professor of mechanism and ma-

chine design at that institution. He was a member of several engineering societies and wrote *History of the Stevens Family of Engineers*; *History of Stevens Institute of Technology*; *Questions and Problems in Machine Design*; *Questions in Engineering Drawing*. He also contributed articles to magazines.

FURNESS, CAROLINE ELLEN (1869-). An American astronomer and educator, born in Cleveland, Ohio. She graduated from Vassar College in 1891 and took postgraduate courses at Columbia. She became a member of the faculty of Vassar College and from 1915 was Maria Mitchell Professor. She performed research work at the Yerkes Observatory and in Europe, and was a member of several scientific and other societies. She was the author of several star catalogues and *Introduction to the Study of Variable Stars* (1915). She also contributed articles to American and European journals.

FURNESS, HARRY (1854-1925). A British caricaturist, artist, author and lecturer (see VOL. IX). Among his later works were *Our Lady Cinema* (1914); *More about How to Draw in Pen and Ink* (1915); *Deceit* (1917); *Stiguns* (1920). He has been characterized as vigorous, versatile, brilliant in draftsmanship, facile in execution. During this period he also gave numerous humorous lectures throughout England, and wrote many scenarios.

FURSE, DAME KATHARINE (1875-). An English woman, born at Bristol, the daughter of John Addington Symonds. In 1914 she founded and directed the Voluntary Aid Detachment, a department under the Red Cross in France. She was director of the Women's Royal Naval Service, 1917-19. In recognition of her admirable work, she received the Order of the Royal Red Cross (1916) and the Order of the British Empire (1917).

FURTH, HENRIETTE (1861-). Identified with child welfare work at Frankfort. She was a student of labor problems, especially those connected with factory work of women

and with sex reforms. She is the author of *Die Frauen im Kriege* (1917) and *Zur Sozialisierung der Oeffentlichen Wohlfahrtspflege* (1920).

FURTWÄNGLER, WILHELM (1886-). A noted German orchestral conductor, born in Berlin. Having completed his studies in Munich under Beer-Walbrunn, Rheinberger and Schillings, he began his career in Zurich. From 1911 to 1914 he was principal conductor at the Opera in Lubeck, directing also the concerts of the Verein der Musikfreunde. In 1915 he succeeded Bodanzky in Mannheim, where he remained four years and established a reputation which brought him invitations for guest-appearances with the foremost German and Austrian orchestras. He was regular conductor of the Vienna Tonkünstlerorchester (1919-20) and of the symphony concerts of the Berlin Staatsoper (1920-22), succeeding Richard Strauss. In 1922 he was chosen Nikisch's successor as conductor of the famous Gewandhaus concerts in Leipzig and of the Philharmonische Gesellschaft in Berlin. In 1923 he aroused great enthusiasm in London.

FUTURISM. See PAINTING, SCULPTURE, AND MUSIC.

FYFE, H. HAMILTON (1869-). An English author and journalist, born in London and educated at Fettes College in Edinburgh. His career in journalism started as a reporter in 1889, and after approximately 13 years of holding various positions as reviewer, dramatic critic, etc., he edited the *Morning Advertiser* (1902-03), subsequently becoming dramatic critic for *The World* (1905-10), correspondent of the *Daily Mail* (1907-18), lecturer in Spain and Portugal (1917), attaché in the British War Mission to the United States (1917), etc. He has published many books and plays, which include *The Real Mexico* (1914); *The Meaning of the World Revolution* (1919); *The Kingdom, the Power, and the Glory: A Morality* (1920); *The Widow's Cruse* (1920); *The Making of an Optimist* (1921), and *The Fruit of the Tree* (1921).

G

GABRILOVITCH, OSSIP (1878-). A Russian pianist (see Vol. IX). Besides being recognized as one of the greatest pianists of his day, he won fame as an orchestral conductor. From 1910 to 1914 he was conductor of the Konzertverein in Munich, but he did not abandon his career as a pianist. During 1912-13 he won veritable triumphs in several European capitals with his series of six historical concerts illustrating the development of the piano-concerto from Bach to Rachmaninov. After the outbreak of the War he came to the United States, giving the same cycle and arousing the same enthusiasm. In 1918 he became conductor of the Detroit Symphony Orchestra, which under him won a place among the premier orchestras of the country.

GAILOR, THOMAS FRANK (1856-). An American Protestant Episcopal bishop (see Vol. IX). He became chairman of the House of Bishops of the Protestant Episcopal Church in 1916, and president of the Presiding Bishop and Council in 1919. He has received honorary degrees from Oxford (1920) and Oglethorpe University (1921).

GALE, ZONA (1874-). An American writer (see Vol. IX). She wrote *Neighborhood Stories* (1914); *Heart's Kindred* (1915); *A Daughter of To-Morrow* (1917); *Birth* (1918); *Peace in Friendship Village* (1919); *The Secret Way* (1921); *The Neighbors*, a one-act play; and *Miss Lulu Bett*, the dramatic version of which received the Pulitzer Prize of \$1000 as the best play of the year produced in New York (1920). *Master Pitt*, a dramatized version of *Birth*, was produced in New York in 1924.

GALICIA, EAST. In the determination of the southeastern boundary of Poland, and in particular the disposition of the former Austrian province of Galicia, the Peace Conference was confronted by one of its most vexing problems. In fact it was not until March, 1923, that the matter could be considered as settled, and then only after a fashion. The question of West Galicia roused little controversy: the district was solidly Polish, and the Supreme Council, in assigning it to Poland by the "Certain Frontiers" Treaty of Aug. 10, 1920, was clearly recognizing Polish historical and ethnical rights. But the eastern two-thirds of the province raised other questions. In East Galicia the majority of the inhabitants were Ruthenians, i. e. Ukrainians; the 1910 census showed a population made up of 59 per cent of Ruthenians, 27 per cent Poles, and 13 per cent Jews. Besides the question of race, religious and cultural antipathies existed. The Poles are Roman Catholic; the Ruthenians, Greek Orthodox Uniate. From 1867 on, when Galicia became a single province, the Poles were the leading force in Galician affairs, for they lived in the towns and headed the professions and the trades, while 91 per cent of the Ruthenians were dependent on agriculture. In fact, by 1910, 62 per cent of the Ruthenians were illiterate, against only 23 per cent of the Poles. In spite

of these differences the two groups lived fairly amicably side by side until 1880, when a Ukrainian movement, aided to some extent by Austria, appeared among the Ruthenians and roused fanatical nationalistic animosities. Part of this movement sought the creation of an independent Ukraina, another part union with the people of the Russian Ukraine in Russia, Ruthenian interest centred in the question of race, while the Poles, in addition to their cultural and commercial dominance, sought East Galicia for military and economic reasons. They stressed the necessity for a common frontier with Rumania and a united front against Soviet Russia; a junction with Rumania would mean Polish control of the headwaters of the Dniester and thus facilitate Polish trade in the Black Sea area; Poles pointed out that they needed the great oil fields of Galicia for the economic well-being of their new state. With the collapse of Austria, the so-called Republic of the West Ukraine was set up and an attempt was made to incorporate the whole of East Galicia in a Ukrainian state. The Poles naturally objected and bitter fighting between irregular troops went on until May, 1919, with the important city of Lemberg as the chief point of contention. In May large Polish contingents appeared in the country; by June the Ruthenian resistance had broken down, and Poland was in possession of the whole as far east as the Zbrucz. The Peace Conference had up to this time tried valiantly to cope with the problem. Undoubtedly, as the British contended, the Ruthenians were entitled to some sort of self-determination, and it was manifestly unfair to cede the territory to Poland outright. No group, however, seemed willingly to consider a transfer of East Galicia east of the Lemberg-Drohobycz line to Russia. But the Poles presented the delegations with a *fait accompli*, and it was no doubt with relief that on June 19 the Poles were authorized to continue their military occupation of the whole country. Plain justice, nevertheless, demanded a consideration of Ruthenian claims, and to the end of 1919 the Supreme Council concerned itself with plans for the guarantee of Ruthenian autonomy. But the French succeeded in blocking all these attempts, so that up to 1923 the province remained legally, according to the Treaty of St. Germain, in the hands of the Allies, while the Poles maintained their *de facto* possession. Undoubtedly the just disposition of the province had presented almost insuperable obstacles; the League of Nations could not handle the task in 1919, for it was not yet functioning, while none of the European powers was in a position to take up the onerous duty of protection and administration in a region where hatreds were so implacable. Something might have been done, commentators agreed, nonetheless, to safeguard the interests of the Ruthenians. As things were, 4,500,000 Ruthenians were under the domination of a Polish minority, with no provision for the protection of their liberties or the ascertainment of their wishes. On Mar. 14, 1923, the capstone was

placed on the situation when the Council of Ambassadors, in definitively laying down the boundaries of Poland, assigned East Galicia to Poland. It was evident that the seeds of a new irredentism had been planted to trouble ultimately the peace of Europe. See *POLAND, History*; *WAR IN EUROPE, Eastern Front*.

GALLAGHER, MICHAEL JAMES (1866-). A Roman Catholic bishop, born at Auburn, Mich., and educated at Mungret College, Limerick, Ireland, and at the University of Innsbruck, Austria. He was ordained priest in 1893, and after filling several pastorates and holding various offices he became bishop of Grand Rapids in 1916. In 1918 he was transferred to Detroit.

GALLI-CURCI, AMELITA (1889-). A brilliant Italian coloratura soprano, born at Milan. Among the world's great singers, present or past, her case is without parallel as the only example of an artist achieving distinction without technical training under a teacher. While studying at the Conservatory in Milan she devoted herself exclusively to the piano, under Appiani, with the ambition of becoming a pianist, and with such success that in 1903 she won the first prize. Later, on discovering that she was gifted with a fine natural voice, she began a unique system of self-instruction. She had records made of her voice, and these she studied carefully, her exceptionally keen ear enabling her to discover and remedy imperfections. However, she acknowledged her indebtedness to Mascagni and William Thorner for advice. In 1909 she made her debut as Gilda in *Rigoletto* at the Teatro Costanzi, in Rome, winning instantaneous success, which secured her appearances at several important Italian opera houses during the same year. The next year she made her first tour of South America, after which she sang again in Italy. In 1912 she was again in South America; in 1914 she made her first tour of Spain, and in 1915 she sang in Havana. Then came her sensational success with the Chicago Opera Association (Nov. 18, 1916), of which she was a regular member until 1924. But all these triumphs were eclipsed by the ovations she received at her first appearance in New York (Jan. 28, 1918), when the Chicago company visited the metropolis for a four weeks' season. These visits were repeated annually till 1922. Beginning with 1923 Galli-Curci appeared every season as guest artist at the Metropolitan Opera House. Strange to say, London did not hear her till the fall of 1924. She was married in 1910 to the painter Luigi Curci, whom she divorced in 1920. In 1921 she married Homer Samuels, her accompanist.

GALLIENI, JOSEPH SIMON (1849-1916). A French general and statesman. See *WAR IN EUROPE, Western Front*.

GALLIPOLI. See *WAR IN EUROPE, Turkish Front*.

GALLOWAY, BEVERLY THOMAS (1863-). An American botanist (see VOL. IX). In 1913-14 he was Assistant Secretary of Agriculture, and in 1914-16, dean of the State College of Agriculture of Cornell University. From the latter date he was pathologist of the office of seed and plant introduction for the United States Department of Agriculture.

GALLOWAY, CHARLES WILLIAM (1868-). An American railway official, born in Baltimore, Md. He began his railway career

as a messenger in the telegraph department of the Baltimore and Ohio Railroad in 1883. He served that road in various capacities and became superintendent of transportation in Baltimore in 1906. He served as general manager of the Baltimore and Ohio from 1912 to 1916 and as vice-president and general manager of the Baltimore and Ohio Southwestern from 1916 to 1918. He was Federal manager for the western lines of several railways during the War, and from 1920 he was vice-president in charge of operation and maintenance for the Baltimore and Ohio system.

GALLSTONE DISEASE. During the decade 1914-24 new methods of diagnosis and treatment of gallstone disease were introduced by Dr. Lyon of Philadelphia and his disciples which were incorporated in his large monograph on non-surgical drainage. By means of the duodenal sound it is possible to obtain bile under all kinds of circumstances and subject it to analysis. The discovery that the bile in gallstone disease may be entirely normal is contrary to the old belief that stones cannot form in the presence of healthy bile. The chologogue action of various substances can be studied by introducing them into the duodenum through the stomach and watching their action on the flow of bile. It becomes evident that the empirically recognized chologogue substances are scientifically justified, for magnesium sulphate, olive oil, sodium phosphate and a number of others all appear to possess this property of expelling bile from the gall bladder into the duodenum. It is also possible by means of any one of these substances introduced into the duodenum to cause the escape of stones, or what is better, to prevent their formation by occasional resort to the sound.

The claim that the use of the latter may sometimes precipitate a severe attack of gallstone colic in a patient in whom the stones might never have caused trouble if left alone may be viewed from various angles. Thus we may entirely disbelieve in this possibility in the absence of complete proofs, or we may look on it as a rare event of little practical importance to the public at large; finally, we may regard the expulsion of a quiescent stone as a good thing. Dr. Hedinger of Basel has furnished considerable evidence in support of the belief that gallstones are really amenable to solution, or at least to a partial solution, in their own bile. To what extent therapeutics will profit by such a discovery is at present problematical.

GALLWITZ, MAX C. W. VON (1873-). A German artillery general, born at Breslau, and educated at the Gymnasium and military academy. He entered the artillery service in 1870 and was progressively promoted until he became lieutenant-colonel in 1896. He was made department chief in the War Ministry the following year. His promotions continued, and he became major-general in 1902. In 1903 he had the direction of the army in the war ministry; in 1906 he was made commander of the 15th division; and in 1911, general of artillery and inspector of field artillery. During the entire period of the War he was artillery corps commander. In 1918 he was made commander-in-chief of several armies. He was raised to the nobility in 1913.

GALSWORTHY, JOHN (1867-). An English author (see VOL. IX). Among his lat-

er works are *The Little Man and Other Satires* (1915); *The Freelanders* (1915); *A Sheaf* (vol. i, 1916); *Beyond* (1917); *Five Tales* (1918); *A Sheaf* (vol. ii, 1919); *Saint's Progress* (1919); *Addresses in America* (1919); *Tatterdemalion* (1920); *The Forsyte Saga* (1922); and the plays, *The Mob* (1914); *A Bit o' Love* (1915); *The Skin Game* (1920); *Six Short Plays* (1921); *A Family Man* (1921); *Loyalties* (1922), and *Windows* (1922). In all his later works appear the author's usual intellectual fineness and careful and thoughtful weaving.

GAMBIA. A British colony and protectorate at the mouth of the River Gambia in West Africa. Area of colony proper, 4 square miles (population, 9000); area of the protectorate 4130 square miles (population in 1921, 200,000). The chief export from Gambia was groundnuts, with a total of 64,178 tons in 1923, compared with 66,000 tons in 1914. This made up 96 per cent of the total shipments. Other exports were palm kernels and hides. Total exports for 1923, £884,309 as compared with £926,127 in 1914. The British Empire took 49 per cent of the exports in 1923, France 39 per cent, and Germany 7 per cent. Imports for 1923 were £709,013 as compared with £688,007 in 1914. The British Empire supplied 69 per cent, France 13 per cent, Germany 7 per cent, and the United States 5 per cent in 1923. Most of the sugar imported was from France, and the tobacco from the United States. Kolanuts and cotton goods were other imports. In 1913, 625,132 tons entered and cleared; in 1923, 1,052,982 tons. Revenues in 1913 were £124,990; 1920, £268,788; 1922, £204,244. Expenditures in 1913 were £95,210; 1920, £171,160. 1922, £430,312. The last figure included £200,000 incurred by the demonetization of the five-franc pieces which had so depreciated during and after the War that it was necessary to collect them for shipment to England to be melted down. The United States, during and after the War, supplanted Germany in the Gambian import trade. In 1919 American shipments rose to \$900,000. The natives persisted in devoting themselves exclusively to the groundnut industry to the neglect of food crops. During the War this caused a real food stringency because of the lack of shipping.

GANDHI, MOHANDAS KARAMCHAND 1869–). An Indian nationalist leader, born at Porbander, India. He went to London in 1888 to study law. After careful observation of Christianity and western civilization, he returned to India in 1893, but soon afterward went to South Africa to practice law. He was brutally mistreated by the white men in South Africa, but he bore his burden by developing a philosophy of passive resistance. On the outbreak of the War he raised a volunteer ambulance corps in London of the residents there and in 1917 was active in raising a corps of Indian recruits in Kheda. He went into retreat in 1916 at Ahmedabad and there came under the influence of the teachings of Tolstoi. On the passing of the Rowlatt Act, he encouraged the "noncooperative" movement and agitation against the British Government and so had much to do with the Punjab disturbance of 1919. Through the union of the Hindus and Mohammedans, Gandhi promised to effect an impregnable native opposition to the British and eventually the demolition of their government in India. When the All-India Congress

met on Dec. 24, 1921, at Ahmedabad, he was appointed sole executive, and thus virtual dictator of the noncooperative forces.

For his part in the Punjab and other disturbances, he was tried in March, 1922, and sentenced to prison for six years. While many looked on and feared a gigantic uprising in India in defense of the man whom the Indians looked on not only as a reformer but as a saint, Gandhi admonished them not to resort to arms, but to get out their spinning wheels and spin. He went to prison cheerfully, and no disturbance occurred. During his imprisonment, reports from India were that Gandhi's economic policies and philosophical teachings were being discredited. In the early part of February, 1924, Gandhi was released unconditionally by order of the British government. See INDIA.

GANS VON LUDASZY, JULIUS (1838–1923). A prominent Austrian journalist and popular author, born in Vienna. He studied law and medicine, but practiced neither. His becoming a contributor to Vienna newspapers led eventually to his becoming editor of the *Wiener Neue Freie Presse*, a position which he held from 1902 to 1915. His first work was a thesis, *Die Wirtschaftliche Energie: System der Oekonomistischen Methodologie* (1893). He later published *Also Sprach Confucius* (1900). Thereafter he devoted himself to drama and fiction. Among his plays, most of which were produced in Vienna, are *Bessere Leute* (1902), *Der Sonnenstaat* (1904), and *Die Trennende Brücke* (1913); among his stories, *Die Heilige Schlange* (1912), *Die Macht der Schatten* (1914), *Die Grosse Sunde* (1915), *Der Tanzende Stern* (1917), and *Der Turm der Liebe* (1920).

GANT, SAMUEL GOODWIN (1869–). An American surgeon and proctologist, born at Knoxville, Mo., and educated at the Missouri Medical College. He practiced for some years in Kansas City, Mo. In 1899 he removed to New York City to become professor of surgery (proctology) in the New York Postgraduate School of Medicine, succeeding Professor Kelsey. For some years he conducted private surgical hospitals and joined the staff of Broad Street Hospital. He has published numerous works covering diseases of the colon, rectum, and intestinal tract as a whole: *Diagnosis and Treatment of Diseases of the Rectum* (1896; rev. 1902); *Constipation and Intestinal Obstruction* (1909), reissued in 1916 in revised form as *Constipation, Obstipation, and Intestinal Stasis; Diarrhoeal, Inflammatory, Obstructive, and Parasitic Diseases of the Gastrointestinal Tract* (1915); and *Diseases of the Rectum, Anus and Colon* (3 vols., 1923).

GANZ, RUDOLF (1877–). A Swiss pianist (see VOL. IX). In 1921 he transferred his main activity from the field of piano playing to that of conducting, when he accepted the conductorship of the St. Louis Symphony Orchestra.

GARBAGE AND REFUSE DISPOSAL. The net changes in garbage and refuse disposal between 1914 and 1924 left the various processes in much the same relation to each other as at the beginning of the period, although perhaps with some shifting as to preferences shown by the different cities for one method or another and certainly with some marked changes in the processes themselves. In Europe the War resulted in almost complete cessation of this

municipal service in many cities or else in material changes of method. In the United States and Canada the garbage and refuse collection service was not affected in any such degree as it was in Europe, but notable shifts were made in methods of disposal. The latter were designed more particularly to effect the recovery of material from the garbage and refuse, especially food values usable for feeding to hogs. In the many army camps, besides hog feeding through contract service, there was a remarkable salvage of all sorts of camp waste, both that generally associated with municipal refuse and other waste materials peculiar to army camps.

Stimulated by the United States Food Administration, by rigid demands for municipal economy, and by the willingness of contractors to take municipal garbage for utilization, several American municipalities either materially increased the amount of garbage already being disposed of by feeding to hogs or else took up that method of disposal systematically for the first time. Of the latter, notable instances were Newark, N. J., Baltimore, Md., and Buffalo, N. Y. This was due both to the size of the cities and the nature of the contracts entered into, which was characterized at the time as "taking the gamble out of garbage." These contracts provided that the contractor would pay the city for the garbage as delivered to him at a price per ton of garbage based on the wholesale price of hogs on the Chicago market. In England, hog feeding was somewhat resorted to, but apparently not so far as in the United States.

United States Food Administration Statistics. The most extensive statistics on garbage and refuse collection and disposal ever made available in the United States were gathered by the United States Food Administration in 1917. They covered, as far as possible, places of 10,000 population and over. Of 779 of these places for which data were presented, 526 had a systematic collection, 171 had no collection service, and 82 places were not reported. Of 524 cities reporting whether the refuse was collected by the city, by contract, or privately, 84 reported collection by the city alone, 96 by contractors, 36 privately; that is, without contract and presumably with little supervision by the city; 308 had a mixed system of collection. Disposal methods were reported for 698 places with a population totaling nearly 44,000,000. Of these, 345, with a population over 11,000,000, reported disposal by feeding, doubtless mostly to hogs; 102 places with a population of 7,000,000 reported incineration, 37 places with a population of 18,500,000 reported disposal by reduction, or the recovery of grease and fertilizer base; and 214 places with 7,000,000 population gave the method of disposal as burning, burying, or dumping, the former probably meaning for the most part burning waste paper and other combustible material on dumps. It should be understood that these figures are for the total populations of the cities in each class and not the populations actually served by the several methods enumerated, which would probably be very much less. The gross total population of the cities reporting utilization by either reduction or feeding was about 30,000,000. These figures cannot be accepted as even approximate for methods of disposal in 1924, even after al-

lowing for increases in population. After the War some reduction plants were closed, there was probably a material net reduction in the population from which garbage is fed to hogs, and some of the incinerating plants closed during the War were reopened, some closed, and others built. The basic data collected by the Food Administration and reported by cities and States was printed in tabular form in the *Engineering News-Record* for Oct. 17, 1918.

In the United States, probably in much lesser degree in other countries, garbage and refuse disposal is in many respects the most unsatisfactory of the various municipal services. In Europe, work in this field is on a more permanent and generally satisfactory basis than in the United States. It is not so much the collection service that is bad in America, although that is incomplete in a large percentage of municipalities and often poor, as it is the final means of disposal. The incompleteness of the American service, both as to collection and disposal, is in part due to the variety and extent of the demands on American municipal treasuries, but the poorness of the service performed and the constant shifting from one method of disposal to another and the very frequent abandonment or at best the very poor operation of disposal plants is due most of all to the failure of American cities to regard the garbage and refuse disposal service, and for that matter the collection service as well, as essentially an engineering problem. Shift from one method of disposal to another, utterly inadequate operating service of disposal plants, and the abandonment of plants representing large capital investments are common; together they result in the waste of very large sums of money. So seldom does a city turn to an engineer experienced in garbage collection and disposal for preliminary studies to determine the best method to be adopted, for the preparation of plans and specifications, and for supervision of contracts, that there are very few engineers specializing in garbage disposal, compared with the large number of water-works and sewerage specialists.

Methods of Disposal Outlined. The chief methods of garbage disposal in use in various parts of the world in 1924 were dumping on land or into water; earth burial or covering with ashes instead of with dirt; incineration, with or without attempts at heat utilization, reduction, for the recovery of grease and fertilizer base, or in rare cases, for the conversion of garbage into stock food, which must still be considered as in the experimental stage; and fermentation, the end product to be used as a fertilizer, a new method introduced in several Italian cities and tried in a small way in the United States. Although no exact figures are available, it is probable that throughout the world more garbage and other municipal refuse are disposed of by dumping in land or in water than by any other method. Water dumping was long the chief method of disposal practiced by New York City; it was then given up for disposal by reduction for some years but was returned to with a political change in administration for a considerable part of the city. In Richmond and Queens Boroughs most of the New York garbage is disposed of by incineration and early in 1924 a 300-ton incinerating plant was put in use in Manhattan Borough;

at the same time another large plant was under construction, and presumably others were projected for that borough. The land dumping of garbage and refuse, if little or no attempt is made to take the proper care of the dumps, is likely to give offense from odors, from scattering papers, and from smoldering fires on the dumps, but it is possible so to handle the dumps as to keep them from being much of a nuisance. Earth burial or the depositing of garbage in relatively shallow layers and covering it with a few inches of earth, or covering it instead with ashes, may be an eminently sanitary and satisfactory method of garbage disposal. It has been in use for some years at Seattle, Wash., after the abandonment of three refuse destructors or incinerators, and similarly at Ottawa, Canada, and in other places. The change from incineration to dumping and covering with earth or ashes at Seattle was made by the Health Department and was called the sanitary fill method of disposal.

Incineration was for several decades the chief method of disposing of mixed refuse in England, where anything but dumping was used, but much British refuse was worked into the soil for its physical improvement and for such fertilizing value as the refuse might contain. Following the War a marked change was made in British incinerating or refuse destructor practice; instead of sending all the garbage, ashes, and other refuse through the furnaces, the ashes and garbage were screened out for utilization on land; such low grade commercial materials as paper, rags, etc., were picked out on movable belts, and only the coarser clinker and unburned coal was passed for burning. The same general method was practiced for several years at Paris in some degree and was being extended on a large scale to cover the mixed refuse of the entire city.

Municipal Methods. Collectors gather the Paris mixed refuse in a fleet of 700 motor trucks and deliver it to sorting, screening, grinding, and destructor plants operated by another company. The disposal company produces fertilizer and brick from the refuse and utilizes heat from the destructors for the generation of electricity, the latter being sold to the city and utilized to drive pumps of water and sewage pumping stations. The four separate disposal stations were being enlarged in 1923 to a destructor capacity of 122 metric tons an hour and a projected further increase in capacity will bring the latter up to 160 metric tons an hour (see *Engineering News-Record*, Nov. 22, 1923). Tests on the refuse of Munich made by the Bavarian State Institute for the Growth and Protection of Plants led to the conclusion that it would be wasteful to use for fuel the finer portions of refuse having low calorific value but rich in fertilizing material. It was concluded that the most economical use of refuse where soil deficient in humus is at hand is to devote sifted fine refuse to agricultural purposes and to send the remaining refuse only to the destructor (*Zeitschrift des Bayerischen Revisionsvereins*, Nos. 7 and 8, 1921).

Reduction as a means of garbage disposal has been confined almost wholly to the United States, where the method was employed during a considerable number of years in most of the larger cities of the country which have what might be called improved means of garbage disposal. Originally all these reduction works were built and operated by private companies

under municipal contracts, but for some years, one after another was taken over by the city or else, in a few cases, municipal plants were built *de novo* or to replace the old privately built plants. In 1924 there were municipally owned reduction plants in New Bedford, Mass.; Schenectady, Syracuse, and Rochester, N. Y., Philadelphia and Washington; Cleveland, Columbus, and Dayton, Ohio; Indianapolis, Ind., and Chicago. The Syracuse plant was leased for operation for a few years to the contractor who built it. Other cities where the garbage was being disposed of by reduction in 1924 were Boston, Baltimore, Pittsburgh, and Detroit. Where reduction is practised, only garbage, not mixed refuse, can be disposed of. The same is almost as true of disposal by feeding to hogs, although these animals will do much sorting over of mixed refuse.

Hog feeding as a method of garbage disposal was still in use in Newark and Buffalo in 1924, the Buffalo piggery had been taken over by the city a few years earlier, and the city was under a court injunction brought by the town in which the piggery was located, to close the piggery. The matter of actual closing was in the courts for some time pending investigations and negotiations by Buffalo for a site for disposal by some method not yet decided on up to May 1, 1924; the choice presumably lay between another piggery and incineration. Hog feeding is the general means of garbage disposal throughout New England; it was long practiced at Providence, R. I., and Worcester, Mass.

Fermentation by the Beccari system, named after an Italian, was practised in Florence and some other Italian cities for several years. A demonstration plant was built by American promoters of the process at Paterson in 1921. Late in 1923 a working-scale Beccari plant was put in operation by the village of Scarsdale, N. Y. It consists of four covered concrete cells, each about 8 x 9 feet in plan and 10 feet high, into which the garbage is dumped through openings in the top. A tower or chimney common to the four cells contains overlapping shelves on which is placed material designed to absorb the gases given out by the fermentation process, with a view to recovering any fertilizing value they may contain. The moisture in the garbage is drained out through a false bottom. Means are provided for introducing air to pass through the cells. Reports from the Italian plants are that after the garbage has remained in them for 30 days or so, it has been converted by fermentation to a substance similar to garden soil or humus, with a high fertilizing value. For a description of the Beccari system as used in Italy, see *Engineering News-Record*, Feb. 15, 1923, and for a description of the plant at Florence, see *The American City*, February, 1923.

Collection of mixed refuse generally costs more than the final disposal of the material; for economical service both of collection and of disposal, the two should be carefully correlated after engineering studies, which should be continuous in order to make readjustments necessary for economy and efficiency. Increasingly, motor-drawn vehicles are being used for collection, especially where there is a long haul after loading is completed. Theoretically refuse collection districts should be so laid out that the material collected could be hauled to a central disposal plant in each district; this would ma-

terially reduce the haul as compared with that entailed by the use of only one disposal plant. Great practical difficulty is experienced in American cities when an attempt is made to locate district disposal plants, the people residing or doing business in the immediate vicinity usually protest that the plant will be a nuisance. The arguments advanced may be fallacious, but when brought to bear on the councilmen they are likely to be effective, as was shown by experiences at Philadelphia, Minneapolis, and St. Louis. Most disposal plants in America are located in the outskirts of the city or beyond the municipal boundary lines. In some cases the disposal plant is so remote that special transportation after house-to-house collection has been effected is required, making use either of trailers or even of railway transportation, steam or electric. The latest and most comprehensive book on this whole subject is Hering and Greeley's *Collection and Disposal of Municipal Refuse* (New York City, 1921).

GARBER, DANIEL (1880-). An American painter (see VOL. IX). Among his later awards were the first Altman prize for figure painting, 1917, and the first Clark prize and gold medal, 1921. In "Buds and Blossoms," "A Summer Phantasy," and "The Hawk's Nest," he showed a continuance of interest in nature in her brighter and sunlit moods.

GARDEN, MARY (1877-). An American soprano (see VOL. IX). In January, 1921, she was appointed director-general of the Chicago Opera Association. She assumed control under most unfavorable circumstances, when the company was suffering from complications resulting from a dual directorship with divided responsibilities. That in the one year of her administration she failed to reconcile the warring factions and bring order out of the financial chaos is not surprising. In spite of all handicaps, she maintained the high standard of the performances and even added to the glory of the company with a tour which was an unequivocal artistic success, though it resulted in financial disaster. During her term as director she continued to appear in her usual rôles. When the new Chicago Civic Opera Company was organized in 1922, she was engaged as one of the principal artists.

GARDNER, EDMUND GARRATT (1869-). An English writer (see VOL. IX). Among his later works are *The Book of St. Bernard on the Love of God* (1916) and *The National Idea of Italian Literature* (1921).

GARFIELD, HARRY AUGUSTUS (1863-). An American educator, born at Hiram, Portage County, Ohio, the son of President James A. Garfield. He taught Latin and law and practiced law from 1888 to 1903 in Cleveland, Ohio. Subsequently he became professor of politics at Princeton University (1903-08) and president of Williams College (1908-). President Wilson appointed him United States Fuel Administrator in August, 1917. In this position Garfield did not receive the entire support of the public, because he did not favor public ownership of coal mines but asked for a fair chance for both capital and labor. The coal strike settlement did not receive his approbation, and in 1919 he resigned.

GARIBALDI, GIUSEPPE (1879-). An Italian soldier, son of the great Garibaldi, born in Melbourne, Australia. He took part in the Greco-Turkish War in 1897 and afterwards

fought with the revolutionists in Venezuela. Here he was imprisoned by Castro but escaped. After serving on the Panama Canal under General Goethals, he entered the service of Madero in Mexico and was made chief of staff. He served in the Balkan Wars of 1912, and at the outbreak of the War raised an Italian legion of 14,000, which fought with the Allied troops in France. When Italy entered the war, he joined the Italian army and served with great distinction. He was created brigadier-general in June, 1918, and retired from the army in June, 1919.

GARLAND, HAMLIN (1860-). An American poet and writer (see VOL. IX). Among his publications are *A Son of the Middle Border* (1914) and *A Daughter of the Middle Border* (1921). He became a member of the American Academy of Arts and Letters in 1918.

GARNER, JAMES WILFORD (1871-). An American professor of political science (see VOL. IX). Among his later writings are *Civil Government for Indian Students* (1920), *Idées et Institutions Politiques Américaines* (1921), *International Law and the World War*, 2 vols. (1920). He edited *Essays on Southern History and Politics* (1914). He was Hyde lecturer in the French universities (1921) and Tagore lecturer in the University of Calcutta (1922).

GARNETT, PORTER (1871-). A writer, critic and play producer, born in San Francisco, who has contributed to several San Francisco papers and literary and dramatic periodicals. He edited the *Grove Plays of the Bohemian Club* in 1918 and has published *The Bohemian Jinks*, *A Pageant of May*, *Descriptions of the Panama-Pacific International Exposition*, and *Stately Homes of California*. He became associate professor of graphic arts at Carnegie Institute of Technology in 1922 and established there in 1923 the Laboratory Press, the first private press devoted to educational purposes.

GAROFALO, RAFFAELE, BARON (1852-). An Italian jurist (see VOL. VIII). His publications after 1913, many of them speeches before the Senate, include *Sull' Ordinamento Giudiziario* (1914); *Le Aggressioni alla Forza Pubblica e i Delinquenti Abituati* (1914); *La Neutralità dell'Italia* (1914); *Per l'Assicurazione Obbligatoria contro gli Infortuni sul Lavoro in Agricoltura* (1917); "Enrico Pessina, Filosofo e Legislatore" (in vol. xlv of the *Atti della Reale Accademia di Scienze Morali e Politiche*, 1918); and *I Delinquenti Abituati, gli Scioperi, il Bolscevismo* (1919). His *Criminology* was translated into English in 1914 as the seventh volume of *Modern Criminal Science*.

GARRETT, ALEXANDER CHARLES (1832-1924). An American Protestant Episcopal bishop (see VOL. IX), who died at Dallas, Tex., on Feb. 18, 1924. On the death of Daniel Sylvester Tuttle in April, 1923, the Rt. Rev. Alexander Garrett became presiding bishop. At that time he was 91 years old and totally blind.

GARRETT, GARET (1878-). An American economist and journalist, born at Pana, Ill. He was financial writer on the *New York Sun* (1903-05), *New York Times* (1906-07), *Wall Street Journal* (1907-08), *New York Evening Post* (1909-12), editor of the *New York Times Annalist* (1912-14), assistant editor of the *New York Tribune* (1916-19), and financial writer of the *New York Evening Post* (1919-). He has written *Where the Money Grows* (1911), *An Empire Beleaguered* (1916),

The Blue Wound (1920), *The Driver* (1921), *The Mad Dollar* (1921), and many essays of an economic and political nature. Mr. Garrett has been described as a writer of stories with action and the freshness of bare facts. He contributed regularly to the *Saturday Evening Post* and other magazines.

GARRISON, FIELDING HUDSON (1870-). An American physician, known especially as a historian, librarian, and editor, born in Washington, D. C., and educated at Johns Hopkins and Georgetown Universities. He entered the army medical service. Having already served in that capacity in his student days, he was made an assistant librarian in the Surgeon-General's Library. On the retirement of Dr. Billings he succeeded him as head librarian. In 1903 he became editor of the *Index Medicus*. His chief publications comprise *An Introduction to the History of Medicine* (1913), a work of which it is impossible to speak too highly; *John Shaw Billings*, a biography (1915), and *Notes on the History of Military Medicine* (1922).

GARVIE, ALFRED ERNEST (1861-). A British Congregational theologian (see Vol. IX). He added to his numerous publications *The Missionary Obligation* (1914), *The Evangelical Type of Christianity* (1915), *The Purpose of God in Christ* (1919), *The Christian Preacher* (1920), *The Old Testament in the Sunday School* (1921), and other volumes.

GARVIN, JAMES LOUIS (1868-). An English journalist and Imperialist, born at Birkenhead, Cheshire. By his writings for the *Newcastle Chronicle*, the *Eastern Morning News*, the *London Daily Telegraph*, and the *Fortnightly Review*, he made himself popular as a brilliant publicist. He was editor of the weekly *Outlook* (1905-12), the evening *Pall Mall Gazette* (1912-15), and *The Observer* (1908). The circulation and prestige of the latter increased enormously with his editorship. He has published *Imperial Reciprocity* (1903), *Compatriot Club Lectures* (1906), *Tariff or Budget* (1909), *The Economic Foundation of Peace* (1919), and other books, the majority of them giving proof of his affinity with the Unionist party. In 1920 he was appointed to write the official biography of Joseph Chamberlain, whom he had supported since the latter's colonial secretaryship in 1895.

GARY, ELBERT HENRY (1846-1927). An American corporation official (see Vol. IX). In 1917 he was appointed a member of the United States section of the international high commission. He later resigned from this position.

GARY, HAMPSON (1873-). An American lawyer and diplomat, born at Tyler, Tex., and educated at the University of Virginia. In 1894 he was admitted to the bar and engaged in private practice and politics. In 1913-14 he was standing master in chancery in the United States District Court, and in the latter year became connected with the Department of State as a special war counsel. From 1917 to 1919 he was in Egypt as diplomatic agent and consul general, with the rank of minister resident. In 1919 he was in Paris with the American Commission to Negotiate Peace and in the following year was made Envoy Extraordinary and Minister Plenipotentiary to Switzerland. After 1921 he practiced law in Washington, D. C.

GAULT, ROBERT HARVEY (1875-). An American psychologist, born at Ellsworth, Ohio, Nov. 3, 1875, and educated at Cornell and Clark Universities. He has been a member of the faculty of Northwestern University since 1905. In 1911 he became the editor of *The Journal of the American Institute of Criminal Law and Criminology*. After 1914 he also edited *Criminal Science Monographs*. He was part author and editor of the report of the Chicago Council for the Investigation of Crime (1915).

GAUTIER, (CHARLES) LUCIEN (1850-). A Swiss theologian (see Vol. IX). He was president of the *Pastorale Suisse* (1916-17), central president of the *Société Suisse des Vieux Zofingiens* (1915-19), and president of the board of delegates of the South African Swiss Mission (1918-20). In 1919 he became a member of the International Committee of the Red Cross. One of his later publications was *Le Prophète Jérémie* (1916).

GAUVAIN, AUGUSTE (1861-). A French editor and publicist, born at Vesoul, and educated in law at the University of Paris and the *Ecole des Sciences Politiques*. After editing a professional legal journal, he became in 1908 foreign editor of the powerful and conservative *Journal des Débats*. His political articles were widely quoted on both sides of the Atlantic. During the War he was honored by the French government with the cross of the Legion of Honor; he also received honorary decorations from a number of foreign orders. A member of the Academy of Moral and Political Science, Gauvain was a prolific writer on questions of current politics. The list of his writings includes *Les Origines de la Guerre Européenne* (1915), *L'Europe avant la Guerre* (1917), *L'Affaire Grecque* (1917), *La Question Yougo-Slave* (1918), *L'Encerclement de l'Allemagne* (1919), and *L'Europe au Jour le Jour* (12 vols., six of which were crowned by the Institute). Gauvain also wrote Books I and III of the ninth volume of the *Histoire Contemporaine de France* and frequently contributed to the French periodical press.

GAYLEY, CHARLES MILLS (1858-). An American author (see Vol. IX). He was dean of the faculties (1918-20) and administrator (1919) of the University of California. Among his later works are *Shakespeare and the Founders of American Liberty* (1917) and, in collaboration, *Lyric, Epic and Allied Forms of Poetry* (1919).

GAYLORD, FRANKLIN AUGUSTUS (1856-). An American clergyman and social worker, born at Yonkers, N. Y., and educated at Yale University, Union Theological Seminary, and the Collège de France. In 1887-93, he was general secretary of the Young Men's Christian Association at Paris, France. In 1894 he was ordained to the Presbyterian ministry, and from 1895 to 1899, he held the pastorate of Trinity Congregational Church in New York City. He was in St. Petersburg as

the general secretary of the Russian Y. M. C. A. (1899-1911), and in 1911 he was made director of the Russian Society for Moral and Physical Development of Young Men. In 1916 he was secretary of the American Hospital for Wounded Russian Soldiers, and in 1918-19, secretary of the International Committee of the Y. M. C. A., which he also represented in Odessa, Russia (1919-20), and other cities. He is the author of English translations of Russian verse.

GEDDES, SIR AUCKLAND CAMPBELL (1879-). A British scientist and diplomat, educated at Edinburgh University. He was professor of anatomy at Edinburgh, Dublin, and Montreal (McGill University). He served in the South African War, and in the war of 1914-18, he was a brigadier-general in the Territorial Force. Appointed minister of national service in 1917, he showed great efficiency in utilizing the services of the whole nation in the prosecution of the War. In 1919 he was made president of the Board of Trade. In 1920 he was British ambassador at Washington. He resigned from this post in December, 1923.

GEDDES, SIR ERIC CAMPBELL (1875-). A British politician, born in India, and educated at Oxford Military College and Merchiston Castle School in Edinburgh. He first acquainted himself with railways in the United States (Baltimore and Ohio system) and later in England became manager (1906) of the Northeastern Railway Company, of which he was general manager on the outbreak of the War in 1914. After that time he was deputy and director general of munitions supply (1915-16), director general of military railways, and inspector general of transportation. The credit for the efficiency of British communication in France was attributed to him. Lloyd George, wholly ignoring the fact of Sir Eric Geddes' non-parliamentary experience, appointed him to succeed Sir Edward Carson as First Lord of the Admiralty. After the Armistice he was charged with the demobilization of many government departments, and on the formation in 1919 of a new Ministry of Transport, he left the Admiralty to preside over it. He was much criticized (1920-21) for his apparent lack of economy in the new ministry, in the contemplated government return of the railways to the original companies. In the spring of 1921 he introduced a bill for reorganizing the railways, and in the following August he was appointed by the Chancellor of the Exchequer adviser on all questions of national expenditure (August, 1921-March, 1922). Sir Eric was knighted in 1916 and in 1917 was created K.C.B. and G.B.E. In 1923 he was a member of the British War Cabinet and head of the British tire and rubber industry.

GEIKIE, SIR ARCHIBALD (1835-1924). A British geologist (see VOL. IX). Among his later writings are *The Birds of Shakespeare* (1916), *Annals of the Royal Society Club in the Eighteenth and Nineteenth Centuries* (1917), and *John Mitchell, M.A., F.R.S., of Queen's College, Cambridge (1724-93)* (1918).

GELL, WILLIAM EDGAR (?-1925). An American explorer and author, born at Doylestown, Pa., and educated at Lafayette College. He made journeys into Western Asia, China, and Africa, penetrating as far as Mt. Douglas, to study primitive races. He lectured on his observations in Australia, Japan, China, India, Great Britain, and the United States. In 1919-

20 he explored the five sacred mountains of China. Among his works may be mentioned *The Great Wall of China* (1911) and *Adventures in the African Jungle Hunting Pygmies* (1917).

GELLERT, GRETE MEISEL-HESS (1879-1922). A distinct personality among the women writers of Germany and Austria. She was born at Prague. Five years were spent at the university of Vienna in the study of philosophy, sociology, and biology; she was also a pupil of Freud. Her first works were novels, *Fanny Roth*, *Annie Bianca*, and *Die Stimme* (1907), and although they were later followed by *Die Intellektuellen* (1911), a picture of German intellectuals, and a volume of stories of the occult, *Geister* (1913), her reputation rests on her works on the sex problem, on woman, and marriage. They are *Die Sexuelle Krise* (1909), which has been translated into English; *Betrachtungen zur Frauenfrage* (1914), *Krieg und Ehe* (1916); *Das Wesen der Geschlechtlichkeit* (1916); *Die Bedeutung der Monogamie* (1917); and *Die Ehe als Erlebnis* (1919).

GEOGRAPHICAL SOCIETY, AMERICAN. A society established in 1852 for the dissemination of geographical information. From November, 1917, to December, 1918, it was the headquarters of a body of experts known as the Inquiry, which studied conditions in Europe during the War under the direction of the Department of State; later the director of the Society and some of these experts attended the Peace Conference where they served on various territorial and economic commissions. In 1919 the Society conducted a survey of the boundary between Guatemala and Honduras, at the request of the governments concerned, to be used as the basis for the recommendation of the Secretary of State of the United States for a final boundary in the disputed region. In the following year the Society inaugurated a programme of research in the geography of Hispanic America, the results of which were published in a map of Hispanic America on the scale of 1:1,000,000 accompanied by a series of explanatory monographs and articles. Plans adopted in 1921 for the foundation of a school to train men in modern methods of surveying were well advanced in 1924. The course, opened to qualified students, would require eighteen months; shorter courses would be arranged for students desiring to take them. The Society in 1921 assisted the Department of Justice in the study of the Red River Boundary in dispute between Oklahoma and Texas and in the same year sent W. L. G. Joerg on a mission to Europe for the purpose of studying the status of geography in European universities and geographical institutions.

In 1916 the *Geographical Review* (monthly 1916-1921; quarterly since 1921) superseded the *Bulletin of the American Geographical So-*

ciety as the organ of the Society. In 1916 a new series of publications in book and pamphlet form was begun: of these an average of more than one volume a year was published. The Society's library and map collection, which were considerably enlarged during the past decade, formed probably the most complete collections in America devoted exclusively to the subject of geography. In 1916 John Greenough succeeded Archer M. Huntington as president; Dr Isaiah Bowman was director after 1915.

GEOGRAPHIC SOCIETY, NATIONAL. An organization founded in 1888 for the increase and diffusion of geographic knowledge. Probably the most important of its activities between 1914 and 1924 was its investigation of the circumstances of the eruption of Mt. Katmai in Alaska, one of the greatest in modern times. Six expeditions sent out under Dr. Robert F. Griggs discovered the huge new crater of the volcano, eight miles in circumference, nearly large enough to engulf Vesuvius, and the remarkable Valley of Ten Thousand Smokes, the greatest fumarole region known. Besides investigating and mapping the valley, the expedition mapped a hundred miles of uncharted or erroneously charted coastline and discovered a new harbor and four large lakes. Collections of incrustations, gases, and lavas were brought back and studied in the laboratory, and the processes of reforestation of the ash-devastated area were studied by botanists. Through these researches it was hoped that new light might be thrown on the composition and condition of the materials in the earth's interior and the problems of vulcanology. As a result of the Society's activities, the region about Katmai was made a national monument by presidential proclamation.

An archaeological expedition under Dr Hiram Bingham was sent in 1914-15 to Machu Picchu, the ancient capital of the Incas, high in the Andes of Peru. The expedition unearthed a number of buried highways, towns, temples, etc., and showed that the region about the city was probably the most densely populated of the New World in pre-Columbian times. They discovered that the Incas made pottery resembling that of early Greece, performed surgical operations, built wonderful staircase forms, domesticated 80-odd species of plants, including potatoes and corn, and laid stones weighing tons with the utmost nicety. Over 12,000 photographs were taken showing Peruvian types and ruins, as well as geologic, topographic, and physiographic features of the Andes. Another expedition was sent to Chaco Canyon, N. M., to excavate Pueblo Bonito, a colossal apartment house at least 1000 years old, with 300 rooms on the first floor, and probably five stories high. Portions of the fourth story walls were still standing. Cross sections of the beams discovered there were expected to furnish much information concerning the age, history, and geographical position of the forests which supplied building materials used in the dwellings.

A biological expedition was sent to the interior of China to make a survey and especially to find a specimen of the largest nonanthropoid species of monkey known, the *rhinopithecus brelichii*, of which only one skin was extant. Other explorers, going to the Burma-Tibet frontier in search of plants, were especially successful in bringing to the United States blight-

resisting chestnuts. They also hoped to find how Indian corn was transplanted into China in pre-Columbian times, when it was known as imperial wheat. The Society participated in an expedition to the islands off the coast of Lower California, collecting marine fossils, plants, fishes, and rare forms of animal life, and in one to Labrador, which mapped a large and previously unknown area and collected biological specimens. Early in 1924, the Society dispatched an expedition to southern Mexico under the leadership of Prof. Byron Cummings to investigate and unearth the ruins of Cuicuilco beneath the Pedregal lava flow. It was believed that these excavations would disclose evidences of a civilization in America antedating that of the Pharaohs in Egypt.

The membership of the Society increased from 300,000 in 1914 to 900,000 in 1924. To fulfill its purpose of diffusing knowledge it published, besides its monthly magazine sent to all members, daily and weekly bulletins for the press, bulletins for schools and Sunday schools, and scientific monographs on the discoveries of the Katmai expeditions. The president and editor-in-chief in 1924 was Gilbert Grosvenor; vice-presidents, Henry White and John Oliver Lagorce; secretary, O. P. Austin. Headquarters were in Washington, D. C.

GEOLOGY. Progress in this science during 1914-24 was substantial, representing the efforts of many workers in the different departments rather than a few signal discoveries or researches. If anything may be described as distinctive in the general trend of studies, it was undoubtedly the emphasis on the practical phases, economic or political geology, for which the War may be held responsible. This tendency still may be discerned in the output of most public surveys, which were inclined to give less attention to subjects of theoretical interest than they formerly did and was further illustrated by the growing participation of geologists in industrial undertakings, chiefly oil and natural gas production and mining. In contrast with its stimulative influence on work in this field, the War was accountable for much that was wholly regrettable, including the suspension of coöperative effort on the preparation of a world map and other plans of international scope, as well as for the partial or complete demoralization of scientific activities in some of the European countries.

General Geology. Geognosy. The effects of radio-active energy on the cooling of the earth have been given a quantitative expression; they put a new aspect on estimates of geological time. The presence of radio-active substances in all the constituents of the crust may be regarded as definitely established by the work of Strutt and others. The heat given off in this way would appear to counterbalance almost completely the loss by conduction and radiation of the original stored heat: perhaps it exceeds such loss under certain conditions, so that the cooling process is very slow. Lord Kelvin's classic studies, made before the discovery of radium, indicated a maximum of 40,000,000 years for the age of the earth; that is, the time required for it to have cooled to its existing state, an estimate which geologists for the most part accepted, even though a more liberal figure would have accorded better with their own data. On the new basis the period of earth evolution would be lengthened to many

times that amount, and 1,000,000,000 years is regarded as not improbable. Arthur Holmes calculated from radium ratios that the oldest igneous rocks exposed at the surface, largely granites, probably originated 1,500,000,000 years ago. The fossiliferous rocks extending back to Cambrian time, which is the span of historic geology, were accumulated in a minimum of 550,000,000 and a maximum of 700,000,000 years, according to Barrell, who would assign a period of similar magnitude for the Pre-Cambrian formations.

That the earth as a whole has a high degree of rigidity comparable to steel, and is likewise extremely viscous, was deduced by Michelson from experimental observations of tidal movements in the solid rocks. The old theory of a thin envelope about a fluid body would appear untenable on a physical basis. It is probable that the interior is very hot, sufficiently so to melt any rock material under atmospheric conditions, but the pressure produces a degree of immobility approaching a solid for the body as a whole. Other indications of deep-seated conditions are found in the study of earthquake tremors, the heaviest of which are world-wide in their travels but do not pass directly through the earth in the shortest paths. They indicate a zonal structure. Oldham inferred that three concentric layers exist, of which the crust or lithosphere is the thinnest, not more than 40 miles in depth. The next layer, asthenosphere, is possibly 2000 miles thick and is rigid under stress of short duration so as to transmit vibrations from distant sources. The innermost layer, the core, is likewise very thick and seems to deflect tremors, indicative of a viscous condition rather than of a rigid solid. The temperature gradient calculated from observations made in deep shafts and borings affords a method of estimating the thickness of the crust. Daly collected data from Europe and America on which he based the conclusion that 40 kilometers (roundly 25 miles) is the most likely figure for the outer layer.

Experimentation with mineral melts analogous in composition to some of the simpler igneous rocks has provided some new information about the crystallization of these materials. One of the problems that has been given attention is the cause of variation in igneous intrusions, the process of magmatic differentiation, so-called. An original mass or magma of uniform composition may split during consolidation into several types of variant textures and mineral ingredients. Bowen would explain these effects as a result of the crystallizing process, itself a natural inherent influence in all magmas. The process may be considered as occurring in two stages, an early stage when crystal settling is the main feature, and a later stage in which pressure acts to compress the crystal mass and to squeeze out the residual liquid which is later cooled to the crystallizing point. The one or the other agency, or their combined operation, serves to explain magmatic differentiation. From theoretical considerations purely, other writers have argued in favor of the effects of liquid immiscibility, convection currents, and melting of foreign materials; and it is recognized that the subject is still open to investigation.

The structure of coral reefs, about which Darwin's theories have been generally accepted as most satisfactory, was given renewed consid-

eration by several geologists. Daly remarked certain features of atolls, for example the flat floors that characterize some of the basins enclosed by the rings of coral, which seem inconsistent with reefs built around subsiding volcanic islands. He suggested that the corals may have built upward on relatively flat platforms produced by wave cutting at a time when the sea was at a lower level than now. The water stored up in the form of ice during the Pleistocene period may have caused a lowering of tidal waters by as much as 150-300 feet, when waves could have eroded benches and platforms well below the present range of their activity. On them the corals started their operations anew as soon as the waters reached a favorable temperature.

According to Davis, the flat floors of atoll lagoons can be explained by the leveling effects of sedimentation in periods of intermittent subsidence of the islands; coral reefs also occur on many of the Pacific islands that bear no marks of a cessation of growth that would be expected if the seas had been lowered and cooled during Pleistocene time. Borings on the Funafuti atoll were interpreted by Skeats as evidencing a slow, progressive, upward growth, without any breaks in the succession of coral rock corresponding to the estimated position of a glacial platform. Most of the coral species found at depth still exist in the vicinity. The evidence from that locality supports Darwin's conclusions. In the West Indies and Florida, Vaughan found that all offshore reefs have grown on recently depressed platforms and that there are no instances of long-continued submergence of coral areas or of the development of barrier reefs from fringing reefs. The work of corals as constructional agents is not of first importance in that region; other organisms like bacteria, foraminifera, and mollusks contribute more to rock formation by abstraction of calcium carbonate from sea water.

Dynamic Geology. Isostasy has acquired rank as a working principle among most of the American geologists, apparently, who have given attention to the problem of slow crustal movements. The work of Hayford and later of Bowie, both of the United States Coast and Geodetic Survey, has given strong support to the theory. Accurate gravity determinations were assembled by Bowie from the United States, Canada, India, and other countries, representing all conditions of topographic relief, and they were found to fall in line with previous deductions. Isostasy, it may be explained, assumes that every variation of topographic relief is accompanied by a variation of density of the underlying rock column down to a uniform level, that of isostatic compensation. Thus, mountain areas are deficient in density, while oceanic depths are of relatively high rock density. Denudation of an elevated surface causes or is compensated for by a rising of the area, whereas loading of a depression is accompanied by sinking. Bowie regards the compensation as practically complete at a depth about 60 kilometers for the United States as a whole; in mountain regions the depth is greater, 95-111 kilometers. Compensation is effected by a flow of material at the mentioned depths, in accordance with the fluctuating load at the surface.

Exemplification of the broad crustal swings both up and down that seem to call for expla-

nation by the isostatic principle is to be found in the changes of level in northeastern North America during Pleistocene time. At the beginning of the ice invasion the region was higher than it has been at any subsequent period, although the exact relation of the surface with reference to sea level can be stated only in general terms. Over this surface, which was perhaps from 1000 to 5000 feet higher than now, spread a thick mantle of ice which collected first in the Labrador and Laurentian highlands and moved gradually to the south and southwest, finally covering an area of several hundred thousand square miles to an extreme depth of perhaps 5000 feet. Following the maximum ice accumulation, the land surface began to sink under the weight, the movement continuing until the ice had retreated from the southern part of the region and until a considerable area had been depressed nearly to sea-level and marine waters invaded a smaller portion of it. The general withdrawal of the ice from the whole region so lightened the crust that an adjustment by relevelation took place. This last movement has reached a maximum, according to Fairchild, of 1000 feet in the area between the St. Lawrence River and James Bay, the measurement being based on the altitudes of marine deltas formed by streams that flowed into the sea at the time of maximum depression. The elevation increased from south to north.

The relation of folds and faults to isostatic adjustment remains an outstanding problem, about which opinion, as yet, has found little common ground. The view that they represent the effects of stored-up stresses finding sudden relief is in apparent conflict with the evidences for a relatively thin crust that responds easily to variations of load. Folds and overthrust faults represent the effort of the crust to adjust itself to a shrinking circumference. R. T. Chamberlin, in a study of the Colorado Rockies, found that the amount of shortening was 8 miles in a distance of 140 miles across the axis of the main uplift. The depth to which the rocks were affected by disturbance ranged from 13 miles minimum to 107 miles maximum. In the Coast and Sierra Nevada ranges adjustments occurred mostly by faulting, according to Willis. The faults, which are high-angle thrusts, resulted from compression that brought about rotation of the mountain blocks along the fault planes. The cause of rotation was stress, set up by erosion and sedimentation, not sufficient to involve isostatic adjustment.

Kober explained mountain-making as an effect of compressive forces, which have their source in continued contraction of the earth. Adjustments have taken place by thrusting and folding in restricted zones, whereas the larger masses or plates of continental extent have behaved as rigid units. The zones of folding may receive an excess of material so as to be overloaded, when isostasy comes into play and the zones subside, possibly to an extent that brings them into the range of sedimentation. With a heavy accumulation of sediments the isogeotherms eventually begin to rise, and the increase of temperature sets in play chemical reactions and causes expansion, thereby upsetting equilibrium, which leads to adjustment by folding or thrusting. Crustal movements, in the view of T. C. Chamberlin, have not effected widespread interchanges of land and sea. The

continents and oceans are fixed in position, although migrations of shore-line have taken place frequently and are now in progress. Examples may be found of the engulfing of crustal blocks and folds, or of the upraising of the ocean floor into land, but they are isolated. The Antillean region, by its position between the two Americas and the two great ocean basins, has been particularly unstable, as instanced by the occurrence of deep-sea deposits on Barbados and other islands.

Metamorphism as an influence in the formation of mineral deposits is a subject to which practical students of geology have devoted much attention, with some important contributions to theory. One of the more significant results has been the broader recognition of the part played by igneous rocks in producing changes. Their field of operation, it is now regarded, may extend over such areas as are comparable to those of pressure or regional metamorphism, if, in fact, they have not been responsible for effects generally assigned in the past to the latter agency. Regions in which igneous rocks do not appear at the surface may still have been under their influence, for there is every reason to suppose that many deep-seated intrusions, like granite batholiths, are buried in the sedimentary layers out of sight. The heat, gases, and mineralizing solutions emanating from such bodies in the crystallizing stages would reach over extended zones, effecting those chemical and physical changes often ascribed to regional metamorphism. For the rôle of the igneous rocks in the formation of ores and valuable mineral deposits, see *Economic Geology*.

Stratigraphic Geology. The classification of the Pre-Cambrian formations in their order of sequence constitutes one of the outstanding problems of geology, about which a great deal of discussion has centred in late years, with many solutions proposed. Practically all students of the subject agree that the old idea of a dual division into Laurentian and Huronian or Archean and Algonkian, based on the thesis that there exists an earlier group of igneous rocks, chiefly granite, on which rests the altered sedimentary Algonkian or Huronian group, does not reflect the real conditions. Actually, the succession is much more complex than that, for sediments seem to have been laid down at recurrent intervals all through the Pre-Cambrian, and there are igneous formations of several different periods of intrusion. The sequence varies, also, between one region and another, and it is doubtful if any classification can be made, adapted to meet all conditions. The tendency now is to apply such methods and terminology as corresponds best with the local features and not to attempt to correlate the formations of one area, like that of Lake Superior, for example, with the Pre-Cambrian of Great Britain or Scandinavia. For the arrangement given in the article *Geology*, in the 1915 Edition of the *NEW INTERNATIONAL ENCYCLOPÆDIA*, may be substituted the following scheme, which is fairly representative of the later research in the Pre-Cambrian areas of the eastern United States and Canada. The formations are named in order of age, the oldest being at the bottom:

6. Keweenawan. Continental sediments and lavas.
5. Animikian. Marine sediments. Iron ore formations of Lake Superior.

4. Huronian Marine and continental beds.
3. Algomian. Later Laurentian granites.
2. Sudburyan Marine deposits
1. Basement Complex. Includes first Laurentian granites, Grenville schists and limestones, Keewatin greenstones, and Couchiching schists. Sequence still undetermined.

The climate of past ages may be inferred, according to Schuchert, from the character of the sediments and of the fossils contained in them. Life forms have always been responsive to climatic influences, just as they are now. There is evidence of widespread glacial climates during at least four periods, two of them occur in the Pre-Cambrian and two in later periods. In the lower part of the Huronian of Canada are found slate conglomerates, which represent hardened boulder clays. In the later Pre-Cambrian, glacial conditions are indicated by the tillites of Norway and southern Australia. The Permian period contains evidences of extensive glaciation in the equatorial and south temperate zones, notably in South Africa, Brazil, India, and other countries. The Pleistocene was the last of the great glacial periods. Changes of land surface are mainly responsible for the wide variations of climate; other causes are the variable supply of heat stored in the oceans and the fluctuating content of carbon dioxide in the atmosphere.

In many parts of America the Cretaceous system shows no well-defined natural boundaries between the Jurassic system below and the Tertiary system above. It appears that no general unconformability reflecting a widespread earth movement exists at the close of the Jurassic, but sedimentation seems to have been continuous in one area or another. Thus, the Morrison formation of the Rocky Mountain region has been considered by some geologists to be of upper Jurassic age, by others lower Cretaceous, and by still others as containing members of each of the two systems. Correlation with the European Cretaceous is suggested by Osborn as the best method of settling the difficulty; he would place most value on the evidence of fossils. On the question of drawing a line between the Cretaceous and Tertiary systems, the consensus of opinion is to make the close of the Cretaceous coincident with the passing of the age of reptiles, indicated by the extinction of the great families of terrestrial dinosaurs. This view accords with the classification adopted by European geologists. As applied to the formations of the west, the plan is to draw the limits at the top of the Lance formation and to place the Puerco and Torrejon beds containing the remains of the oldest mammals in the Tertiary system.

Structural Geology. Can the varied elements of earth structure be fitted into a broad plan expressive of the origin and history of the separate features? This is the problem that underlies the more interesting or significant studies in the recent literature of structural geology, for which the notable contributions of Eduard Suess have been both incentive and guide. A later work is Kober's *Der Bau der Erde* (1921), which develops the theory that there are two fundamental units of crustal structure, great rigid plates serving as buttresses to movement and narrow elongated zones, separating the plates, of weak or labile nature. The latter serve for relief of deformative forces set up by the shrinkage of the crust; they define the position of geosynclines

and of the great mountain systems, shifted somewhat in the course of geological time. Such zones, or orogens, are frequently defined by two parallel mountain systems with folds overturned away from each other toward the adjacent rigid plates. Between the parallel systems are broad intermontane regions of little folding. A cross-section of an orogen is more or less symmetrical, although each mountain system by itself has the asymmetrical structure so well described by Suess. The Pyrenees, Alps, Carpathians, Balkans, and Caucasus make up one parallel system, and the Apennines, Dinaric Alps, the Hellenic, Taurus, and Iranian mountains make up the other, the former overthrown to the north and the latter to the south. Kober believes a similar orogen may be found in the Rocky Mountains on the one side and the Sierras and Coast ranges on the other; also in the Andes as the eastern member of a zone of which the western part has foundered and disappeared in the Pacific. The existence of westward overfolding in the Appalachians is regarded as indicative of an eastern submerged member, now a part of the continental shelf.

Detailed studies of the structure and history of the Appalachian and Rocky Mountain systems were presented before the Geological Society of America (*Bulletin*, June, 1923). Although written for the specialist, the papers contain summaries of interest to the general student.

Observations in regard to the levels of marine beaches in northeastern North America have practically demonstrated a widespread uplift of the land surface since glacial time. Fairchild found that the rise between the St. Lawrence River and James Bay amounted to as much as 1000 feet. There has been a differential warping of the surface, the elevation increasing from south to north, with an uparching into a dome south of James Bay. Raised beaches on the west coast of Greenland and in Ellesmere Land, according to Ekblaw, may be assigned to a similar uplift since the glacial period, the maximum being about 650 feet.

Economic Geology. This department felt the effects of intensive activities in nearly all its branches, mining geology, oil geology, and underground waters and engineering phases of geology. One of the economic sequels of the War was an increased public and national interest in mineral resources, and there was a general stock-taking in these possessions all over the world. The control of the undeveloped oil fields became a matter of especial concern among the larger nations, with the realization that they were certain to play a considerable part in future commercial and naval operations. The location and development of petroleum fields had become almost a distinct department of geology, with its own technic and practitioners, who had extended their operations into the remote corners of the globe.

Out of the great volume of contributions on economic subjects, a few only may be selected for mention in this review. In the group of general works may be named the *Atlas of Economic Geology* (1921), published by the United States Geological Survey. It is a study of the geographic distribution of the valuable minerals and brings out clearly the political aspects of the world's supplies. It will be noted that the United States is well endowed in most of

the basic materials like coal, iron ore, copper, lead, zinc, and oil, but still has no adequate resources of potash or nitrate and is absolutely dependent on other countries for nickel, platinum, and tin. Great Britain with its colonies and its strong commercial position in other countries controls the precious metals and in the future is likely to dominate the oil situation. *Political and Commercial Geology and the World's Mineral Resources* (1920) is a compendium of statistics and special articles on the important minerals by American writers. In the same category is a series of short monographs by various British authorities, on the mineral resources of the Empire, which have appeared from time to time.

In the list of textbooks for students, prominent place should be given to the translation of Beyschlag. Krusch, and Vogt's comprehensive treatise, of which the English version, *The Deposits of the Useful Minerals and Rocks: Their Origin, Form, and Content* (1916), was made by Truscott. Leith's *Economic Aspects of Geology* (1921) and Emmons' *General Economic Geology* (1922) also were intended for students. Grabau's *Principles of Salt Deposits* (1920) was the most important contribution of recent date on the salines: potash, soda, and magnesia salts. Lindgren's *Mineral Deposits* appeared in a second edition (1919). Works on oil geology include *American Petroleum Industry* (1916) by Bacon and Hamor, and *Practical Oil Geology* by Hager (1916). Both of these cover such technical matters as mapping, drilling, and oil production, as well as the study of the occurrence and distribution of petroleum.

The control of geological structure on the accumulation of oil-pools has been worked out so completely that it is now a well established principle, which is directing the search in all new fields. Less is known about the motive force that impels the oil in its travels underground. McCoy has sought to explain this by capillary action, on the basis that water has a greater capillary force in small openings than oil has and consequently drives the latter ahead of it into the larger openings, which are found under domes. Other geologists have sought explanation in hydrostatic pressure and in gravity: in any event it is well known that in most accumulations underground waters have an important bearing on the localization of the oil. Another direction pursued by recent investigation is the relation between the character of oil and the degree of alteration or metamorphism of the enclosing rocks. Strata that have been much altered by compression or heat have lost their oil. An indication of the possibilities in this regard may be obtained, according to David White, by estimation of the fixed carbon ratios in the shale or coal that overlies the oil horizon: if the ratio exceeds 75 per cent of the total carbon there is little likelihood of a productive pool. Formations with a relatively high fixed carbon yield oils of the lowest gravity and most commercial value. Formations with lignitic beds are characterized by the lowest grade oils of all. It would appear that as organic matter is altered into substances having progressively higher carbon, through the elimination of oxygen, nitrogen, and a portion of the carbon, the distillates in the rocks become progressively higher in hydrogen.

For the study of ore deposits the most sig-

nificant feature in the contributions of the last decade has been the general trend toward the igneous or magmatic theories of vein origin, as opposed to the explanation by meteoric (atmospheric) waters which once received wide acceptance. Although nearly all writers are agreed that the intrusive rocks have supplied the materials out of which veins were formed, there is not the same unanimity of opinion about the methods by which the minerals have been transported and finally arranged in the veins and lodes. It is recognized, however, that certain kinds of ores, magnetite, for example, may originate by direct cleavage or differentiation of the igneous rock during the crystallizing stage. These occur in their original environment.

On the other hand many deposits, like those of gold, silver, copper, lead, and zinc, are often found at some distance from any intrusion that can be regarded as source and in formations distinctly older than the deposits themselves. For such it is obvious that the ores must have been transported in fluid or molten condition out of the parent magma. The agency may have been highly heated waters and gases evolved by the intrusion in cooling, the fluids passing upward and outward from regions of high pressure to those of low pressure; this is the view commonly accepted. With the gradual cooling and relief of pressure of the mineralized solutions as they move away from their source, the dissolved substances are deposited in the reverse order of solubility, and there results a general zonal arrangement which is frequently illustrated by the change of the mineral contents of veins in passing downward from the surface or outward from the igneous mass. This is the barest outline of the prevalent theories. A more detailed presentation will be found in the textbooks on mineral deposits already enumerated, and in the recent work by Spurr, *The Ore Magmas* (1923).

GEORGE, GRACE (1880-). An American actress (see Vol. IX). She established the Playhouse Company in repertoire in 1915 and starred in *The New York Idea*. Her later starring vehicles included *Major Barbara*, *The Earth*, *Captain Brassbound's Conversion* (1915-16), *Eve's Daughter* (1917), *L'Elleation* (1917-18), *She Would and She Did* (1919), *Quick Work* (1919), *The Ruined Lady* (1920), *The New Morality* (1921), *Marie Antoinette*, *To Love*, *The Esquise Hour*, and *All Alone Susie*.

GEORGE V (GEORGE FREDERICK ERNEST ALBERT) (1865-). King of Great Britain and Ireland and of the Dominions beyond the Seas and Emperor of India (see Vol. IX). During the War, King George set an inspiring example by cutting down his personal expenses and by contributing freely from his private purse to relief work. In 1917 he renounced all German titles.

GEORGE WASHINGTON UNIVERSITY.

A coeducational nonsectarian institution at Washington, D. C., founded in 1821. The university increased its enrollment from 1347 in 1913 to 4652 in 1923-24. The faculty was increased from 234 in 1916 to 321 in 1923-24 and the productive funds from \$104,670 to \$554,052. During the decade there were four different presidents; Charles Herbert Stockton, Ph.D., was succeeded in 1918 by William Miller Collier, L.H.D., LL.D., who held office until 1921, when Howard Lincoln Hodgkins, Ph.D., became president pro tempore and was succeeded in

1923 by William Mather Lewis. A law school building was bought and equipped in 1920, three lots were bought in 1919, and a large bequest of real estate was left to the university in 1921 by Gen. Maxwell Van Zandt Woodhull. A fund for the education of Filipinos was established in 1918 by Mrs. Larz Anderson.

GEORGIA. Georgia is the twentieth State in size, covering 59,265 square miles. and the twelfth in population; capitol, Atlanta. The population increased from 2,609,121 in 1910 to 2,895,832 in 1920, a gain of 11 per cent. The white population increased from 1,431,802 to 1,689,114; Negro, from 1,176,987 to 1,206,365; native white, from 1,416,730 to 1,672,928; and foreign born, from 15,072 to 16,186. The urban population of the State showed an increase of from 538,650 to 727,859; the rural, from 2,070,471 to 2,167,973. The growth of the principal cities was as follows: Atlanta (q.v.), from 154,839 to 200,616; Savannah, from 65,064 to 83,252; Macon, from 40,665 to 52,995; and Augusta, from 41,040 to 52,548.

Agriculture. As Georgia is one of the leading cotton-producing States, the ravages of the boll weevil during the decade 1914-24 greatly affected agricultural conditions. The pest had practically covered the State by 1916. Its effect will be indicated by a comparison of acreage and production for various years during this period: in 1913, 5,318,000 acres and 2,317,000 bales; in 1917, 5,193,000 and 1,884,000; in 1919, 5,220,000 and 1,860,000; in 1921, 4,172,000 acres and 787,000 bales. In 1923 the estimated production was 700,000 bales. In the southern part of the State the yield in 1922 reached a record low mark. For the general effects of the boll weevil on agriculture during the decade see the articles **BOLL WEEVIL** and **COTTON**.

While the population of the State increased 11 per cent in the decade, the number of farms increased by 6.8 per cent (from 291,027 in 1910 to 310,732 in 1920). In 1910 the total acreage of land in farms was 26,953,413, as compared with 25,441,061 in 1920. The improved land in farms increased from 12,298,017 acres in 1910 to 13,055,209 acres in 1920. While the total percentage of land in farms declined from 71.7 per cent in 1910 to 67.7 in 1920, the percentage of improved land increased from 45.6 to 51.3. The total value of farm property in the State showed an apparent increase, from \$580,546,381 in 1910 to \$1,356,685,196 in 1920; and the average value of farm property from \$1995 to \$4366. In interpreting these values, however, and, indeed, all comparative values in the decade 1914-24, the inflation of currency in the latter part of that period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the 310,732 farms in 1920, 102,123 were operated by their owners; as compared with 98,628 in 1910; 1655 by managers, as compared with 1419; 206,954 by tenants, as compared with 190,980. The white farmers in 1920 numbered 180,545, as compared with 168,468 in 1910; colored farmers, almost entirely Negroes, 130,187, compared with 122,559. Farms free from mortgage in 1920 numbered 64,061; in 1910, 78,004. Those under mortgage numbered 23,135 and 18,257 in 1920 and 1910, respectively. The number of dairy cows increased from 405,710 to 484,122; "beef cows," from 245,303 to 282,067; mules, from 294,985 to 406,351 in

1920; while sheep decreased from 153,250 to 72,173. The number of swine rose from 1,836,246 in 1910 to 2,178,914 in 1920, this increased production of pork being typical of a change to more diversified farming, with a larger production of food used in the State. The estimated production of the chief farm crops in 1923 was as follows: corn, 50,828,000 bushels; wheat, 1,739,000; oats, 9,042,000; potatoes, 1,558,000; sweet potatoes, 11,598,000; tobacco, 12,067,000 pounds; hay, 513,000 tons; and peaches, 5,716,000 bushels. Comparative figures for 1913 are: corn, 63,023,000 bushels; wheat, 1,708,000; oats, 9,240,000; potatoes, 972,000; hay, 350,000 tons; and tobacco, 1,800,000 pounds.

Mining. Georgia is not important as a mineral-producing State. It has practically no metal mining, and of the non-metals, the most important are clay products, stone, fuller's earth, and cement. There is also produced a small quantity of coal, a considerable amount of bauxite, mineral waters, iron ore, and mica. The comparative value of the clay products and other minerals in the decade 1914-24 will be seen in the following figures. In 1914: clay products, \$2,263,034; stone, \$2,238,789; coal, 166,498 tons. In 1917: clay products, \$2,426,671; stone, \$1,797,098; coal, 119,028 tons. In 1920: clay products, \$5,572,999; stone, \$3,651,415; coal, 50,156 tons. In 1922, clay products, \$4,157,601; stone, 3,349,293; coal, 60,636 tons. The total value of the mineral production in 1921 was \$8,650,003; in 1920, \$12,178,695; in 1919, \$9,429,972; in 1918, \$8,312,051; and \$5,704,856 in 1914.

Manufactures. Georgia has shown a steady increase in the value of its industrial products in the last three census periods. In 1919, 12 cities of more than 10,000 inhabitants, forming 18 per cent of the total population, reported 45.7 per cent of the value of the State's manufactured products. There were in the State in 1909, 4792 manufacturing establishments; in 1914, 4639; and in 1919, 4803. The persons engaged in manufacture numbered 118,036, 118,565, and 141,012; and the capital invested in those years amounted to \$202,777,665, \$258,325,811, and \$448,700,194, respectively. The value of the products rose from \$202,863,262 in 1909 to \$253,270,511 in 1914, and in 1919 to \$693,237,097; but this increase was in great measure due to changes in industrial conditions brought about by the War. The increase shown in the average number of wage earners, however, indicates a considerable growth in the manufacturing activity of the State. The most important industry in point of value of products is the manufacture of cotton goods, the value of which in 1909 was \$48,037,000; 1914, \$59,982,000; 1919, \$192,186,000. Cottonseed oil and cake rank second, with products valued in 1909, at \$23,641,000; 1914, \$32,715,000, and 1919, \$99,320,000. Fertilizers, in third place, amounted in 1909 to \$16,800,000; 1914, \$29,046,000, and 1919, \$47,480,000. Lumber and timber products were fourth: in 1909, \$24,632,000, 1914, \$22,115,000; and 1919, \$43,066,000. The chief manufacturing city of the State is Atlanta, where in 1909 were 483 manufacturing establishments; in 1914, 423, and in 1919, 503, with products valued at \$33,038,000, \$41,279,000, and \$113,992,000, respectively. Savannah, ranking second in industrial importance, had 135 establishments in 1909, with a product valued at \$6,540,000; in 1914, 128 with \$6,343,-

000; and in 1919, 146 with \$18,087,000. In Macon there were 79 establishments in 1909, 70 in 1914, and 135 in 1919, with products valued at \$10,052,000, \$18,867,000, and \$57,721,000 in those years.

Education. The development of education in the State in the decade 1914-24 was marked. A notable aid in this was the passage by the Legislature of 1918 of an act codifying the school laws of the State: providing for a State Superintendent of Schools, a State Board of Education, and a State Board for Vocational Education. Laws for the consolidation of schools were passed by a later Legislature. In 1920 an act was passed providing for the physical education and training of pupils; so was a compulsory school attendance law; and in the same year the provisions of the Smith-Hughes Law, giving Federal assistance to the States for vocational education, were accepted. The Legislature of 1922 conferred on several counties of the State authority to levy taxes for vocational purposes; provided for the employment and pay of county agents and home administration agents, and for the employment and payment of agricultural teachers and home economics teachers in vocational high schools. The total enrollment in the schools of the State in 1913 was 590,808; in the white schools, 360,554; and in the colored, 230,254. The total enrollment in the white schools in 1922-23 was 470,242; in the colored schools, 275,193. In that year the total number in the primary and elementary grades was: in the white schools 411,744; in the colored schools, 272,072; a total of 683,816. In the white high schools were enrolled 58,498, and in the colored high schools 3121; a total of 61,619. In 1919-20, according to the census of the Bureau of Education, there were enrolled in the elementary and kindergarten schools 645,790; in the secondary schools, 45,128. No school census had been taken in the State later than 1918. The percentage of illiteracy in the State decreased from 24.1 in 1910 to 18.4 in 1920; among the native white population, from 9.2 per cent to 6.7; among the foreign born whites, from 5.9 to 5.6; among the colored, from 43.8 to 35.8.

Finance. See STATE FINANCES.

Political and Other Events. Georgia remained strongly Democratic in politics in the decade 1914-24. Within that period there were spirited conflicts between different factions which contributed considerable political activity and excitement. In 1914, following the death of Senator Bacon, William S. West was appointed to serve out his unexpired term. The latter's death and the expiration of the term of Senator Hoke Smith in March, 1915, made it necessary to elect two senators in 1914. Senator Smith was reelected and Thomas W. Hardwick, a representative in Congress, was elected to fill the term of Senator Bacon. Nathaniel E. Harris was elected governor. Political events in 1915 were subordinated to the agitation in the case of Leo M. Frank, a manufacturer, who in 1914 was tried and convicted of the murder of a young girl in Atlanta. He was sentenced to be hanged on June 22, but an appeal was taken by his counsel to the United States Supreme Court, which refused to interfere, declining to order a writ of habeas corpus. Petitions were circulated throughout the State and other parts of the country for commutation of sentence, and hearings were held

by the State Prison Commission. This body declined to recommend the commutation of the death sentence. Disregarding this action, Governor Slaton commuted Frank's sentence to life imprisonment. For several days the governor's home was threatened by mobs. On June 26 he retired from office and was succeeded by Nathaniel E. Harris. On August 16, Frank was seized in prison by a band of men, carried to an isolated spot, and hanged. This act was denounced by the officials of the State and by Governor Harris. The Grand Jury carried on investigations, but no clew to the instigators of the deed was found. The activities of 1916 centred about the election of a governor. Hugh M. Dorsey, who had acted as prosecutor in the case of Leo M. Frank, received the nomination and was elected. In the presidential election of this year, President Wilson received 125,831 votes and Charles E. Hughes 11,225 votes. The Prohibition laws of the State were upheld by the court on Jan. 12, 1916, and on May 1 these laws went into effect, making the selling of liquor much more difficult than under the former law. On Mar. 22, 1916, a serious fire swept over a large area in Augusta and destroyed many business blocks and residences. The loss was over \$5,000,000. In 1917 an investigation of the lynching evil was carried on by a commission appointed by the governor. The report of the commission declared that the number of lynchings in the State was grossly exaggerated. On Mar. 21, 1917, a disastrous fire in Atlanta destroyed a considerable portion of the city and caused a property loss of about \$5,500,000. Elections were held in 1918 for United States senator. Senator Hardwick was defeated for renomination by William J. Harris, who was later elected. In the presidential voting of this year, James M. Cox received 107,162 votes and Warren G. Harding 42,730. In 1920 Mr. Hardwick was elected governor. He took office on June 25 and promised to "vindicate the majesty and impartiality of the law." In 1922 Governor Hardwick was defeated for the renomination by Clifford L. Walker, who was elected. On Oct. 3, 1922, Mrs. W. H. Felton was appointed United States senator to succeed Thomas E. Watson, deceased. She was the first woman to hold such a position. The appointment was purely honorary, as the election was held for senator within a few days, and Walter F. George, former judge of the State Supreme Court, was elected, defeating former Gov. Thomas W. Hardwick and two other candidates. The presidential primary elections were held in the State in March, 1924. The Democratic candidates were Senator Oscar W. Underwood and William G. McAdoo, the latter winning a majority of the votes and being thus assured of the 28 votes of Georgia in the Democratic convention. Mr. McAdoo was born in Georgia.

Legislation. The Legislature of Georgia meets biennially, in even years. In 1918 the Legislature of June 26 ratified the Federal Prohibition Amendment, authorized the codification of school laws, provided a budget system, and passed measures providing for aid to returned soldiers. Departments of warehouses and archives and history were created. In 1922 the Legislature amended the motor-vehicle law, increased the tax on gasoline to \$0.03, created a committee to consider tax measures, and

amended the school laws to provide for Bible reading in the schools.

GEORGIA, SOVIET REPUBLIC OF. One of the three Transcaucasian republics that emerged in 1917. It is made up of the former Russian governments of Tiflis and Kutais and the districts of Batum and Artum. Its boundaries enclose an area of 25,520 square miles, its population in 1920 was put at 2,372,403. The people were largely Christians and belonged to a distinct racial group called Georgian. The existence of this racial consciousness together with remnants of a certain political solidarity, whose inspiration centred in an 18th century Georgian kingdom, made for an advanced cultural outlook. Georgians, speaking a common language and possessing a tradition, looked down on the Armenian traders of the towns and the unruly Tatar mountaineers to the north. The capital, Tiflis, had a population of 346,766 (1915). Other cities were Kutais (85,151), Sukhum (61,974), and Batum (39,000). A university with six faculties was founded at Tiflis in 1918 and in the next year had 45 professors and 1500 students.

Industry and Trade. Agriculture engaged the attention of 90 per cent of the population, most of whom were a small peasantry as a result of the partition of the large estates. Corn was the most important crop, though other grains received attention. In 1915 all these yielded 30,000,000 poods (1 pood = 36 pounds). Cotton, silk, tobacco, the vine, fruits, were other agricultural products. Because of the primitive means of tillage the agricultural possibilities of the country were scarcely touched. After the Russian Revolution the disorganized life of the country led to a great dearth of food-stuffs, so that in 1920 the estimated deficit was placed at 21,700,000 poods in Tiflis and Kutais alone. Its economic wealth, however, was established in its mineral deposits. The greatest manganese deposits in the world, producing 44 per cent of the world's supply in 1913, were to be found at Chiaturi in the basin of the Kuiril River. Production, which had been about 66,000,000 poods annually before the War, fell to 3,300,000 in 1919 but rose to 7,800,000 in 1923. Other minerals were naphtha, copper ore, coal, lead, and iron ore. It was estimated that the country had available for use in industry 4,000,000 horse power in its rivers. All the basic industries were nationalized by the Soviet régime and the following were used for purposes of exchange in foreign markets: manganese, timber, tobacco, silk, and copper. There were 970 miles of railways. A through line, extending across the country, connected Batum and Poti on the Black Sea with Baku on the Caspian Sea, by way of Tiflis. Branch lines ran to the coal mines of Tkhibuli, the manganese mines of Chiaturi, the mineral springs of Borjom, as well as to Signakh, Telavi, and the Armenian frontier. By way of Batum communication was possible with the whole Caspian country, as well as Asia Minor and Central Asia. A pipe line connecting Batum with Baku brought Europe into contact with the rich oil fields of Azerbaijan. In 1919 steamers opened regular service between Batum and Marseilles, British ports, Italian ports, and New York.

History. After the Russian Revolution, representatives of the three Transcaucasian states gathered at Tiflis, Georgia, and there on

Sept. 20, 1917, founded the federal republic of Transcaucasia. It was inevitable, however, that the three states should go their separate ways. Georgia's attempt to rule the destinies of the new state, Azerbaijan's essentially Islamic outlook, and Erivan's territorial ambitions, were the rocks on which the federal republic foundered. On May 26, 1918, with the Bolsheviks in Baku and the Turks in Batum, as a result of the Brest-Litovsk Treaty, the federal republic was dissolved. On the same day the Georgian National Council proclaimed the independence of Georgia. Thenceforth, to the conclusion of the War, Georgia, because of a compact made with Germany, remained a dependency of the Central Powers, with its ports, mines, and railways in the possession of German and Turkish forces. By the armistice of October 30 the country was cleared of German and Turkish troops, only to find itself policed by British. A British force entered Batum in December, and for presumably strategic reasons, seized the railways of the country. Control was not relinquished, and evacuation did not come until the summer of 1920.

From 1920 until 1922 affairs never remained peaceful for long. In 1919 Georgians had been menaced by General Denikin's forces; but with the passing of this peril, in the spring of 1920, a Russian Soviet army pushed its way into Transcaucasia. Baku fell and Tiflis must have yielded too, had it not been for the distraction which the opening of the Polish campaign afforded. Russia for the time granted Georgia peace, even promising the Batum region despite the claims of the Turkish Nationalists. But the necessity for a Turco-Russian understanding with respect to a common frontier again made the region the scene of military operations late in 1920. The Turks invaded Erivan and with much bloodshed subdued the population. The Bolsheviks, following soon after, overthrew the republican government and established a Soviet republic. The procedure in Georgia was very much the same. A Turkish army entered the country and occupied Batum against practically no resistance, while Russian troops invaded from the opposite direction and fostered Bolshevik uprisings in the towns. On Jan. 27, 1921, Georgia received belated *de jure* recognition from the Allies. In the course of a few months, however, the Constituent Assembly was dispersed, the Social Democratic government headed by Jordania was in flight; and supported by Russian arms, a Soviet government, established by Mdivani in March, ruled the country. Batum was restored to Georgia by a Russo-Turkish treaty in March, 1921. In December, 1921, the young republic was incorporated with the Armenian and Azerbaijan Soviet republics into a Transcaucasian federation, with its capital at Tiflis, with Tiflis taking orders from Moscow. Thus by the end of 1921, Russia again dominated the political and economic life of her old Transcaucasian governments. This state of affairs received full legal sanction in the treaty of Dec. 30, 1922, which was signed by Russia, the Ukraine, the three Transcaucasian Soviet republics, Bokhara and Khiva, and which set up the Union of Socialist Soviet Republics. With the treaty's promulgation, Georgia's history as an independent political state ended. See AZERBAIJAN, ARMENIA, RUSSIA.

GEORGIA, UNIVERSITY OF. A State institu-

tion at Athens, Ga., founded in 1785. The student enrollment increased from 632 in 1914 to 1618 in 1923-24. The endowment in 1923 was \$433,000, and the income was \$85,000 from State appropriations and \$175,000 from other sources. During the 10-year period about \$400,000 was spent on the erection of new buildings. The alumni subscribed over \$1,000,000 for endowment and the building programme. Memorial Hall, erected in memory of those alumni who fell and those who served in the War, was being completed in 1924 at a cost of \$275,000. Chancellor, David C. Barrow, LL.D.

GEORGIA SCHOOL OF TECHNOLOGY.

An institution for scientific and technical education, founded in 1888 at Atlanta, Ga. It forms a part of the University of Georgia. The enrollment of the school increased from 1002 in 1914 to 1865 in the year 1923-24, the faculty from 62 to 138 members, and the library from 13,000 to 17,000 volumes. A power station and engineering laboratory, and an addition to the mechanical engineering building were built in 1920, the building for the departments of physics and architecture was completed in 1923, and plans were approved for a building for the School of Ceramics. A campaign for the improvement of the plant netted over \$1,000,000 in 1922. Marion Luther Brittain, LL.D., succeeded K. G. Matheson, LL.D., as president in 1922.

GÉRALDY, PAUL (1870-). A French playwright, best known in America for two works. *Aimer* was produced in New York with Grace George in 1922, under the title *To Love*. *The Nest*, adapted by Miss George from his *Voces d'Argent*, was played in New York in 1922. He has written much for periodicals, including *Vanity Fair*.

GEBARD, JAMES WATSON (1867-). An American lawyer and diplomat (see Vol. IX). In 1917, on the declaration of war by the United States, he was recalled from his post of minister at Berlin and took up the practice of law in New York City. He published *My Four Years in Germany* (1917) and *Face to Face with Kaiserism* (1918).

GERMAN EAST AFRICA. The largest and most important former colonial possession of Germany. It had an area of 384,170 square miles and a population in 1913 of 7,659,898 natives and about 15,000 non-Europeans. Europeans, chiefly Germans, numbered 5336. Slavery had existed, but in 1914 the Reichstag moved for its abolition. The chief exports were rubber, copra, ivory, vegetable fibre, and coffee and by 1910 were valued at £1,040,269, and in 1913, £1,777,552. The chief imports were provisions, textiles, hardware, and iron and by 1910 were valued at £1,932,038, and in 1913, £2,667,925. More than half of the trade was with Germany and was carried almost completely in German bottoms. Trade passed through the ports of Dar-es-Salaam, Bagamoyo, Pangani, Kilwa, Lindi, Mikindani, and Tanga, and over the Usumbara Railway (219 miles) and the Tanganyika railway (787 miles). The last budget framed by the German government (1914) called for expenditures of £1,188,500 and revenues of £825,500. Up to 1917, the German administration continued unhampered and in spite of being cut off from foreign aid maintained its position with comfort until the British and Belgian advances finally compelled it to flee (November, 1917). (See WAR IN EU-

ROPE, *Colonies*.) Governments were set up by Belgium and Great Britain in the territories occupied by their troops, but in May, 1919, the whole of German East Africa was turned over to Great Britain as a mandate territory. By agreement with Belgium (September, 1919) the provinces of Urundi and Ruanda in the northwest were ceded under mandate to the Belgian Congo. In January, 1920, the territory was renamed Tanganyika Territory (q.v.).

GERMAN LITERATURE. German literature in the eventful decade 1914-21 offers valuable material to the student of national psychology. Love of the fatherland, right or wrong, had been so assiduously fostered in German homes and so methodically drilled into the people in barracks and universities, that it reached something like an ideal culmination a year before the outbreak of the War, when the centenary of the so-called Wars of Liberation was celebrated all over the country and commemorated in lyrics, drama, and fiction. It was but a short step from the prevalent sentiment and sentimentality of that year to the emotional frenzy of 1914. In some works which appeared during the first half of the year a trend of thought appears which in the light of the following summer could be called prophetic, did not documentary evidence prove that the people expected and approved the government's plan to expand and enrich the fatherland at the expense of its neighbors. Such a work was the drama *Kriegein Tedeum* by Carl Hauptmann, the brother of the more famous Gerhart. His poet's eye saw visions of what might be: in an indefinitely localized milieu a plot of diplomatic intrigue and domestic conflict, followed by mobilization, and ending in the horrible wreckage of war. Some works still echoed the festive patriotic notes of the centenary, as Walter Blöm's *Geschichte eines Jungen Freiheitshelden* and Franz Adam Beyerlein's *Das Jahr des Erwachens*. But with the declaration of war the glorious past gradually gave way to what was considered a glorious present. A flood of war poetry poured forth, some of it contained in the anthology *Der Heilige Krieg*, which among other violently patriotic outbursts gave wide circulation to Ernst Lissauer's "Hymn of Hate."

The spirit of the people was more or less truthfully reflected in the literature of this time of turmoil. But it should be remembered that a busy and rigid censorship promptly suppressed every voice of protest against the violation of international law and other iniquities of the government. Only very keen observers and students of German literature were aware of the existence of such a publication as *Forum*, founded by Wilhelm Herzog, to which the gifted Heinrich Mann contributed, but which was quickly confiscated. Fritz von Unruh's drama, *Das Geschlecht*, also disappeared from the boards. It is to be regretted that the works of Heinrich Mann, a far more original writer than his brother Thomas, and those of von Unruh, both men who have long ranked high in contemporary German letters, are unknown in America. The dramatic output of the year was unimportant. With the exception of the play by von Unruh, which profoundly stirred its audiences, and Paul Ernst's *Manfred und Beatrice*, which appeared in book form and was warmly received, no really noteworthy dramatic event was recorded. In fiction the vet-

eran Adam Müller Guttenbrunn revived memories of the German-Czech conflict in Bohemia in *Deutscher Kampf*. E. von Keyserling in *Abendliche Häuser* gave us a new story of the effete aristocracy, and Carl Hauptmann's *Schicksale* dealt with his favorite types of complex psychology. The most noteworthy poetical products rising above the voluminous war poetry were Stefan Georg's *Der Stern des Bundes* and Anton Wildgans's *Vae Victis*. Richard Meyer published his *Weltliteratur im Zwangstagen Jahrhundert*. Ricarda Huch's *Der Dreissigjährige Krieg* and Dr. Hermann Onckens's *Historisch-Politische Aufsätze* were the outstanding additions to history. Nietzsche was the subject of Otto Ernst's *Der Falsche Prophet*, Fritz Lienhard's *Parsifal und Zarathustra* and Elisabeth Förster-Nietzsche's tribute to her brother, *Der Einsame Nietzsche*.

The second year saw no decrease of literary activity. A pathetic example of the nationalistic frenzy which swept off their feet intellectuals, and so-called lower classes as well, was Carl Hauptmann, who in *Aus dem Grossen Kriege* had the bad taste to make the ruins of a Belgian cathedral the scene of one of these one-act plays. Emil Ludwig's *Kronprinz Friedrich* was a drama dealing with Frederick the Great's tragic youth. The most popular play was Schönherr's *Weibsteufel*, which subsequently found its way to America. In the unabated flood of war lyrics only the proletarian poet of Vienna, Alfons Petzold, sounded a broadly human note. But the year saw the debut of one who has since risen to the foremost rank, Franz Werfel, who published his *Einander*. Fiction was represented by Wolzogen, Bartsch, Geissler, Lucka, Felix Salten, and others, among them Carl Bleibtreu, who from his safe retreat in Switzerland sent out his *Bismarck*, with the bombastic subtitle, "A World-Novel." The most important purely literary work was Erwin Rohde's *Der Griechische Roman und Seine Vorläufer*. Valuable additions to biography were Ricarda Huch's *Wallenstein* and Wilhelm Bode's *Stunden mit Goethe*. Prompted by the spirit of the time, Thomas Mann wrote his *Friedrich und die Grosse Koalition*, Jacob Wassermann his *Deutsche Charaktere und Begebenheiten*, and Hans von Helmolt began his history, *Der Weltkrieg*. Houston Stewart Chamberlain and Hans von Wolzogen also took up their pens in defense of the Hohenzollern policy. A voice in this wilderness was that of Annette Kolb, a German-French writer, who in her essays *Wege und Umwege* arraigned the German press for sowing hatred among the nations. The anonymously published protest *J'accuse* was confiscated, and Hermann Fernau's *Gerade weil Ich ein Deutscher Bin* had a similar fate.

As the great slaughter continued in the following year with no end in sight, literary production in Germany showed a slight decrease. In drama, concessions to the spirit of the time could be seen in Sudermann's *Die Entgötterte Welt*, Schönherr's *Folk in Not*, and Wedekind's *Bismarck*. In fiction one novelist, Eduard Stillebauer, won the distinction of having his war story, *Inferno*, confiscated. Helene Böhlau wrote a charming story of the Goethe period, *Der Geourige Hund*, Gabriele Reuter *Das Neue Land*, Georg Hermann another story of old Berlin, *Heinrich Schöen, Jr.*, Gustav Meyrink *Der Golem*, which was later seen in America on the screen, and Max Brod a story of Kepler's time,

Tycho Brahes Weg zu Gott. The lyrical war madness continued, but in an anthology of that year, entitled *Vom Jungsten Tage* and containing contributions from the youngest generation, a new spirit struggled for expression, and a new personal note was struck by Franz Werfel. Critics and historians seemed to have lost some of the vaunted German *Sachlichkeit* and objectivity, for Dr. Ernst Elster's *Deutschum und Dichtung* and Dr. Rudolf Eucken's *Die Träger des Deutschen Idealismus* can hardly be ranked among valuable contributions to criticism. The most interesting work in that line was Dr. Heinrich Nohl's *Typische Kunststile in Dichtung und Musik*. Valuable for history of the drama were Ernst Posner's *Eystrebes und Erlebtes* and Dr. Heinrich Stümcke's *Vor der Rampe*. Noteworthy essays were Alexander von Gleichen Russwurm's *Der Narrenturm*, Heinrich Lhotzky's *Vom Heiligen Lachen*, and Emil Lucka's *Grenzen der Seele*. The aged Ernst Haeckel contributed to war literature *Weltkriegsgedanken über Leben und Tod*, and the erratic Polish author Stanislaus Przybyszewski, once identified with the Young Germany of the 1880's, showed his peculiar attitude in *Polen und der Heilige Krieg*.

Thus literature moved on until the year when America's entrance into the War was to turn the tide. The spirit of minority of German and Austrian authors manifested itself in the founding of *Neues Vaterland*, a publication which was to continue the policy of the suppressed *Forum*. Among its contributors were Dr. Rudolf Goldscheid; the Viennese economist, Walter Schücking, and Kurt Eisner; its pamphlets were widely circulated in Switzerland and wherever the German censor could not interfere. Dr. Alfred Fried, the pacifist, published his *Kampf um die Vermeidung des Weltkrieges* and Annette Kolb her *Briefe einer Deutschfranzösin*; Hermann Fernau continued his brave protest against modern German tendencies. The greatest dramatic success of the year, after the suppression of von Unruh's *Das Geschlecht*, was Stefan Zweig's *Jeremias*. Two younger playwrights, Walter Hasenclever and Georg Kaiser, came into prominence. The fiction output was meagre. But Karin Michaelis, the Danish-German writer, published a thrilling story of the wanderings of homeless Polish war victims, *Opfer*. The poets who had most vociferously joined in the war cry before seemed now to have lost their voice. Only Max Pulver's epic *Merlin*, Walter Hasenclever's *Tod und Auferstehung*, and Bruno Frank's *Requiem* deserve mention. Literature, criticism, and history fared no better. It is noteworthy that Wahle in the *Goethe Jahrbuch* called attention to Goethe's French sympathies. Ricarda Huch published a study of *Jeremias Gotthelf*, the village novelist. Dr. Adolf Stern's seventh volume of his *Geschichte Europas* appeared, covering the period from 1848 to 1870. Thomas Mann, true to his Prussian sympathies, wrote a new biography of Frederick the Great.

The year of the Armistice saw literary production at its lowest ebb, but it witnessed the publication of such works as Hermann Fernau's *Wie Deutsche Geschichtsschreiber einst Urteilen Werden*, Dr. Wilhelm Mühlton's *Die Verheerung Europas*, and Prof. G. F. Nicolai's *Biologie des Krieges*, which did much to open the eyes of thinking people. No great première was recorded on the German stage. The older gen-

eration was represented by Arthur Schnitzler's *Die Schwestern*, founded on an episode in the life of Casanova, and Carl Hauptmann's trilogy, *Die Goldenen Strassen*. Of the younger men, Georg Kaiser scored a success with *Von Morgen bis Mitternacht*, a play in the popular "kino" style, which was given by the Theatre Guild in New York: a performance of Paul Ernst's *Manfred und Beatrice* confirmed his claim to a place among leading German dramatists of the day. The outstanding works of fiction were Gerhart Hauptmann's *Merlin*, E. von Keyserling's volume of stories, *Im stillen Winkel*, and novels by the Swiss writers Ernst Zahn and J. C. Heer. Little poetry deserved mention except Wilhelm Schmidtbonn's *Der Wunderbaum* and Emanuel von Bodmann's *Schicksal und Seele*. A collection of the critical writings of Paul Schlenther was the most important publication of its kind. Among the biographies and memoirs were Dr. Karl Lamprecht's *Kindheitserinnerungen*; among the volumes of correspondence, La Mara's *Letters of Liszt*; and among historical works Dr. Alfred Friedjung's *Auf dem Wege zum Weltkrieg*. War literature, decreasing in volume, was represented only by Eberhard Bucher's *Kriegsdokumente*.

After the Armistice a change of spirit might have been expected. Those who held optimistic views on the subject were disappointed. Self-righteous pride in what Germany had shown the world, although it did not attain the goal of its ambition, became the keynote of an avalanche of war books. Count Czernin's *Im Weltkriege* opened the procession. But men like Walter Rathenau were beginning to be heard; his little books, *Nach der Flut*, *Der Kaiser*, and *Der Neue Staat*, reflected a saner spirit. Dr. Kurt Mühsam published a book with the significant title, *Wie Wir Belogen Wurden*. Otherwise the fall of the old régime failed to show any immediate effect. The most important dramatic event of the year was Richard Beer Hofmann's *Jakobs Traum*. Sudermann's *Das Höhere Leben* added one more to his many recent failures. Schönberr's *Königreich* appeared in a new revised and improved edition. Wedekind's *Felix und Galathea* and Elins *Erweckung*, and Stefan Zweig's *Legende des Lebens* made no deep impression. The fiction of the year showed the authors' sudden interest in their neighbors, as in Sudermann's *Luthauische Geschichten*. Lienhard's *Westmark*, Skowronnek's *Das Schleichende Gift*, Soyka's *Der Entfesselte Mensch*, and others. Schnitzler wrote another Casanova story, *Casanoras Heimfahrt*; Frenssen wrote *Die Brüder*; Gabriele Reuter, *Die Jugend einer Idealistin*; and Heinrich Mann, *Professor Urat*. Noteworthy poetical productions were Christian Morgenstern's *Stufen*, Schaukal's *Tersen*, Lissauer's *Die Ewigen Pfingsten*, and Walter Heymann's posthumous, *Fahrt und Flug*. A work showing the German love of research was Max Scherrer's *Kampf und Krieg im Deutschen Drama von Gottsched bis Kleist*. War memories were perpetuated in Richard Dehmel's *Kriegstagebuch* and Georg Herrmann's *Randbemerkungen, 1914-17*. The last work of the beloved Austrian, Peter Altenberg, bore the title *Mein Lebensabend*. A history of the Russian Revolution was published by that keen observer, Alfons Paquet. Grete Meisel-Hess concluded her thoroughgoing studies of the sex problem in a two-volume work, *Das Wesen der Geschlechtlichkeit*.

The year 1920 brought more explanations. Hans von Helmolt brought out *Ein Vierteljahrhundert Weltgeschichte, 1894-1919*, and when the socialist Karl Kautsky gained access to the government archives and published some incriminating documents relating to the War, he attempted to discredit the evidence in *Kautsky der Historiker*. Literary production assumed almost pre-war proportions, but a change of spirit had not taken place. Works voicing disapproval of the course pursued in the past or striking a note different from the prevalent self-righteous patriotism, were still rare exceptions. Among the few such can be noted Bernhard Kellermann's story of Armistice Day, *Der Neunte November*, and the gruesome picture of ruin and wreckage in Bolshevik Russia, *Ararat*, by Arnold Ullitz. Heinrich Mann's *Der Ehrgeizige* can be classed with this minority. The remaining works of fiction deserving of notice are Carl Hauptmann's *Der Volder und die Lilienweisse Stute*; Bruno Wille's *Glasberg*, a story of his youth; Johannes Schlaf's *Miele*, Jakob Wassermann's *Der Wendepunkt*, and Clara Viebig's *Das Rote Meer*. In drama Fritz von Unruh created a sensation with the second work of his trilogy *Platz*, and Heinrich Mann with *Der Weg zur Macht*. The new plays by Gerhart Hauptmann, *Der Weisse Heiland* and *Hirtenslied* which was written long ago, hardly added to his fame. Carl Hauptmann's love of far-fetched titles was evident in his new work *Gaukler, Tod und Juwelier*.

In the poetry of the year Franz Werfel appeared with *Der Gerichtshof*, and an almost forgotten poet of the previous generation, Hugo Salus, with *Das Neue Buch*. Julius Bab compiled two anthologies *Die Deutsche Revolutionslyrik* and *Der Deutsche Krieg im Gedicht*. Literature and criticism were represented by Emil Ludwig's volume on *Goethe*, Etta Federn's *Hebbel*, and Dr. Heinrich Maync's *Fontane*. Among biographies and memoirs, the most important was Hermann Oncken's *Ferdinand Lassalle*. Gustav Frenssen's *Grubeleien* belongs to books of personal reflections and impressions. Collections of folktales of South American Indians, the Caucasus, Russia, and other countries, were numerous during this year, and a few books of travel also rose to literary importance, among them Bernhard Kellermann's *Ein Spaziergang in Japan* and Stefan Zweig's *Fahrten, Landschaften, und Städte*. Books of a certain ethical import were Hermann Hesse's *Zarathustras Wiederkehr, ein Wort an die Deutsche Jugend* and Wilhelm Uhde's singularly interesting work, *Die Freude*, containing lessons for a new reading of life in quotations from Schiller to Paul Claudel and illustrations from Beltraccio to Picasso. Jakob Schaffner's *Erlösung vom Klassenkampf* gives voice to the old socialist creed. Fritz Mauthner's *Der Atheismus und Seine Geschichte im Abendlande* is an erudite work but hardly of wide appeal.

The literature of the last three years of this decade returned to pre-war quantity and quality. The writers who had learned a lesson from the terrible calamity brought on the world by the lust for power were still few in number, and their voices were little heeded. No new note was struck in fiction. As the group once identified with what was known as the literary revolution of the 1880's reached middle age, their work differs little in spirit and form from the literature of the older generation which

they were fighting 40 years ago. One of the surviving veterans of that older generation, Adam Müller-Guttenbrunn, has written a story about Lenau, *Dämonische Jahre*. But of that Young Germany of the 1880's, only a few are producing works of striking individuality. The latest products of that group are Carl Hauptmann's *Drei Frauen*, Bruno Wille's *Holderlin und Seine Heimliche Maid*, Jakob Wassermann's *Der Wendekreis*, and Johannes Schlaf's *Wandlungen*. Gustav Meyrink's new mystery story, *Der Weisses Domikaner*, bids fair to rival *Der Golem*. Idolde Kurz has published a new volume of short stories, *Legenden*. Franz Werfel entered the field of fiction with *Der Spielhof*.

The poetical output of these three years was negligible in quality, even if such names appeared on the record as Arno Holz, the author of *Die Bleichschmiede*, Gerhart Hauptmann with his epic *Inna*, and Cäsar Flaischlen with a volume called *In Schloss der Zeit*. Only Stefan George's *Drei Gesänge* maintains the high standard of his somewhat precious style. Essays and criticism began to flourish as before. A history of Polish literature by A. Brückner deserves mention. Goethe and Shakespeare were continually made subjects of research and comment. Eichendorf, Keller, Lenau, and others were also much interpreted. Interesting memoirs came from Carl Ludwig Schleich, Rudolf Eucken, and Gabriele Reuter. A work which attracted special attention was a posthumous volume, *Aus den Nachgelassenen Schriften eines Frühvollendeten*, by Otto Braun, who fell early in the War and is looked on as something of a literary prodigy by German critics. Eduard Fuchs has added to his books on caricature *Die Juden in der Karrikatur*. Among the many volumes on contemporary history, both the ex-Kaiser's *Gestalten und Ereignisse* and the ex-Crown Prince's *Erinnerungen* received more publicity than they merited. The same can be said of the explanatory volumes by von Tirpitz, von Ludendorff, von Moltke, and others, which were supplemented by innumerable booklets and pamphlets of a more or less incendiary and provocative character, describing the future destruction of France, the next war, etc. To this category belongs also the booklet by Hermann Scheffauer, a German-American who took up his residence in Berlin during the War and wrote *Blood Money: Woodrow Wilson and the Nobel Prize*.

In drama alone, German literature of the last three years of the decade shows some signs of a revival. The older generation had no share in it. Gerhart Hauptmann treats an Aztec subject in his *Indiohdi*; in his *Peter Brauer* he returns to his former manner. Schönherr, becoming almost too prolific, followed his gruesome *Kindertragödie*, which scored a deserved failure in New York, with two plays in lighter vein, *Vivat Academie* and *Maenianz*. Wedekind's posthumous *Die Junge Welt* and Fulda's *Des Esels Schatten* failed to make any profound impression. Anton Wildgans began a trilogy in his *Cain*, to be followed by *Moses* and *Christus*. Trilogies being in order, Sudermann, too, was presenting one under the title of *Das Deutsche Schicksal*. But not one of these writers seems to have been deeply enough stirred by the great cataclysm to have conceived new ideas about the world and mankind or to have seen the problems of life in a new light. This was reserved for three men who only during these turbulent years came to the fore: Fritz

von Unruh, Franz Werfel, and Ernst Toller. Of the older generation, only the Austrian Karl Kraus, who spent his life in fighting the corruption of the Viennese press, dared to expose the dastardly policies of the Central Empires in a tragedy called *Die Letzten Tage der Menschheit*.

Fritz von Unruh had made his debut about 1910 with a play called *Offiziere*, which was followed by *Prinz Louis Ferdinand*, and the novel *Opfergang*. *Stürme*, a play of his youth, was rewritten. Then followed his trilogy consisting of *Das Geschlecht*, *Platz*, and *Dietrich*, the prologue of which, *Rosengarten*, is a most remarkable piece of writing and proved dramatically effective. The works of von Unruh, with their philosophical outlook and broadly human sympathies, found warm admirers among French critics. Franz Werfel, too, proved at the very outset of the War that his vision was not to be dimmed. His early verse and fiction were overshadowed by the originality and power of his dramas, *Spiegelmensch* and *Bocksgesang*. The latest of these remarkable newcomers is Ernst Toller, a young idealist whose participation in the communist uprising in Munich sent him to prison. He at first saw man collectively, as in that stupendous drama *Masse Mensch*, and also in the *Maschinenstürmer*. His next work was *Der Entfesselte Wotan*, but his latest, *Hinkemann*, proves that he does not lack the gift to limn an individual's tragic fate. The plays of these three men, as also the latest lyrical product of Franz Werfel, *Schwalbenbuch*, make them the protagonists of a new spirit in Germany.

GERMAN NEW GUINEA. A former territory of the German Empire in the western Pacific. It fell to Australian troops on Sept. 12, 1914. The Treaty of Versailles partitioned the islands of the territory as follows: those north of the equator, the Caroline, Marshall, Pelew, and Ladrone Islands, with the exception of Guam, to Japan under mandate; those south of the equator, the Bismarck Archipelago, the German Solomon Islands, and Kaiser Wilhelmsland (on New Guinea) to Australia; and German Samoa to New Zealand. See PACIFIC OCEAN ISLANDS and NEW GUINEA.

GERMAN REFORMED CHURCH. See PRESBYTERIAN CHURCHES.

GERMAN SOUTHWEST AFRICA. Formerly the oldest German colony in Africa, but since 1920 a British mandate territory, administered under the name of the Southwest Africa Protectorate, by the Union of South Africa. It had an area of 322,400 square miles, and in 1913, a native population of about 200,000. Whites, mostly Germans, numbered 14,816. The colony was of particular value to Germany because of the ease with which white colonists could be acclimated. Cattle raising, gold, diamond, and copper mining were the leading activities; the exports in 1912 were valued at \$7,734,762. The imports, made up of foodstuffs, iron and iron products, textiles, etc., were worth \$9,290,330. Trade was exclusively with Germany, the port of Swakopmund being its chief centre. Internal routes of communication were over the Otavi Railway (417 miles), Swakopmund-Windhoek Railway (237 miles), Northern Railway (314 miles), and Southern Railway (339 miles). For administrative purposes, the budget of 1913 balanced at \$7,804,258, of which a little less than half, or \$3,481,-

226, had to be furnished as an imperial subvention. Under General Botha, leader of the Union of South Africa forces, the German administration was compelled to flee the country, so that by July, 1915, the British occupation was complete. Germany renounced her sovereignty in the Treaty of Versailles with the result that in May, 1919, the Supreme Council assigned the territory under a mandate to the Union. On Dec. 17, 1920, the League Council approved the transfer. See *WAR IN EUROPE, Colonies*, and *SOUTHWEST AFRICA PROTECTORATE*.

GERMAN WEST HUNGARY. See *BURCELAND*.

GERMANY. A federal republic organized under the constitution of Aug. 11, 1919, embracing territory in Central Europe between France, Belgium, and Holland on the west, and Poland on the east. The Treaty of Versailles redefined Germany's territorial limits and assigned the provinces of Alsace and Lorraine (q.v.) to France, a small district comprising the towns of Eupen and Malmédy (q.v.) to Belgium, North Schleswig (q.v.) to Denmark, and a large block of territory to Poland (q.v.), including parts of East and West Prussia which were made into the Danzig corridor (q.v.), and some parts of the territory of Upper Silesia (q.v.), which were ceded to Poland in accordance with the decisions of a committee appointed by the League of Nations after a plebiscite held in the district in 1922. The Saar Basin (q.v.) was handed over to the administration of a commission appointed by the League of Nations, and a plebiscite to be held at the end of 15 years was provided for to decide the sovereignty of the territory. According to the figures of the census of 1910, the area and population of Germany were:

	Area in sq. km.	Number of inhabitants	Inhabi- tants per sq. km.
German pre-war area	542,622	64,925,993	120
Ceded territory	70,588	6,476,200	92

The estimated total of the population of Germany on July 1, 1914, was 67,790,000. The census of Oct. 8, 1919, on the basis of territory as of Jan. 1, 1923, showed:

	Area in sq. km.	Number of inhabitants	Inhabi- tants per sq. km.
German present area	472,034	59,852,682	127
Occupied territories only	36,674	10,710,166	292

The estimated total of the population of Germany on Jan. 1, 1923, was 62,281,000

Overseas emigration from Germany via German and foreign ports was as follows: 1913. 25,843; 1920, 8548; 1921. 23,451; 1922, 36,527; 1923 (11 months only), 101,320. In pre-war years the rapid industrial expansion tended to prevent the large emigration which had characterized the early part of the nineteenth century. Figures for the year 1923 would seem to indicate a revival of emigration from Germany. This was of particular significance as an indication of living conditions within the country. According to the occupation census of 1907, the total number of wage earners was 30,232,000, of whom 27,274,000 were in the post-war territory. This included all persons engaged in any kind of occupation and those liv-

ing on their own means, such as pensioners, pupils, institutional inmates, etc. The number of workers in agriculture and forestry for the post-war territory of Germany was 8,554,000; in mining and industry, 10,451,000; in trade and transportation, 3,220,000; in personal services, 431,000; in government employ, 1,511,000. The number of workers of 1924 in agriculture and forestry was about identical with that of 1907; that in mining and industry increased by about 20 per cent, and in trade and transportation by 20 per cent. A decrease took place in the number of government employees through the abolition of compulsory military service, thus decreasing the army from 800,000 to 100,000 men. The total number of persons occupied in Germany was, in 1924, about 33,000,000, of whom 16,000,000 were workmen.

Agriculture. The total area in 1914 was 54,109,836 hectares. The area of the ceded territories amounted to 7,021,287 hectares, leaving a post-war area of 47,088,549. The 1924 area, inclusive of the Saar Basin, was divided as follows: arable soil, 21,589,043 hectares; horticultural land, 478,586; grass land, 5,358,734; pasture, 2,288,984; fruit orchards, 48,885; vineyards, 70,187. The entire arable land available for agricultural purposes was thus 29,854,419 hectares. Forests amounted to 12,699,875 hectares, and barren area used neither for agriculture nor forestry, to 4,534,255 hectares. The following indicates crops before and after the War (area of cultivated soil in hectares):

Crop	1923 Area in	1923 Area in	Per cent Increase or Decrease
Wheat	1,974,098	1,478,417	-11.8
Spelt	272,493	128,471	-52.8
Rye	6,414,143	4,366,481	-17.0
Spring barley	1,654,020	1,198,850	-13.6
Oats	4,438,209	3,344,705	-14.8
Potatoes	3,412,201	2,726,859	-2.7
Sugar beets	569,082	383,557	-17.8
Fodder beets		756,559	
Fodder grass	8,162,055	7,673,467	-6.7

Crops in Tons			
Wheat	4,655,956	2,896,814	-28.4
Spelt	438,469	159,270	-63.6
Rye	12,222,394	6,681,622	-34.1
Total bread grains	17,316,819	9,737,706	-33.4
Spring barley	3,673,254	2,126,846	-30.0
Oats	9,713,965	6,106,776	-29.1
Potatoes	54,121,146	32,580,553	-26.0
Sugar beets	16,918,782	8,695,722	-27.8
Fodder beets		21,964,014	
Hay	42,029,032	34,517,991	-6.4

Crops in Tons per Hectare			
Autumn wheat	2.35	1.97	-18.3
Spring wheat	2.39	1.90	-20.8
Spelt	1.61	1.24	-23.0
Autumn rye	1.92	1.54	-20.6
Spring rye	1.84	1.18	-12.6
Spring barley	2.22	1.78	-19.1
Oats	2.19	1.83	-16.8
Potatoes	15.86	11.95	-23.9
Sugar beets	29.73	22.67	-24.4
Hay	5.15	4.50	-12.3

The following indicates live stock before and after the War:

Animals	Dec. 1, 1913	Oct. 1, 1923	
Horses	4,558,329	3,650,808	(Dec. 1, 1922)
Cattle	20,994,344	16,652,831	
Swine	25,659,140	17,225,855	
Sheep	5,520,737	6,094,022	
Goats	3,548,484	4,658,607	
Poultry	82,163,922	65,204,617	(Dec. 1, 1922)

The increase in number of sheep and goats reflected the lowered production of grains for animal feeding and more especially the decline in imported animal foodstuffs, such as cottonseed meal. Sheep and goats require a minimum of imported animal foodstuffs. The number of live stock slaughtered showed a considerable decrease in 1923 as compared with pre-war figures. Oxen were slaughtered to the number of 364,026 in 1913 and 155,784 in 1923, a decrease of 57.2 per cent; bulls, 359,878 in 1913 and 184,500 in 1923, a decrease of 48.7 per cent; cows, 1,095,160 in 1913 and 774,304 in 1923, a decrease of 29.3 per cent; bullocks and heifers, 580,419 in 1913 and 472,185 in 1923, a decrease of 18.6 per cent; calves, 2,872,412 in 1913 and 2,133,342 in 1923, a decrease of 25.7 per cent; swine, 11,769,889 in 1913 and 4,028,534 in 1923, a decrease of 65.8 per cent; sheep, 1,489,706 in 1913 and 799,962 in 1923, a decrease of 46.3 per cent; goats, 318,014 in 1913 and 135,050 in 1923, a decrease of 57.5 per cent; horses, 106,342 in 1913 and 119,128 in 1923, an increase of 12 per cent. It was significant that the only increase in slaughterings took place in the case of horses, showing the tendency of the population to turn toward cheaper meat products. The following indicates the consumption of meat in Germany before and after the War, in hundreds of kilograms, calculated on the basis of inspected slaughterings:

Description	1913	1922
Home grown meat . . .	26,547,129	14,464,510
Imports of meat, meat products and fat . . .	2,379,559	1,939,156
Exports of meat, meat products and fat . . .	27,174	24,347
Available quantity of meat for home consumption . . .	28,899,214	16,379,319
Per head of population . . .	43 15	26 71
Decrease of consumption of meat per head of population		16 44 or 38 1%

Food Consumption. The average annual consumption in 1913 and 1914 of rye per capita was 153.1 kilograms. In 1922 and 1923, this had fallen to 91.9 kilograms. Similarly, the consumption of wheat and spelt together fell from 95.8 kilograms to 47.6 kilograms; barley from 108 kilograms to 30 kilograms; oats from 128.3 kilograms to 58.5 kilograms; potatoes from 700.2 kilograms to 573.2 kilograms. The very large consumption of potatoes in Germany was a feature of German domestic economy. Germany remained still the largest producer and consumer of potatoes, since these were utilized not only for human food but also for animal food and the production of alcohol, starch, potato flour, etc. The consumption of sugar in Germany in 1913 amounted to 1,282,309 tons or 19.2 kilograms per person; in 1922 this had risen to 1,289,107 tons or 20.7 kilograms per person, an increase of 7.7 per cent. The rice which was consumed in 1913 amounted to 167,190 tons or 2.49 kilograms per person; in 1922 the consumption was 100,654 tons or 1.64 kilograms per person, a decrease of 34.1 per cent. Herrings were consumed to the extent of 1,294,142 barrels in 1913 or 2.89 kilograms per head. In 1922 the figures are 705,268 barrels or 1.73 kilograms per head, a decrease of 40.1 per cent. The next table indicates imports of food and live stock in 1913 and 1922.

Unemployment. The number of unemployed and part-time workers drawing government ben-

Articles	1913	1922
Grain and Fodder (in hundred kilograms)		
Rye	3,525,418	5,395,928
Wheat	25,459,586	13,925,752
Barley	32,882,117	2,670,164
Oats	5,050,223	905,664
Corn	9,186,450	10,854,161
Fodder	1,890,543	358,624
Live stock (number)		
Horses	143,586	44,216
Cattle	260,752	61,802
Sheep	28,465	1,328
Goats	458	100
Swine	148,422	101,544

efits in the unoccupied territory of Germany were as follows on Dec. 1, 1923: Chief recipients, 1,465,670; additional recipients, 1,436,003; short-time workers, 1,795,161. Unemployment amounted to a total of 28.2 per cent of all workers in December, 1923. In the metal industries alone the figure was 28.3 per cent and in the textile industry, 11.9 per cent.

Industry. The German output of coal amounted to 190,109,000 metric tons in 1913 and 129,965,000 metric tons in 1922 for the same area as was given in pre-war years. The actual production of coal in the present area of Germany under the Treaty of Versailles in 1922 was 119,145,000 metric tons. Production of lignite in Germany in 1913 was 87,233,000 and in 1922, 137,073,000. Production of coke was 34,630,000 in 1913 and 29,113,000 in 1922. In 1922 Germany delivered 18,953,844 tons of coal and coke calculated in terms of pit coal as reparation deliveries to the Allies. This was divided as follows: to France, coal, 4,486,250 tons; coke, 5,585,117 tons; lignite briquettes, 516,965 tons; to Belgium, coal, 2,312,029 tons; coke, 460,772 tons; lignite briquettes, 86,961; to Luxemburg, coal, 12,224 tons; coke, 371,847 tons; lignite briquettes, 60,688 tons; to Italy, coal, 2,606,291 tons; coke, 93,794 tons. The production of sulphuric acid in Germany was 1,727,381 tons in 1913 and 849,652 tons in 1921. Production of iron ore was 28,607,903 tons in 1913 and 5,980,142 in 1922. The production of lead and zinc ores was 2,888,758 tons in 1913 and 1,192,847 tons in 1922. The production of rock salt and evaporation salts was 2,025,484 metric tons in 1913 and 3,069,019 tons in 1922. Potash salts produced in 1913 totaled 11,956,528 metric tons and in 1922 had increased to 13,076,173 metric tons. In 1913 Germany produced 16,764,000 metric tons of pig iron. In 1920 this had fallen to 6,004,000 tons. Germany produced 16,943,000 tons of steel ingots in 1913 and 7,396,000 metric tons in 1920. Rolling mill products amounted to 13,119,000 tons in 1913 and 5,656,000 in 1920. Cast iron, including steel ingots, amounted to 3,549,000 tons in 1913 and 2,131,000 tons in 1921. There were 23,292 breweries in 1913 producing 69,200,000 hectolitres of beer, or 103 litres per head of the population. In 1922, 7363 breweries produced 31,235,000 hectolitres, or 50 litres per capita. In 1913, 133 factories produced 1,083,000 bottles of fruit wine. In 1921, 105 factories produced 1,260,000 bottles of fruit wine. In 1913, 157 factories produced 11,808,000 bottles of sparkling grape wine; in 1921, 113 factories produced 12,662,000 bottles of sparkling grape wine. For the production of spirits, distilleries numbered 62,887 in 1913 and 44,047 in 1922. These distilleries produced 3,753,000 hectolitres in 1913, or 5.4 litres per capita. In 1922, production amounted to 1,271,000 hecto-

litres, or 2 litres per head of population. There were 378 factories in 1913, producing 2,716,000 tons of sugar; in 1923, 292 factories produced 1,456,000 tons. Cigarettes numbering 12,412,000,000 were produced in 1913 and 19,769,000,000 in 1920. The 70 match factories of 1913 produced 90,586,000,000 matches; in 1921, 66 factories produced 106,562,000,000 matches. A total of 175 factories produced 13,700,000 carbon filament lamps in 1913 as compared with 128 factories with a production of 7,200,000 in 1921. Metal filament lamps were produced amounting to 93,000,000 in 1913, and 102,000,000 in 1921. Incandescent gas mantles amounted to 134,000,000 in 1913 and 54,000,000 in 1921.

The table reveals the number of German joint stock companies and limited liability companies in 1913 and 1923.

The capital required by German companies and corporations before the War averaged 102,570,000 gold marks per month in 1913. In 1921, the monthly average was 124,230,000 gold marks.

Communications. In 1913 the German state railways comprised 58,872 kilometers of line with 27,690 engines, 61,276 passenger cars, and 631,323 freight cars. In 1921 the length of lines was 52,377 kilometers; engines numbered 31,070, passenger cars 66,736, and freight cars 668,349. The railways conveyed 1,685,900,000 passengers in 1913 and 2,318,500,000 passengers in 1921; they carried 478,000,000 metric tons of goods in 1913 and 371,400,000 metric tons in 1921. The number of passenger kilometers in

1913 and a net deficit of 6,892,000,000 paper marks in 1921.

The freight traffic on German railways and inland waterways before and after the War was as follows:

RAILROADS			
Description of goods	1913	1921	Per cent increase or decrease
(in thousands of metric tons)			
Total	501,118	354,607	- 29.2
Pit coal briquettes and coke	160,564	104,219	- 35.1

1913 was 39,024,000,000 and 49,193,000,000 in 1921. The number of ton kilometers was 57,900,000 in 1913 and 55,668,000 in 1921. The revenue and expenditure of the German state railways was as follows:

Passenger revenue in 1913	964,000,000 gold marks
" " 1921	7,244,000,000 paper marks
Freight revenue in 1913	2,140,000,000 gold marks
" " 1921	33,700,000,000 paper marks
Total revenue in 1913	3,343,000,000 gold marks
" " 1921	45,132,000,000 paper marks

The expenditure was 2,844,000,000 gold marks in 1913 and 52,024,000,000 paper marks in 1921, leaving a net surplus of 504,000,000 in

The German mercantile marine, including steam and motor vessels, amounted in 1914 to 2090 ships with 5,134,720 registered gross tons. In 1923, the number of steam and motor vessels was 1745, amounting to 2,509,768 registered gross tons, a decrease of 51.1 per cent. In 1913, 1,181,000 ships were in course of construction in German shipyards for German account. These amounted to 1,460,041 tons. For foreign account there were 257 vessels under construction, amounting to 69,926 tons. In 1922, there were under construction for German account, 1253 vessels with a registered gross tonnage of 1,393,225, and 100 vessels with a registered gross tonnage of 102,470 for foreign account.

The number of seagoing vessels entering German ports in 1913 under all flags was 115,966, of which 26,637 were under foreign flags. The total tonnage was 34,772,177, of which that under foreign flags amounted to 13,540,935. Vessels clearing amounted to 117,375, of which 26,919 were under foreign flags. The tonnage was 34,921,806, of which foreign flags accounted for 13,645,219. In 1922, vessels entering German ports numbered 59,427, of which foreign flags amounted to 12,954. Tonnage was 26,487,601, of which 16,208,403 were under foreign flags. Vessels clearing in 1922 were 61,311, of which foreign flags were 13,100. Tonnage was 26,349,792, of which foreign flags amounted to 16,260,488.

Commerce. The following gives German exports and imports for 1913 and 1922 by principal classes (value in millions of gold marks):

	1913	1922
IMPORTS		
Animals living	289 7	81 6
Food and drink	2,796 5	1,292 9
Raw materials	4,997 1	2,829 2
Articles partly manufactured	1,263 3	986 4
Articles wholly or mainly manufactured	1,422 1	1,112 7
Gold and silver	437 4	8 7
Total	11,206 1	6,311 5
EXPORTS		
Animals living	7 4	12 3
Food and drink	1,068 7	201 1
Raw materials	1,300 7	363 7
Articles partly manufactured	939 8	498 8
Articles wholly or mainly manufactured	6,778 3	5,104 7
Gold and silver	103 7	18 8
Total	10,198 6	6,199 4

A comparison of leading German imports of goods in 1913 and 1922 follows:

	1913	1922	Per cent increase or decrease
(in thousands of metric tons)			
Coal	10,540 1	12,598 4	+ 19 5
Coke	594 5	288 8	- 51 4
Lignite	6,987 1	2,015 7	+ 71 2
Iron ore	14,024 3	11,013 7	- 21 5
Iron balls and ingots	11 0	325 2	+ 2,856 4
Pig iron	124 3	294 3	+ 136 7
Rails	2 4	146 7	+ 36,575
Salt	21 4	2	- 99 0
Chile saltpetre	774 3	31 5	- 95 9
Artificial fertilizer	562 1	344 8	- 38 7
Cotton	477 9	252 3	- 47 2
Cotton goods	42 6	83 1	+ 95 0
Rye	352 5	539 6	+ 53 1
Wheat	2,546 0	1,392 6	- 45 3
Barley	3,238 2	267 0	- 91 8
Oats	505 0	90 6	- 82 1
Potatoes	382 1	167 6	- 56 1
Beet sugar	1	111 9	+ 111,800 0
Coffee	168 3	36 8	- 78 1
Fresh herring	129 8	45 5	- 64 9
Salted herring in barrels	1,298 1	931	- 28 3

A similar comparison of German exports for 1913 and 1922 shows a decrease in all items with the exception of salt and salted herrings.

Currency and Credit. The circulation of paper money in 1913 amounted to 2,100,000,000 paper marks in Reichbank notes, 110,000,000 in currency notes, and 140,000,000 in private bank notes, a total of 2,400,000,000 marks. Specie in circulation totaled 3,700,000,000 marks; a grand total of specie and paper money of 6,100,000,000 marks was in circulation. In 1923 the number of Reichbank notes in circulation was 74,941,738,917,400,000 000. Private bank notes in circulation were 13,063,445,500,000 marks, making a total of paper money in circulation

	1913	1922	Per cent increase or decrease
(in thousands of metric tons)			
Coal	34,598 4	5,062	- 85 4
Coke	6,433	908 2	- 85 9
Iron ore	2,613 2	178 1	- 93 4
Pig iron	782 9	157 8	- 79 8
Iron balls and ingots	700 8	102 1	- 85 4
Iron girders	446 9	38 8	- 91 3
Iron bars and shaped iron	1,173 3	473 5	- 59 6
Rails	500 8	286 1	- 42 9
Salt	432 1	968 5	+ 123
Sulphate of potash	133 4	85 2	- 36 1
Potash and other mine salts	1,676 2	913 1	- 45 5
Artificial fertilizers	1,029 4	19 4	- 98 1
Aniline and aniline dyes	71 6	39 2	- 45 3
Woolen goods	74 4	33 9	- 54 4
Cotton goods	85 8	35 6	- 58 5
Rye	934 5	2	- 99 8
Wheat	328 3	4 3	- 99 2
Oats	661 7	5 6	- 99 2
Potatoes	332 5	67 2	- 79 8
Beet sugar	110 1	12 5	- 98 9
Fresh herrings	10 8	8	- 92 6
Salted herrings in barrels	5 5	234 5	+ 4,163 6

at the end of December, 1923, of 74,954,802,394,900,000,000 marks. The value of this currency in gold marks was calculated as 722,000,000 on Dec. 31, 1922, figure one gold mark as equal to 1,000,000,000 paper marks. Average monthly clearings of the Reichbank in 1913 were 6,100,000,000 marks. In December, 1923, there were 197,553,153,600,000,000 marks; expressed in gold marks, 1,109,800,000. The circulation of stable currency in Germany on Dec. 31, 1923, expressed in gold marks, was 1,049,100,000 Rentenmarks, 240,000,000 gold loan notes, 141,900,000 emergency railway notes, and 234,700,000 gold loan emergency currency, or a total of 1,665,700,000 stable value currency. The average amount of Treasury bills held by the public in 1922 was 135,400,000,000 paper marks. Private deposits with the Reichbank average 80,700,000,000. The depreciation of the German paper mark was accompanied by a rise in domestic prices; on Jan. 2, 1924, foodstuffs were 1088 times their pre-war price. Industrial goods had increased 1479.1 times in price; domestic goods, 1153.2 times; imported goods, 1579.6 times; the average for all classes of goods was 1224.3 times. The gold mark value on the same classes of goods on Jan. 2, 1924, was as follows: foodstuffs had increased 88 per cent above the 1913 level; industrial goods, 47.9 per cent; domestic goods, 15.3 per cent; and imported goods, 58 per cent, giving a general average of price increases for all classes of goods of 22.4 per cent over 1913. Retail prices of certain goods in Berlin showed considerable changes from 1913 to 1923. One kilogram of rice worth 26 pfennigs in 1913 was worth 35 64 pfennigs in December, 1923; the percentage of increase was 36.9. A kilogram of yellow peas increased from 40 pfennigs to 96 pfennigs, or 140 per cent; a kilogram of potatoes from 5 pfennigs to 7.6, or 52 per cent; a kilogram of stewing beef from 183 pfennigs to 260, or 44.4 per cent; a kilogram of pork from 160 pfennigs to 320, or 100 per cent; a kilogram of butter from 280 pfennigs to 520, or 85.7 per cent; a kilogram of margarine remained stationary at 140 pfennigs; a kilogram of imported lard increased from 140 pfennigs to 168, or 20 per cent; a kilogram of sugar from 50 pfennigs to 90, or 80 per cent; an egg from 9 pfennigs to 21, or 133.3 per cent; a litre of milk from 22 pfennigs to 32, or 45.5 per cent.

Wages. The weekly wages of skilled labor showed the following changes from 1913 to December, 1923: all workmen, 35 02 marks to 16,542,000,000,000 in November, 1923; miners, from 37 562 to 18,582,000,000,000 in 1923; metal workers from 36.2 to 29,882,000,000,000, factory hands, from 32 99 to 29 040,000,000,000; typesetters from 32.84 to 23 80 gold marks; workmen in government employ, from 34.56 to 24 gold marks. Unskilled labor showed the changes from 24.31 to 14,231,000,000,000 in November, 1923; miners, from 24 84 to 15,492,000,000,000 in November, 1923; metal workers, from 24 44 to 25,245,000,000,000; factory hands, from 26 76 to 26,590,000,000,000; typesetters, from 23 67 to 21 34 gold marks; workmen in government employ, from 23.7 to 18.72 gold marks. The nominal and real weekly wages of skilled and unskilled laborers in Berlin from 1913 to 1923 changed, in the building trades, from 43.46 marks in 1913 to 33.27 gold marks in December, 1923, which had the pre-war purchasing power of 29.11 marks. An unskilled laborer received 29.15 marks in 1913, and 29.61 gold marks in 1923, with a purchasing power of 25.91 in pre-war currency. Skilled woodworkers received 34 gold marks in 1913 and 32 89 gold marks in 1923, with a purchasing power of 28.78 in pre-war currency. Unskilled woodworkers received 24.64 marks in 1913 and 24.84 marks in 1923, with a purchasing power of 21.73 marks in pre-war currency. Skilled metal workers received 42.44 marks in 1913 and 31.44 marks in 1923, with a purchasing power of 27.47 in pre-war currency. Unskilled metal workers received 30.62 in 1913 and 23.52 gold marks in 1923, with a purchasing power of 20.53 in pre-war currency. Skilled factory hands received 36.18 marks in 1913 and 24.96 marks in 1923, or 21.84 in pre-war currency. Unskilled factory hands in the chemical industry received 25.47 marks in 1913 and 22.8 marks in 1923 with a purchasing power of 19.95 marks in pre-war currency. Skilled typesetters received 34.38 marks in 1913 and 27 gold marks in 1923, with a purchasing power of 23.57 in pre-war currency. Unskilled typesetters received 27.03 marks in 1913 and 22.95 marks in 1923, with a purchasing power of 24.04 marks in pre-war currency. Unskilled workmen received in government employ 34.56 marks in 1913 and 25.57 marks in 1923, with a purchasing power of 22.37 marks in pre-war currency. Unskilled workmen received 23 07 marks in 1913 and 19.87 gold marks in 1923, with a purchasing power of 17.38 marks in pre-war currency.

Finance. The government's funded debt in 1913 amounted to 4,555,800,000 marks. There were, besides, 220,000,000 marks in treasury bills, making a total of 4,805,800,000 marks. In 1923 the funded debt amounted to 50,126,000,000; the premium loan amounted to 3,850,000,000; interest-bearing treasury bills amounted to 6,482,000,000. This gave a total funded debt of 60,488,000,000 with gold mark value of \$2000. The floating debt (discount treasury bills) arose to 96,874,330,250,000,000 in November, 1923. This amount was all held by the Reichbank.

For debts of the German states see table in next column.

The revenues and expenditures of the government for the fiscal year 1922, calculated on a dollar index, were as follows: revenues from

Prussia	3,400,000,000
Bavaria	213,200,000
Saxony	622,400,000
Württemberg	829,000,000
Baden	
Thuringia	218,000,000
Hesse	16,000,000
Hamburg	3,039,200,000
Mecklenburg Schwerin	107,300,000
Oldenburg	186,500,000
Brunswick	30,400,000
Anhalt	65,000
Bremen	945,000,000
Lippe	5,200,000
Lubeck	190,600,000
Mecklenburg Strelitz	2,700,000
Waldeck	1,100,000
Schaumburg Lippe	4,300,000
Total	9,877,700,000

taxation, 1,488,100,000 gold marks; revenues from floating debt, 2,442,300,000 gold marks, from sundries, 20,200,000 gold marks; total revenues, 3,950,600,000 gold marks. Expenditures were: repayment of funded debt, 35,600,000 gold marks; interest on floating debt 145,500,000 gold marks; contribution to railways, 643,700,000 gold marks, execution of Versailles Treaty, 1,498,400,000 gold marks; sundries, 1,627,600,000 gold marks; total expenditures, 3,950,600,000 gold marks. Revenues from taxation during the fiscal year 1922 were as follows: income, property and indirect taxes, 1,143,400,000 gold marks; export duties, 162,500,000 gold marks; import duties and consumption taxes, 449,900,000 gold marks; total, 1,755,800,000 gold marks. Further analysis for revenues from taxation for the fiscal year 1920 showed income tax receipts of 1,214,600,000 gold marks; emergency contribution, 49,400,000 gold marks; turnover tax, 632,800,000 gold marks; other property and indirect taxes, 372,000,000 gold marks; customs, 235,100,000 gold marks; coal tax, 411,700,000 gold marks; other taxes on consumption, 251,100,000 gold marks; export duties, 344,800,000 gold marks; non-recurrent taxes, 23,700,000 gold marks. This last analysis of taxation is based on cost of living index and not on the dollar index. On July 23, 1914, the Reichbank gold reserve amounted to 1,356,800,000 gold marks. On Dec 31, 1923, the gold reserve was 445,700,000 gold marks, of which 21,300,000 were deposited abroad. The most important German government asset was the state railway system. In 1913-14 working receipts of state railways were 2,992,000,000 marks; working expenditures, 2,097,000,000. Total receipts were 2,994,000,000, total expenditures, 2,542,000,000, of which the expenditure for debt was 441,000,000; the net surplus was 452,000,000 gold marks. For the first nine months of 1923, the total receipts were 362,262,292,948,000,000 paper marks, total expenditures were 1,829,550,974,239,000,000 paper marks, leaving a net deficit of 1,467,288,681,291,000,000 paper marks. The number of persons employed on the railways, exclusive of Alsace-Lorraine, was 740,504 in 1913. In 1923 the number was 975,000. The number of train kilometers was 675,975,418 in 1913-14 and 519,190,207 in 1923, or 76.81 per cent of the pre-war figure.

History. Although the War came on the German people rather unexpectedly and there were immense popular peace demonstrations, organized by the Socialists, as long as it was only imminent, once the War had become an established fact it swept the German people into an orgy of patriotism and war enthusiasm

which increased with every new victory reported. The great majority of the Germans regarded the War as a struggle for their national existence, and the manifestoes of the Emperor and the other German sovereigns served to strengthen this belief and the patriotic ardor. Even the great Social Democratic party, concealing internal dissension regarding the War, supported the government from the start, and in conjunction with the other German parties, voted on Aug. 4, 1914, for the first war credits. On Sept. 9, 1914, the Socialist leaders protested against the anti-war activities of the International Socialist Bureau, and on December 2, the Socialists in the Reichstag voted for a second war credit. The government made efforts to keep the support of the Socialists and granted certain internal measures for which the Socialists had clamored a long time. This undivided support of the government on the part of the German people regardless of political opinion continued during the early part of 1915, but with the entrance of Italy in the War on the side of the Entente, in May, signs of a change in the war spirit began to appear. In March two Socialist members of the Reichstag, Liebknecht and Ruhle, had defied their party and refused to vote for the budget. In the same session, Socialists ventured to criticize the General Staff. In the August session, on the occasion of the debate on the war credits, the leader of the Socialists made a demand for democratic reforms and expressed the hope that peace would soon be a reality. How the unquestioning faith of the German nation in the government's conduct of the War had given way to a critical attitude became manifest in December of the same year when Scheidemann, the Socialist leader, interpellated the government in the Reichstag on possible peace terms and a strong Socialist majority protested against the annexationist spirit which was rampant in the country. At the same time an uncompromising minority of 18 Socialists voted against the war credits. It was evident now that in wide circles of the German people it was felt that the War had lasted too long already and that peace on moderate terms must be concluded at the earliest possible moment. Germans who had supported the government only because they regarded the War as one of defense on the part of Germany began to grow apprehensive of the steadily increasing appetite of the nationalists for wide annexations. Moreover, the internal reforms which the people expected as a compensation for their sufferings and sacrifices were not forthcoming. The most potent factor in the slackening of war enthusiasm was the food situation, which became more unsatisfactory with every day of the War.

The interruption of maritime communications with foreign countries and the ever-tightening hold of the Allies' blockade reduced Germany, which depended on import for most of its raw materials and a large part of its food supply, to a position where stringent measures had to be taken in order to prevent the army from being impeded by lack of war materials and to save the civilian population from starvation (See *BLOCKADE, ALLIED*). The government, as a result, set up a rigid system of centralized control in economic affairs. Maximum prices for certain foodstuffs had been fixed shortly after the outbreak of the War, but the prices of food continued to rise. Drastic ac-

tion soon became necessary to check the two main evils, the extravagance of consumers and the manipulation of the market by speculators. Early in 1915 all grain and flour was confiscated by the War Grain Association, and bread cards were introduced allowing each person a limited ration. A number of similar measures enforcing the strictest economy were put into effect during the course of the same year. At the same time provision was made to increase the cultivated area within the Empire and to curb profiteering. On May 22, 1916, a War Food Office was created, and subsequently meat and milk were rationed in the same manner as bread. In spite of these measures the situation grew worse during 1916 and further action became necessary. Meanwhile the shortage of textiles led to the establishment of a War Clothing Office in July, 1916. As for the financial situations, Germany attempted to meet the steadily mounting cost of the War through the issue of long-term war loans. By this system of piling loan on loan the financial indebtedness of Germany rose finally to the incredible amount of 161,000,000,000 marks. At this time little recourse was had to increased taxation, and only in 1916 and 1917 were new taxes imposed by the Reichstag, which proved, however, quite inadequate. By 1918 German finances were approaching hopeless disorder.

The ever-increasing sacrifices demanded of the German people gradually destroyed the patriotic harmony which had existed in the first period of the War. The disagreement between the navy department and the civil administration was paralleled by conflicts between the political parties. When in March, 1916, the Socialists voted for the U-boat resolution, a minority of 18 under Haase dissented and formed a new organization, the Social Democratic Labor Union, which henceforth showed uncompromising opposition to the War. Further friction developed late in 1916 between the military and naval authorities and the civil administration, because Bethmann-Hollweg showed a certain sympathy for the democratic reforms demanded by the majority in the Reichstag and was, moreover, not at all in agreement with the military leaders as to war aims and war methods, especially as to unrestricted submarine warfare. Lacking, however, in strength of character, he finally allowed himself to be dominated by the military leaders. Field-Marshal von Hindenburg, hero of Tannenberg and idol of the populace, and Quartermaster-General Erich von Ludendorff, who had become chief of the general staff and quartermaster-general, respectively, at the close of August, 1916, with increasing frequency assumed the right to dictate governmental policies; indeed, Ludendorff was little less than military dictator of Germany from 1916 to 1918, and his influence was constantly exerted in favor of annexationist war aims and political reaction. The Chancellor's policy of moderation was supported in the Reichstag by a majority consisting of the Centre, the Progressives, and the Social Democrats. In opposition were a minority of Conservatives and National Liberals on the Right, and on the Left the small group of ultraradical Socialists.

At the end of 1916 the food situation had become so serious that further steps had to be taken toward the strictest economy. Conditions were aggravated by the bad harvest of the year. Additional restrictions were put on

a number of articles, and substitutes were introduced, which served their purpose only ineffectively. To offset the shortage of labor the Auxiliary Service Law was enacted on Dec. 2, 1916; it compelled all males between 17 and 60 years of age to work. The stranglehold of the Allied blockade and the resulting economic distress reduced the civilian population to a state of mind where the demand of the nationalists and the military authorities for the immediate application of drastic methods of warfare, and especially of unrestricted submarine warfare, had a powerful appeal. The great mass of the Germans hoped for a speedy termination of their sufferings from these measures and saw little difference between their own privations and those which the submarine war might inflict on their enemies. Few Germans had any clear conception of the possible effects which America's entrance into the War might have. Thus public opinion drifted more and more into a spirit of desperate recklessness and swung over to the viewpoint of the General Staff. When the Chancellor, who in spite of his better judgment was by this time completely under the control of the military and naval authorities, announced on Feb. 1, 1917, to the Central Committee of the Reichstag that the government had decided to pursue a policy of unrestricted submarine warfare, the parties voiced little definite opposition. At the same time the majority maintained its desire for a speedy peace and its distrust of the government, which became clearly manifest in the great debate on war aims in May, 1917. This sentiment came even more strongly to the foreground during the following months because of the disappointing results of the submarine campaign, the energetic participation of the United States in the War, the feeling that Germany was facing overwhelming odds, and the reluctance of the government to grant electoral reforms. On July 16, 1917, Erzberger, the leader of the Centre and of the majority, made a sensational speech in the Central Committee of the Reichstag, in which he repudiated submarine warfare and demanded immediate steps in the direction of peace. He was supported by the Centre, the Socialists, and the Democrats, the parties constituting the majority, which were now in full opposition to the Chancellor, in whose policy they had lost all faith. The parties of the Right were equally strongly opposed to the Chancellor because he did not go far enough to suit their extreme nationalistic tendencies. Bethmann-Hollweg tried in vain to placate both the Right and the Left, the one by his statement in committee on July 10 that the formula of peace without annexations was not acceptable, and the other by inducing the Emperor on July 11 to issue a declaration promising a franchise reform in Prussia. He was forced to resign on July 14, 1917, and was succeeded by Dr. Michaelis, who also soon found himself in a difficult position in the Reichstag. On July 19 the Centrists, Socialists, and Democrats carried by a majority of 90 votes a resolution calling for a peace by agreement and rejecting forced annexations and any policy of political, economic, or financial coercion after the War. The resolution declared, moreover, that, in case any such peace should be impossible of attainment, the Germans would stand together as one man and carry on a fight for their existence. Michaelis

stated that he was ready to accept the Peace Resolution "as he understood it." This latter phrase created immediate antagonism, which developed into open hostility during the fall of the year. A cabinet crisis arose in the early part of October when Michaelis attempted rather clumsily, in the course of a debate in the Reichstag, to construe the connections of some of the Independent Socialist leaders with the mutineers in the navy earlier in the year into something akin to treason. This sealed Michaelis's fate, and by October, 1917, all parties except the Conservatives agreed that he was impossible. On October 23 they informed the chief of the Emperor's Civil Cabinet to this effect and Michaelis resigned five days later. His successor was von Hertling, Bavarian Prime Minister and veteran leader of the Centre, who appointed the Progressive leader, Payr, as Vice Chancellor in Helfferich's place. The circumstances which brought about Hertling's appointment and the fact that he accepted the Peace Resolution as a basis for his policy led many to regard him as the first parliamentary chancellor of Germany. Hertling promptly denied the truth of this assumption and proved the bureaucratic character of his office by introducing into the Prussian Diet a franchise bill which was only a tardy step in the direction of electoral reform, and which circumscribed the powers of the Lower House.

While the year 1918 opened under rather favorable political circumstances and with great military success, the economic situation gave little cause for rejoicing. Milk, meat, and fats were becoming luxuries. There were now widespread transgressions of the food regulations, and profiteering had grown apace. The steadily increasing antagonism between town and country made the equitable distribution of foodstuffs very difficult. Likewise the scant supply of fuel, textiles, and other materials was a serious problem to the authorities. There could be no denying now that the machinery of bureaucratic central control, which had functioned so smoothly in former times, was beginning to break in many places under a pressure which had been too heavy and too long sustained. The military successes of the spring and the benefits accruing from the Bolshevik Revolution, two factors which had brought about a temporary revival of the annexationist spirit, were only a partial compensation for the grave internal situation. The war-weariness of the civilian population advanced rapidly as a result of the economic distress, and with it went a hitherto unknown spirit of dissatisfaction with a government which seemed either unwilling or unable to improve matters and abolish abuses. The great strikes in January, 1918, had been a manifestation of this sentiment, and it became further evident through the renewed pressure of the majority in the Reichstag for a peace by diplomacy. Moreover, the behavior of the military leaders in the negotiations with Soviet Russia and the failure of the peace treaties with Russia and Rumania to lead to a general peace undermined confidence in the government still further. Erzberger, who had set himself up as the leader of the peace movement, became increasingly hostile to the government in spite of the fact that both he and Hertling were leaders of the same party. How incapable the government was of grappling with the internal situation was made evident by its only concession

to the German people at this time, a law enacted by the Reichstag on June 8, 1918, by which the number of Reichstag deputies for the larger municipal and rural constituencies was increased and proportional representation was provided for the election of these additional deputies.

Germany's military strength had thus far enabled the government to restrain the movement for peace in the Empire. But in the summer of 1918 military reverses presaged an internal crisis. On June 21, Foreign Secretary Kühlmann, in a sensational speech in the Reichstag, declared it was no longer possible to attain peace by force of arms. It is true that the Chancellor repudiated this statement in the next sitting and that Kühlmann was forced to resign, but during the following month came the final offensive of the Allies on the Western front, and with it the movement for peace in Germany entered its last stage. The aggressiveness of the Socialists increased with every new German reverse, and with the defection of Bulgaria the Hertling cabinet was forced out of office. Prince Max of Baden formed a new government with a programme of radical democratic reforms and peace on the basis of President Wilson's Fourteen Points. The grim course of events made short work of his plans. After four years of hardship and sacrifice the spirit of revolution had gripped the German people, and in the face of the impending Allied military victory their former discipline had given way to panic and to a naïve confidence that by complete surrender a just peace could be obtained. At the same time the Chancellor received frantic requests from the German General Staff that immediate application be made for an armistice, since only the cessation of hostilities could save the German army from military disaster. Events followed each other in rapid succession. The Revolution broke out in Kiel in the first days of November. A series of mutinies occurred in the navy, and the Republic was proclaimed in the principal seaports. In Munich, Kurt Eisner set up a red republic on November 7. Two days later the Revolution had spread to Berlin, and Prince Max turned the government over to Ebert, leader of the Socialists. The Emperor fled to Holland on the following day, but did not sign the abdication document until November 28. For the account of the course of the diplomacy of the Central Powers during 1914-18, see *AUSTRIA-HUNGARY and WAR DIPLOMACY*.

The Revolution was now in full swing. In Berlin the overthrow of the Imperial government took place without armed resistance from the monarchists. Although the revolutionary movement had been actually engineered by the Independent Socialists, and the Majority Socialists had not taken part until the Revolution was an established fact, the latter now assumed full charge of it and steered it into rather moderate channels to forestall the establishment of a Soviet republic. A provisional government was formed in Berlin under the title of the People's Commissaries, which immediately appointed a cabinet consisting almost entirely of non-Socialists. Thus the machinery of government was started running and Germany was helped over the dangerous period of disorder which otherwise would have led to the establishment of an ultraradical government. Meanwhile revolutionary Workmen's and Soldiers'

Councils had sprung up and assumed power everywhere in the Reich. The chief element of opposition to the provisional government was the Workmen's Council in Berlin, which claimed supreme legislative authority for the whole Reich. In the full realization of this serious situation the government called a congress of delegates from all the councils. At this congress, held in Berlin on Dec. 16, 1918, executive power was delegated to the six People's Commissaries, who thereupon issued at once a call for elections for a National Assembly. Thus the Berlin Council as the chief element of opposition was definitely eliminated. Foiled in their designs, the ultraradicals under the leadership of Karl Liebknecht and Rosa Luxemburg organized the Spartacus League and attempted by force of arms to seize power and to set up a dictatorship of the proletariat. After minor disturbances the Spartacist Sailors' Division started a revolt in Berlin on Dec. 23, 1918, which was subdued by the government by means of regular troops on the following day. Primarily as a result of this drastic action of the government, the three Independent Socialist members in the Council of Commissaries, who favored a more revolutionary policy, resigned during the last days of December and were replaced by Majority Socialists. In January, 1919, a new and more vigorous Spartacist insurrection occurred which was put down by Noske, the Majority Socialist Minister of National Defense, only after sanguinary fighting in the streets of Berlin. Renewed uprisings in Berlin during March and in various other cities during April were quelled by the Reichswehr. With the close of these revolts the Majority Socialist government had weathered the threatening danger from the Left for the time being.

The elections to the National Assembly in January, 1919, showed a great increase in the Socialist vote, although the recruiting strength of the Socialist parties had suffered considerably from their internecine strife. The combined Socialist vote was 13,750,000, against 16,000,000 votes for the bourgeois parties, and the two Socialist parties secured 185 seats in the Assembly out of a total of 421. The revolutionary transformation which had occurred in Germany, and, paradoxically, the continuity of the new republican régime with the old order, were significantly exemplified in the metamorphosis of the political parties which entered the National Assembly. The German National People's party (popularly, the Nationalists), with their 42 delegates, were simply representatives of the old parties of the Right, i.e. the Conservatives and Free Conservatives; they were opposed to democracy, to Socialists and Jews, and to the Treaty; they represented monarchist and militarist reaction. The German People's party, with 21 delegates, was the emaciated but influential successor of the old National Liberal party, the party of big business, and soon became almost a personal faction representing the coal and iron king, Hugo Stinnes. The Christian People's party, with 88 representatives, was so clearly recognizable as the quondam Catholic Centre that the old name was used more frequently than the new. The Democratic party, heir to the old Progressive party, showed surprising strength, with its 75 representatives and distinguished leaders, one of whom was to draft the new constitution. With the addition of 10 independents, these bourgeois parties mus-

tered 236 votes in the new Assembly, as against 163 moderate Social Democrats, i.e. Majority Socialists, and 22 more radical Independent Socialists. These returns showed clearly that the revolution begun by admirers of Russian Bolshevism had taken a nonsocialist turn, but the danger of social revolution was not wholly averted. Fearing revolutionary upheavals in the capital, the new Parliament assembled on Feb. 6, 1919, in Weimar instead of Berlin, and elected on February 11 the Socialist Ebert as President of the Reich. Immediately afterward a coalition cabinet, consisting of Majority Socialists, Centrists, and Democrats, was formed by Scheidemann. The Right, composed of the Nationalists and the People's party, and the extreme Left or Independent Socialists opposed the new government and did their best to block its measures. It was the ratification of the Treaty of Versailles, however, which caused the first cabinet crisis in Republican Germany. Scheidemann, who by previous statements had committed himself to non-ratification of the Treaty, resigned with his cabinet on June 21, in order to leave the President free to take the necessary steps for ratification. After some difficulties the Majority Socialist Bauer formed a new cabinet of Centrists and Socialists. A majority in the Reichstag, consisting of the Majority Socialists, the Independent Socialists, the Centre, and some of the Democrats, thereupon authorized the government, on June 23, to sign the Treaty. On June 28 the German representatives duly affixed their signatures, and the Reichstag approved the Treaty on July 9.

On July 31, 1919, the new constitution, drafted chiefly by Professor Preuss, was adopted in the Reichstag by 262 votes against 75. While it contained all the characteristic juridical features of any modern constitution, it applied the democratic principle of equal rights with an almost unprecedented thoroughness and included a number of educational, economic, and social provisions which were distinctly novel. It was divided into two parts: the composition of the Reich, and the fundamental rights and duties of Germans. The German Reich was declared to be a republic whose sovereignty was to be vested in the people. It was provided that each state should have a liberal constitution and a parliament elected by universal, equal, and secret suffrage. All citizens over 20 years of age were to receive the vote, women as well as men. To avoid any inequality, elections were to accord with the principle of proportional representation, and the same democratic franchise was to govern elections to every German diet and municipality. The Reichstag was to be elected for four years. The President, elected for seven years by a direct vote of the people, was to have power to conclude treaties, receive ambassadors, etc., but declarations of war and peace were to be issued by the Reichstag, and treaties with foreign states were to be ratified by it. The Chancellor and the ministry were to be nominated by the President, and the former was to direct the foreign policy and to be responsible for the cabinet. The Imperial Council was to be composed of the representatives of the states, each of which was to have at least one vote; the votes of the large states were to be proportionate to their populations. The laws were to be submitted to a plebiscite if the President de-

sired. Article 18, permitting the alteration of state boundaries by the national government with the consent of the population of the regions concerned, was one of many examples of the strongly national and centralized nature of the new government, as contrasted with the federal constitution of the defunct Empire. This article was later taken advantage of to consolidate eight Thuringian duchies and principalities (Saxe-Weimar, Saxe-Meiningen, Saxe-Altenburg, Saxe-Gotha, Schwarzburg-Rudolstadt, Schwarzburg-Sonderhausen, and the two principalities of Reuss) into a unified state of Thuringia (q.v.), and to unite Saxe-Coburg with Bavaria, thus reducing the number of states in the Reich from 25 to 17. The most important feature of the second part of the constitution was the article providing for the establishment of a system of industrial democracy through works councils and an economic parliament for the Reich. The latter, the Economic Council, was to give an opinion on all bills of an economic and social character and was also to have power to propose such measures. The Council, however, was not to be a legislative organ. Important also was the opening provision of article 151: "The ordering of economic life must reconcile the principle of economic justice with the aim of a civilized life for everybody." The most unusual clause, in many respects, provided that in the schools of the Reich every effort must be made to inculcate a spirit of conciliation with the other peoples of the world.

In September, 1919, the cabinet was enlarged by the reëntance of the Democrats. At the same time the Works Councils Bill was passed by the Reichstag. As adopted, the bill represented a compromise and did not by any means embody the radical principles which had been originally proposed, nor was it applied without further moderating compromises, bitterly as the Socialists protested. Another important event of the legislative session was the Socialization Law with reference to the mining industry. Republican Germany had taken over a cheerless economic heritage from the imperial system. After the Revolution, conditions had become more desperate month by month. The debt had risen to 220,000,000,000 marks, the budget amounted to 15,000,000,000 of ordinary expenditure and to 41,000,000,000 of extraordinary expenditure. New sources of revenue had to be found, and with this end in view, Minister of Finance Erzberger proposed an "emergency contribution" which amounted to a partial confiscation of wealth. The measure was passed by the Reichstag on Nov. 17, 1919, by 238 votes against 43.

The application of the Peace Treaty, which went into effect on Jan. 10, 1920, caused universal discontent in Germany. The Allies' demands for the extradition of the war criminals, including the foremost military leaders of Germany, and for the reduction of the German army in accordance with the treaty, were especially potent in arousing national feeling which reacted directly against the republican government. The impotence of the latter in the face of the relentless pressure from the victors served to weaken the Republic, whose position had been none too secure from the beginning. Aside from the dangerous opposition of the revolutionary Left, there were powerful nationalist sections which had never become reconciled to the new state of affairs and which were only waiting for an opportune moment to reestablish

the old order. Accordingly a counter-revolution broke out in March, 1920. Under the leadership of Dr von Kapp and General von Lüttwitz, the monarchists, together with dissatisfied troops who were to be disbanded in conformity with the demands of the Allies, seized Berlin on March 13 and set up a new government. The Republican government, forced to seek refuge in Stuttgart in Württemberg, appealed to the workers to declare a general strike. The entire trade union movement of Germany responded to the call, and the organized hostility of the workers throughout the Reich compelled the counter-revolutionists to evacuate the capital after five days of undisputed military power. The Kapp Putsch, as the counter-revolutionary attempt was generally called, showed clearly the lamentable weakness of the republican government. The only reassuring element in the situation was the strength of republican sentiment among the masses of the German people and the power of action manifested by the trade union movement. After its return to Berlin the government was attacked by the radical Socialists and organized labor for its weak conduct and its ignominious flight. Unable to satisfy the demands of the trade unions for far-reaching democratic reforms, the Bauer government fell from power on March 26 and was replaced by a new coalition government under Hermann Müller, composed of Majority Socialists, Centrists, and Democrats. A direct result of the Putsch was the stricter application of democratic principles to the civil service. More serious than the Putsch itself, which was in reality a ludicrous attempt at a monarchist revolution on the part of a few reactionaries with very limited political vision, were its indirect consequences, particularly the revival of radical revolutionary disturbances in the Ruhr, the Vogtland, and other districts. The workers in the Ruhr organized a proletarian army against the monarchists, defeated them, and took possession of the towns and the mines. Because of the revolutionary aspect of the movement, the Berlin government was compelled to send troops into the district; after some bloodshed, peace and order were restored. In Bavaria the March insurrection led to the complete consolidation of the reaction which had been steadily marshaling its forces since the overthrow of the Soviet government in April, 1919. Meanwhile France had become alarmed at the presence of large bodies of troops in the Ruhr, which under the treaty had been included in the demilitarized zone, and had retaliated by occupying Frankfurt and the Maingau. Germany appealed to the League of Nations, but without avail. At the Conference of San Remo in April, 1920, the French agreed to withdraw as soon as the German troops in the Ruhr had been reduced to the required strength. The action of the French, however, and especially their firing on civilians in the city of Frankfurt, was a powerful factor in strengthening national feeling throughout the Reich. Another manifestation of the restlessness prevailing in 1920 was the tragic shooting of demonstrators before the Reichstag building on January 13.

The elections for the first German Reichstag on June 6, 1920, were unfavorable to the coalition. Both the Right and the Left gained as a result of the year's events. The representa-

tion of the various parties in the Reichstag was as follows: Majority Socialists, 110; Independent Socialists, 80; Centrists, 87; Nationalists, 65; German People's party, 61; Democrats, 45; Christian Federalists, 21, minor parties, 11. In view of the changed parliamentary situation a new coalition cabinet was formed by the Centrist Fehrenbach: it consisted of Centrists, Democrats, and members of the German People's party. The new government soon had to face difficulties in regard to reparations; after considerable wrangling, these ended with the acceptance of the Allies' demands by the Germans. Each move of coercion on the part of the Allies weakened the none too stable republican government. Nationalist feeling was further strengthened by the decision of the Ambassadors' Conference awarding a small part of the plebiscite area in East Prussia to Poland, although the plebiscite had resulted in an almost unanimous German vote. Due to the insistent demands of the Allies, the Reichstag passed measures in July to bring about the disarmament of the civilian population, the actual application of which was, however, rather difficult. An important event of the latter part of the year was the disposal of the problem of socialization of mines. Of two proposals presented by the Socialization Commission, the one favoring the mine owners was adopted by the joint committee of the Economic Council and the Coal Council. The measure failed to meet the approval of the miners, and nationalization of mines was abandoned for the time being.

Between the Armistice and the end of 1920, the internal situation in the Reich had changed very materially. The Revolution had for the most part spent its force as far as the great mass of the German people were concerned. In place of the old aristocracy a new ruling class had arisen which was amassing vast wealth and was gaining complete control over the means of production. The workers and the middle classes were becoming impoverished as a result of the Peace Treaty and the rise of the new plutocracy. Thus Germany presented the amazing spectacle of a country in which political power was directed by democratic and socialistic principles, but in which the real power was wielded by a few all-powerful captains of industry. At the same time large sections of the people were going over to the extreme Right and Left, both of which were hostile to the Republic. Due to the Treaty and the Allies' policy, nationalist feeling was gaining day by day and communism became more and more a factor with which republican statesmen had to reckon. Late in 1920 the majority of the Independent Socialists embraced the doctrine of the Third International and in conjunction with the Communists formed the United Communist party of Germany. At the instigation of this party serious revolutionary risings occurred in Central Germany in March, 1921, which the government was able to quell only after considerable difficulties.

Meanwhile the reparations policy of the Allies took its course with fateful consequences for the German political and industrial situation. When the German statesmen refused to accept the severe demands of the Conferences of Paris, Jan. 24-29, 1921, and of London, Feb. 29, 1921, negotiations were broken off, and the Allies imposed their "sanctions." At a third conference, in London, May 1-5, 1921, the Allies

decided on an ultimatum which forced the Fehrenbach government out of office. The new government under Dr. Wirth, consisting of Centrists, Socialists, and Democrats, undertook the fulfillment of the Allies' demands. In this spirit Walter Rathenau, the German Minister of Reconstruction, concluded with Louis Loucheur, the French Minister of Reconstruction, the so-called Wiesbaden Agreement providing for the delivery to France of German materials to be credited to the reparations account. The policy of fulfillment, and especially the Wiesbaden Agreement, met with bitter criticism from the nationalists, particularly when the expected results were ultimately not forthcoming. The government's efforts to pay were seriously impeded by the cataclysmic fall of the mark, and for this reason the subject of reparations came up again. The position of the government was injured still further through the remonstrances of the Allies concerning disarmament, the disbanding of secret military organizations, and the inadequacy of the verdicts rendered by German courts against the so-called war criminals. The intensity of nationalist feeling at this time became clearly apparent through the murder of Erzberger by a nationalist zealot on Aug. 26, 1921. The worst blow of the year, however, and the factor which more than any other since 1918 decreased the industrial strength of Germany and at the same time served to fan nationalist feeling to white heat, was the partition of Upper Silesia. The plebiscite of Mar. 20, 1921, had resulted in a two-thirds vote for Germany, whereupon the Poles, fearing a decision unfavorable to them, started an insurrection. Allied troops interfered only when the German population had been given full opportunity to realize that it was at the mercy of the victor. The final award of the Supreme Council, which was based on the report by a commission of the League of Nations, gave the greater and most valuable part of the Upper Silesian industrial district to Poland. On the official publication of the verdict, the Wirth government resigned, but it resumed office again after a reorganization of the coalition cabinet. (For a full discussion of the problem, see UPPER SILESIA.)

The reparations problem, the cause of all unrest and anxiety, was acute once more at the end of 1921 and assumed an even graver aspect during the following year. The Conference of Genoa in April, 1922, lost much of its significance because France agreed to participate only on the condition that reparations should not be officially discussed. On Easter Sunday, Apr. 16, 1922, the German and Russian delegates concluded at Rapallo a treaty whereby peace was reestablished between their countries, and both sides waived all claims arising from the War. This pact aroused a storm of indignation at the conference, which no assurance of good faith on the part of the Germans could pacify. Both Germans and Russians denied that the treaty contained any secret clauses working to the prejudice of the Allies. In May a moratorium for the year 1922 was granted to Germany by the Reparations Commission, in return for which the Wirth government promised to take measures toward balancing the budget, provided that an international loan was arranged in due time. Subsequently a loan committee, of which the American banker J. P. Morgan was a member, was formed to study the

German finances. Any constructive work on the part of the committee was blocked by the refusal of the French government to make a loan dependent on the modification of the French demands. While the reparations problem was thus hanging over Germany like the sword of Damocles the country was sinking ever deeper into the abyss of political hatred and financial and economic disorder. In the summer of 1922 nationalist conspirators made attempts to murder Scheidemann and Harden and succeeded in assassinating Walter Rathenau, the Foreign Minister. This crime created a violent outburst of popular indignation throughout the Reich, and since it was evidently intended to be a blow at the Republic—Rathenau being the outstanding figure in German political life—a law for the protection of the Republic was enacted. The murder showed clearly the depths of political dissension in Germany. The foes of the Republic made the Revolution and republicanism responsible for all the misery which had descended on Germany. Meanwhile the mark had begun its spectacular downward movement, and in October, 1922, the dollar exchange had mounted to 3000. The depreciation of the currency provoked confusion in public finances and a complete revolution in prices with all its disastrous consequences. Wages and salaries could not keep pace with prices, and terrible suffering befell the population, particularly the middle classes. The only people who profited by this lamentable situation were the industrialists, the profiteers, and the farmers. The Wirth government tried vainly to stabilize the mark, and conditions continued to grow worse as the year advanced. At the same time changes had occurred in the parliamentary situation which brought about a cabinet crisis. The Majority and Independent Socialists had re-united at the Unity Conference of Nuremberg, and as a result the United Socialist party had taken a turn to the Left. Chancellor Wirth sought to reconstruct the coalition government by the inclusion of the German People's party. To this, the United Socialists would not assent, because, not without justification, they regarded the latter party as officially republican, but unofficially and in sentiment as thoroughly monarchist and reactionary. The Wirth government fell thereupon and was succeeded by a business cabinet under Dr. Cuno. This was composed entirely of bourgeois politicians; the German People's party was its driving force.

Although the Cuno government pursued the same reparations policy as its predecessor, a deadlock soon appeared between the Reparation Commission and Germany over a comparatively small default in the delivery of coal, and as a result the French and Belgians, in January, 1923, occupied the Ruhr industrial district. This action aroused the most bitter resentment and denunciation throughout the Reich. The occupation and the passive resistance of the local population, which was encouraged and actively supported by the German government and people, led to a revival of patriotic ardor and monarchist activity. A still more fateful consequence was the rapid aggravation of the economic and financial situation. When the Ruhr, the chief centre of Germany's economic life, ceased work, production all over the Reich was seriously impeded, and there was an unprecedented increase in unemployment. Moreover,

inflation continued without interruption, because the enormous cost of passive resistance in the Ruhr necessitated an ever-increasing output of paper money. On May 31, 1923, the mark sank below the Austrian crown and collapsed completely during the following months, in spite of all efforts at stabilization. The rapidity of the mark's decline was equaled only by that of the rise of prices, with which wholesale increases in salaries and wages could not keep pace. With the growing depreciation of the mark, the food situation became more alarming, since the farmers were very reluctant to exchange their products for worthless paper money. All faith in the mark vanished completely during the summer and fall, and business and labor began to make loud demands for real money. It seemed indeed as if Germany were headed for the final breakup. All these internal factors brought about the fall of the Cuno cabinet on Aug. 12, 1923; the immediate cause was the withdrawal of Socialist support in the Reichstag. Stresemann, the leader of the German People's party, formed a new coalition from members of his own party, the Centrists, the Socialists, and the Democrats.

The new government assumed office with the promise of taking immediate and drastic steps to untangle the complicated foreign and domestic problems, and with this end in view acknowledged defeat in the Ruhr by abandoning passive resistance. Likewise, vigorous action was taken in regard to the critical problems of taxation and finance, and for a brief period hope was revived. But the measures adopted led to renewed difficulties with the nationalists, industrialists, and communists. By means of a modified form of martial law, serious outbreaks of the extreme Right and Left were narrowly averted, but the steady pressure of the moderate Right, which objected primarily to the drastic financial reforms of the radical Socialist Minister of Finance, Hilferding, forced the resignation of the Stresemann cabinet on October 3. Since no other chancellor was available at this particular time, the Stresemann coalition resumed office after Hilferding had been replaced by a Centrist. In order to render the government more stable in the face of the extraordinary internal situation, a bill was passed by the Reichstag on October 13 suspending certain constitutional rights and liberties and vesting the government with extraordinary power to issue such decrees relative to the financial, economic, and social conditions as might be warranted by the situation. Such drastic measures seemed necessary, indeed, for the misfortunes of the year culminated in November in a series of events which came near disrupting the fragile structure of the Republic. In October the Rhenish separatist movement (see RHINELAND) had come to a head, and in the closing months of the year the separatists in the Rhineland and the Palatinate, who were comparatively few in numbers and recruited for the most part from the dregs of the population, succeeded, with the connivance of the French and Belgian authorities, in gaining possession of a number of towns. The local population, worn out by the long period of occupation, was cowed by French and Belgian military force. But once the armies of occupation, under pressure from the English and influenced by international public opinion, withdrew their support, the flimsy structure of the "Rhenish Republic" fell to

pieces; and the movement petered out in the early months of 1924. Another danger lay in the rising tide of extreme nationalism, which had found a safe haven in reactionary and monarchist Bavaria. On November 8 the extreme monarchists in Munich under the leadership of Ludendorff and Hitler executed an abortive coup, commonly called the Beer Hall Putsch. Although the coup was easily frustrated and was in itself a rather childish affair, it served to show the extent and boldness of the extreme nationalist movement. More serious was the constant friction between the republican government of the Reich and the reactionary government in Munich. It was only through a policy of diplomacy and forbearance that Berlin succeeded in preventing an open break between the Reich and Bavaria. While proceeding in the delicate Bavarian situation with the utmost caution, the government used coercion against the recalcitrant Communist and radical Socialist governments of Saxony and Thuringia which were removed by use of the federal military and replaced by moderate Socialist governments. The summary action against "Red Saxony" and the forbearance of the government against monarchist Bavaria caused the Socialists to withdraw from the cabinet. These developments, together with Stresemann's announcement of the abandonment of all assistance to the people in the occupied regions, resulted in a vote of no confidence in the Reichstag and consequently the resignation of the government on Nov. 23, 1923. After a whole week of fruitless endeavor a new coalition government, consisting of the Centre, the Democrats, the German People's party, and the Bavarian People's party, was formed with Dr. Wilhelm Marx as Chancellor. At the request of the new Chancellor, the Reichstag, by a vote of 313 to 18, gave the government plenary powers without parliamentary sanction for an indefinite period. The chief purpose of this act was to empower the government to take drastic action in regard to the critical social and economic situation. Late in 1923 currency reforms were inaugurated whereby a Rentenbank was established which issued a new currency token, the Rentenmark, to be covered by a hypothecation of the entire wealth of Germany. Alongside it, the old paper mark and the mark of the gold loan in August were temporarily to remain legal tender. When the Rentenmark, which was worth somewhat less than a quarter of a dollar, came into circulation it was worth exactly 1,000,000,000 paper marks, but with its appearance the inflation of the paper mark came to a halt. As a result of the introduction of a fixed-value currency, prices early in 1924 were put definitely on a gold basis and general confidence in the currency began to return. At the same time the food situation and the condition of the middle and working classes became worse for several reasons, chiefly the fall in wages and the lengthening of working hours. While the stabilization of the currency had thus been attained through the issue of the Rentenmark, the balancing of the budget remained an open problem. Meanwhile the Dawes Committee of experts had begun its investigation of German finances, and under its indirect influence an important step was taken in the direction of budget reform in January, 1924; this was the temporary repudiation of the public debt until after payment of reparations. Further meas-

ures aiming at improvement of the financial situation were introduced in the spring of 1924, and as a result there was a continued recovery of Germany during the first half of the year, not only in regard to finances, but also in a general economic sense. While the food situation was still grave and there was by no means cause for rejoicing, yet it was felt that the worst was over. This feeling was strengthened by the Dawes Report (see REPARATIONS) and by the results of the French elections in May, 1924. The Dawes Report was regarded by most Germans as acceptable in the main, not because of its satisfactory conditions, but because it seemed to supply a basis on which in due time an ultimate accord on reparations might be reached, especially as it was backed by the prestige of the United States. Even the nationalists were not outspoken in their opposition to it.

The Reichstag, which had been in session for four years, was dissolved on Mar 13, 1924, and new elections were held on May 4. The results were approximately as follows: Socialists, 100; German National party, 96; Centrists, 62; Communists, 62; German People's party, 44; People's Freedom party, 32; Democrats, 25; Bavarian People's party, 16; minor parties, 28. The outstanding feature of this election was the strengthening of the extreme Right and Left at the expense of the middle parties supporting the Republic. It is true that much larger inroads on the republican majority had been expected; yet the coalition upholding the Republic had been left only a narrow working majority. At the same time the German People's party, the parliamentary tool of the great industrialists, although nominally a member of the republican coalition, was in spirit thoroughly monarchist. Thus the Republic rested on a more precarious basis than at any other time since its creation, if the line-up of the political parties may be taken as a criterion. As a matter of fact, matters were even worse than the parliamentary situation indicated, for many Germans who had nationalist and monarchist sympathies voted for republican parties chiefly out of consideration for the Dawes Report. Ever since 1919 there had been an uninterrupted swing to the Right and the Left. After the Armistice the republic was looked on by the great majority of the German people as established, and the monarchy was to all intents and purposes dead. But the Peace Treaty and all its dismal consequences, reparations, the Ruhr occupation, the never-ending national humiliation, and the resulting economic misery, had destroyed faith in the republic and induced most Germans to seek salvation in monarchism or communism. In view of the large Nationalist representation the Marx cabinet resigned after the election, and President Ebert turned to the Nationalists for the formation of a new coalition government, but the latter, who were perhaps not overanxious to assume office at this particular time, advanced such extreme conditions, such as the nomination of Admiral Tirpitz as chancellor, that President Ebert fell back on ex-Chancellor Marx. The latter resumed office for the time being with a coalition, consisting of the Centre, the Democrats, the German People's party, and the Bavarian People's party. With the support of the Socialists, this government had a slight majority in the Reichstag. The attitude of the

nationalists was due primarily to their unwillingness to take a definite stand for or against the Dawes Report. Early in June, 1924, the Reichstag by a majority of 64 voted in favor of acceptance of the Dawes Report, and immediately steps were taken to draft the laws required under the plan. In the latter part of June the government of the Reich showed its willingness to accept military supervision by the Allies. These developments, together with the moderate policy announced by the new French Radical Socialist government, augured well for the gradual solution of Germany's complicated problems. See BADEN; FREE STATE OF; BAVARIA; PRUSSIA; SAXONY; SCHLESWIG; THURINGIA; WÜRTTEMBERG; also NAVIES OF THE WORLD.

GEROULD, GORDON HALL (1877-). An American philologist, born in Goffstown, N. H. He has been a member of the faculty of Bryn Mawr and after 1916 was professor of English language and literature at Princeton. He is the author of *The North England Homily Collection* (1902), *Sir Guy of Warwick* (1905), *Selected Essays of Fielding* (1905), *The Grateful Dead: The History of a Folk Story* (1908), *Saints' Legends* (1916), *Peter Sanders, Retired*, a novel (1917), *Youth in Harley*, a novel (1920), and other works. In 1918 he was a captain in the United States army.

GEROULD, JOHN HIRAM (1868-). An American zoologist, born at Stoddard N. H., and educated at Dartmouth College and at Harvard. He was instructor in zoölogy at Dartmouth (1894-1915), assistant professor (1915-1918) and professor (1918-). Professor Gerould published articles in zoölogical journals on the development of sipunculids and holothurians, and on the genetics of butterflies and moths.

GEROULD, KATHARINE FULLERTON (1879-). An American writer, born at Brockton, Mass., and educated at Radcliffe College. She was a reader in English at Bryn Mawr, 1901-10. In addition to many articles in magazines she published *Vain Obligations* (1914), *The Great Tradition* (1915), *Hawaii, Scenes and Impressions* (1916), *A Change of Air* (1917), *Modes and Morals* (1919), a collection of essays; *Valiant Dust* (1923), a collection of short stories; and other volumes. Mrs. Gerould has been criticized as weighing down a distinct literary talent with an unbending conservatism, which though it does not attract the masses, has a coterie of faithful admirers.

GEST, MORRIS (1881-). A theatrical producer born in Vilna, Russia. He came to the United States in 1893 and was educated in the public schools of Boston. He began his theatrical business in Boston and since 1905 has been a member of the firm of F. Ray Comstock and Morris Gest in New York. This firm has produced more than 50 plays. Among its most notable successes are *Experience* (1914), *The Wanderer* (1917), *Chu Chin Chow* (1918), *Aphrodite* (1919), and *Mecca* (1920). Balieff and his Chauve-Souris artists were presented to the American public by this management (1922) and the Moscow Art Theatre (1923). During the 1923-24 season it produced *The Miracle* under Max Reinhardt's direction and plays starring Eleonora Duse, and Sir John Harvey.

"GESTALT" PSYCHOLOGY. See PERCEPTION.

GIBBONS, FLOYD (PHILLIPS) (1887-).

An American journalist and war correspondent, born at Washington, D. C., and educated at Gonzala College and Georgetown University. In 1907 he entered the newspaper field as a staff member of the Minneapolis *Daily News*, later joining the staff of the Milwaukee *Free Press* and the Minneapolis *Tribune*. In 1912 he went over to the Chicago *Tribune*. In 1917 he was London correspondent for the Chicago *Tribune* and a year later went as war correspondent to France, where he was wounded in the Battle of Château-Thierry. He was awarded the French and Italian Croix de Guerre. After the Armistice he became foreign director of the Chicago *Tribune* and editor of the European edition published in Paris.

GIBBONS, HERBERT ADAMS (1880-). An American author, born at Annapolis, Md., and educated at the William Penn Charter School in Philadelphia, the University of Pennsylvania, and Princeton Theological Seminary. He was ordained to the Presbyterian ministry in 1908, and until 1919 was correspondent in Turkey and in Europe for various American periodicals. From 1910 to 1913 he was professor of history and political economy in Robert College, Constantinople, and in 1919 was named honorary associate professor in the Army War College, Washington, D. C. His publications include *The New Map of Europe* (1914); *The Foundation of the Ottoman Empire* (1915, 1921); *The New Map of Africa* (1916); *Reconstruction of Poland and the Near East* (1917); *The New Map of Asia* (1919); *Venizelos* (1920, 1923); *Bases of Anglo-Saxon Solidarity* (1921); *Lithuanian Recognition* (with W. G. McAdoo; 1921); *An Introduction to World Politics* (1922); and *Europe Since 1918* (1923).

GIBBS, SIR PHILIP (1870-). An English newspaper correspondent and writer. He was educated privately, and after several years of editorial work, he entered journalism in 1902. He was literary editor for several papers. He served as war correspondent with the Bulgarian army in 1912 and with the French and Belgian armies in 1914. From 1915 to 1918 he reported field operations of the British armies in France. His daily articles gave vivid and sustained descriptions, particularly of the human side of war. He was knighted in 1920. In 1921-22 he was editor of *The Review of Reviews*. He was the author of many books relating to the Great War and of several novels. His works include *The Soul of War*, *Battles of the Somme*, *The Way to Victory*, *The Hope of Europe*, *Now It Can Be Told*, *More Than Can Be Told*, and *Heirs Apparent*, a novel (1924). He lectured in the United States in 1921, 1922, and 1923.

GIBSON, CHARLES DANA (1867-). An American illustrator (see VOL. IX). During the War he did some notable work as cartoonist. Later he purchased a controlling interest in *Life*, of which he assumed entire charge in April, 1920.

GIBSON, HUGH (1883-). American diplomat, born at Los Angeles, Cal., and educated for the diplomatic service at the Ecole Libre des Sciences Politiques at Paris. Between 1908 and 1919 he held various diplomatic posts in Central America, England, Belgium, and France, and was a member of special committees or missions in Washington, Santo Domingo, and the countries of the former Austro-Hungarian Empire. In 1918-19, he served with Herbert Hoover in European relief work. In the latter year, he was named first Envoy Extraordinary

and Minister Plenipotentiary to Poland. He published *A Journal from Our Legation in Belgium* (1917).

GIDE, ANDRÉ (1869-). One of the leading French writers of the twentieth century, born in Paris and educated in the Parisian lycées. He began publishing in his twenty-first year. When he wrote his *Nourritures Terrestres*, a collection of prose poems, he had already reached his prime and was seen by his generation to be an intellectual poet of the first order. As a novelist and an intellectual essayist, Gide showed himself a master of psychological observation. In many ways he resembled Dostoyevsky and revealed, like the Russian, an over-anxious soul groping its way. This is perhaps accounted for by his Protestant environment, which made him stand midway between the religious assurance of Catholicism and the anticlerical assurance of French rationalism. Gide, in fact, pushed his Protestantism as far as Nietzscheanism, without however abandoning his moral preoccupations. After the War, Gide was among the first to demand the resumption of intellectual relations with Germany and engaged in a polemic against nationalistic writers like Barrès and Maurras. His works include: *Philoctète* (1890); *Cahiers d'André Walter* (1891); *Poésies d'André Walter* (1892); *Le Voyage d'Urien* (1893); *Paludes* (1895); *Prétextes* (1895); *Les Nourritures Terrestres* (1897); *Saul* (1898), played at the Théâtre du Vieux Colomblin in Paris (1922); *Le Roi Candau* (1898); *Le Traité de Narcisse* (1899); *Prométhée Mal Enchaîné* (1899); *Lettres à Angèle* (1900); *L'Immoraliste* (1903); *Amyntas*; *Le Retour de l'Enfant Prodigue*; *La Porte Etroite*; *Les Caves du Vatican*; *Isabelle* (1912); *L'Offrande Lyrique*, translated from Rabindranath Tagore; *Dostoyevsky*; *Journal d'Alissa*; *Oscar Wilde*; *La Symphonie Pastorale* (1920); *La Tentative Amoureuse* (1921); and *Morceaux Choisis* (1922). *La Porte Etroite* was translated into English under the title *Straight Is the Gate* (1924).

GIDE, CHARLES (1847-). A French economist, born at Uzès, and educated in law at the University of Paris. He taught at the Collège de France. An independent thinker on economic questions, Gide stimulated interest in economics as an art of social administration rather than as a science of the status quo. His *Histoire des Doctrines Economiques* (1909-22) contains a penetrating criticism of the communist experiment in Russia. He takes the social ideal for granted but emphasizes the painful slowness with which it must be approached. His other works include a treatise, *Principes d'Economie Politique*, which went through 23 editions in 40 years (1883-1923); lectures on the history of the coöperatives, *La Coopération* (1900); *Les Institutions de Progrès Social*, 4th ed. (1920); and *Premières Notions d'Economie Politique* (1921).

GIESE, WILHELM OSKAR FRITZ (1880-). A psychologist and author. He studied philosophy, psychology, and medicine and is connected with a sanitarium near Halle. Among his principal recent works are *Kulturkunde* (1916), *Der Romantische Charakter* (1919), *Psychologisches Wörterbuch* (1920), *Psychologische Normung* (1920), and *Wesen und Ziele der Psycho-technik* (1920).

GILBERT, ARTHUR WITTER (1882-). An American agronomist, born at West Brookfield, Mass., and educated at the Massachusetts

Agricultural College and Boston University. From 1903 to 1907 he was instructor and assistant professor of agronomy at the University of Maine, and from 1910 to 1911, assistant professor of plant breeding at Cornell, where he became a full professor in 1911. From 1917 to 1919 Professor Gilbert was agricultural secretary to the Boston Chamber of Commerce, and Commissioner of Agriculture of Massachusetts from the latter date. He was a member of many agricultural societies and the author of *Plant Breeding*, with L. H. Bailey (1914), and *The Potato* (1917). During the War he was secretary of the Federal milk commission.

GILBERT AND ELLICE ISLANDS COLONY. See PACIFIC OCEAN ISLANDS.

GILBRETH, FRANK BUNKER (1868-1924). An American consulting engineer (see VOL. IX). In July, 1917, he became commanding major of engineers, and in December of the same year was on duty at the General Staff College in Washington. Among his later writings are *Applied Motion Study* (1917), *Motion Study for the Handicapped* (1919), and papers on the reeducation of the crippled soldiers.

GILDERSLEEVE, BASIL L. See PHILOLOGY, CLASSICAL.

GILES, HERBERT ALLEN (1845-). An English Orientalist (see VOL. IX). Among his later works are "China" in *History of the Nations* (1913); *Adversaria Sinica* (1914-15); *Confucianism and Its Rivals* (1915); *How to Begin Chinese: the Hundred Best Characters* (1919); *The Second Hundred Best Characters*; and *Revision of Bullock's Progressive Exercises* (1922).

GILLETT, FREDERIC HUNTINGTON (1851-). An American Congressman, born at Westfield, Mass., and educated at Amherst College and the Harvard Law School. He began the practice of law in Springfield in 1877. He was Assistant Attorney General of Massachusetts, 1879-82. For two terms he was representative in the Massachusetts House, and in 1893 became a member of the National Congress, where he served continuously from the Fifty-third Congress. In 1914 he favored the Panama Canal Tolls Repeal Bill and was distinctly opposed to the government's Mexican policy. In May, 1919, he was elected Speaker of the House in place of Champ Clark and in 1920 was a delegate-at-large to the Republican national convention. Speaker Gillett favored the World Court and in spite of his 72 years was still a representative of remarkable physical and mental vigor at the Sixty-eighth Congress.

GILLOUIN, RENÉ C. G. (1881-). A French philosophical writer. He was born at Aouste, Drôme, and was educated at the Ecole Normale Supérieure. He entered the municipal administration of Paris and was attached to the cabinet of the president of the city council. As a writer his affinities were with the nationalist Catholic school and the ideology of Bergson and LeRoy. Three of his works received the prizes of the French Academy for literature and criticism. His writings include *Ars et Vita*, *Etudes Littéraires et Philosophiques*, *La Philosophie de M. Henri Bergson*, *Idees et Figures d'aujourd'hui*, and *Une Nouvelle Philosophie de l'Histoire Moderne et Française*.

GILSON, ETIENNE HENRY (1884-). A French professor and philosophical writer, born in Paris, and educated at the Sorbonne. He taught in the lycées of Bourges, Tours, and Angers, and in the universities of Lisle, Stras-

bourg, and Paris. As a scholar, Gilson was best known by his researches in mediæval philosophy. His writings include a doctoral dissertation on *La Liberté chez Descartes et la Théologie* (1912); *Etudes de Philosophie médiævale* (1921); *La Philosophie au Moyen Age*, 2 vols. (1922); *Le Thomisme* (1923); and *La Philosophie de Saint Bonaventure* (in preparation, 1924).

GINZKEY, FRANZ KARL (1871-). An Austrian author, born at Pola in Istria, and educated at the Marine Academy and Cadet School. After serving as officer in various Austrian towns, he was appointed technical director of the Military-Geographical Institute in Vienna. Later he went to Salzburg and devoted himself to writing. His works include *Ergebnisse*, poems (1901); *Hatschi-Bratschis Luftball*, 4th ed. (1905); *Jakobus und die Frau*, a novel (1908); *Geschichte emer Stillen Frau*, a novel (1909); *Balladen und Neue Lieder* (1910); *Der Wiesenzaun*, a story (1913); *Die Front im Tirol* (1916); *Der Gaukler von Bologna*, a novel (1917); *Befreite Stunde* (1918); *Der Doppelspiegel*, a story (1920); and *Die Einzige Sunde*, a story (1920). In 1906 he was awarded the Bauernfeld Prize. He was elected president of the Authors' Union of Austria.

GIOLITTI, GIOVANNI (1843-). An Italian statesman (see VOL. IX). When the War broke out he was in favor of a strict neutrality. When the question of Italian participation arose in 1915, he attempted to overthrow the Salandra cabinet, but his effort was swept aside by the patriotic zeal of the Italian masses for war. Throughout the course of the War he was looked on as a "defeatist." After the Armistice he again returned to the premiership (May, 1920), largely because of the unsatisfactory régime of Premier Nitti. His stay in power was comparatively short (April, 1921) and was marked by a successful foreign policy but an internal programme which was dominated first by the Socialists and later by the Fascists. See ITALY, *History*.

GIRAUDOUX, JEAN (1882-). A French man of letters, educated at the Ecole Normale. Following his graduation he devoted himself in turn to teaching, journalism, and diplomacy. In the meantime he began his literary career as a writer of poems in prose. His first book, *Les Provinciales* (1909), won immediate recognition. His war book, *Lectures pour une Ombre*, is one of the few war books of literary merit. In 1922 his *Siegfried et le Limousin* (1922), a war story of shell shock and amnesia, was one of the books awarded the Grand Prix Balzac. His works include *Simon le Pathétique*; *Amica America*; *Elpénor*; *Adorable Cléo* (1920); *Suzanne et le Pacifique* (1921); and *Finale de Siegfried et le Limousin* (1922).

GIRL SCOUTS. A national organization founded in 1912, which emphasizes methods of training to develop in girls initiative, self-control, self-reliance, and service to others. In the War, Girl Scouts sold, in the third Liberty Loan campaign, 12,742 bonds, amounting to \$3,151,000. No records were kept of their activities in the first two loan campaigns, but in the fourth loan they practically doubled their third loan figure, when they sold \$6,123,550 worth, or 39,987 bonds. The government awarded 1201 medals to Girl Scouts for selling 10 or more bonds to as many different people, simply

in the fourth loan. Many other forms of war service were entered into and initiated by them. The War over, they readily turned to peacetime activities. Home-making, with the idea of developing beauty and simplicity as well as utility in the home, and teaching Girl Scouts to make the best American homes of to-morrow, is increasingly emphasized. From the date of foundation (1912) to 1924, 497,208 girls had the benefits of Scout training.

GISH, DOROTHY (1898-). An American motion picture actress, born in Dayton, Ohio, sister of Lillian Gish. She appeared on the stage from childhood. Her best known pictures are *Old Heidelberg*, *Stage Struck*, *The Little Yankee*, *Children of the Feud*, *That Colby Girl*, *Hearts of the World*, *Battling Jane*, *The Hope Chest*, and *Orphans of the Storm*. In 1920 she married James Rennie, an actor.

GISH, LILLIAN (1896-). An American motion picture actress, sister of Dorothy Gish. She appeared on the legitimate stage at the age of five and after 1913 played in motion pictures. Her best characterizations were in *The Birth of a Nation*, *A House Built on the Sand*, *Souls Triumphant*, *Hearts of the World*, *The Greatest Thing in Life*, *Broken Blossoms*, *Way Down East*, *Orphans of the Storm*, and *The White Sister*.

GLACIAL CONDITIONS. See GEOLOGY.

GLACKENS, WILLIAM J. (1870-). An American painter and illustrator (see Vol. X). At the Panama-Pacific International Exposition, 1915, he was awarded a bronze medal. In his later work, continuing his interest in the more colorful aspects of life, he maintained his reputation as a remarkable colorist.

GLAND. See SECRETIONS, INTERNAL; ZOÖLOGY, Physiology.

GLASPELL, SUSAN (MRS. GEORGE CRAM COOK) (1882-). An American author (see Vol. X). She wrote *Fidelity* (1915); *Trifles*, with George Cram Cook (1917); *Suppressed Desires* (1917); *Plays*, a collection including *Bernice* (1920); *Inheritors* (1921); and *Verge* (1922).

GLASS, CARTER (1858-). An American politician and Congressman, born at Lynchburg, Va., and educated at public and private schools there. For eight years he worked in a printing office and subsequently became owner of the *Daily News* and the *Daily Advance* of his native town. He served in the Virginia Senate from 1899 to 1903, and in the latter year, on the death of P. J. Olney, he became a member of the United States Congress, to which he was continuously reelected until 1918, when he resigned to become Secretary of the Treasury in President Wilson's cabinet. Here he was active in floating the Victory Loan. He resigned a year later (November, 1919), and was appointed and later elected to fill the unexpired term of Senator Thomas S. Martin, deceased. In 1920 he was chairman of the committee on resolutions at the Democratic national convention. As chairman of the House banking commission he sponsored and was largely responsible for the Federal Reserve Act. In 1923 he favored the recall of the American troops from Germany and in March of the same year was appointed a member of the debt funding commission but declined to serve.

GLASS, MONTAGUE (MARSDEN) (1877-). An American author, born at Manchester, England, and educated at the College of the City

of New York and New York University. Among other works he is the author of *Potash and Perlmutter* (1913), a successful farce, written in collaboration with Charles Klein. With Goodman (q.v.) he wrote: *Object. Matrimony* (1916); *Business before Pleasure* (1917); *Why Worry?* (1918); *His Honor Abe Potash* (1919).

GLEAVES, ALBERT (1858-). An American naval officer, born in Nashville, Tenn., and educated at the United States Naval Academy. He was commissioned ensign in 1881. He served on many stations and during the Spanish-American War commanded the torpedo boat *Cushing*. From 1901 to 1904 he commanded the *Dolphin* and *Mayflower* in special service, and from 1904 to 1908 he was in charge of the torpedo station at Newport, R. I. He did shore duty and was in command of several vessels until 1915, when he was placed in command of the destroyer force of the Atlantic fleet. In 1917 he had charge of convoy operations on the Atlantic and convoyed the first force of the American Expeditionary Force to France. From 1917 to 1919 he commanded the cruiser and transport force of the Atlantic fleet, and from 1919 to 1921 commanded the Asiatic station, and in 1922 the First Naval District and the Navy Yard in Boston. He was retired by operation of law in 1922. He was appointed rear-admiral in 1915, vice-admiral in 1918, and admiral in 1919. He wrote *Capt. James Lawrence, U. S. N.* (1904) and *History of the Cruiser and Transport Force* (1921).

GLENN, MARY WILLCOX (MRS. JOHN M. GLENN) (1869-). An American social worker, born in Baltimore, Md. For several years she taught in private schools and from 1897 to 1900 was executive secretary of the Henry Watson Children's Aid Society of Baltimore. In 1900 and 1901 she served as general secretary of the Charity Organizations Society of Baltimore and in 1915 was appointed president of the National Conference of Charities and Corrections. She was president and director in many other social organizations and was the author of *Development of Thrift* (1899).

GLENN, OLIVER EDMUNDS (1878-). An American mathematician and educator, born in Moorefield, Ind., and educated at Indiana and Pennsylvania universities. In 1902-03 he served as instructor at the University of Indiana and afterward was acting professor of mathematics at Drury College. In 1906 he was a member of the faculty of the University of Pennsylvania as instructor in mathematics, assistant professor, and after 1914, professor. He was a member of several scientific societies and the author of *A Treatise on the Theory of Invariants* (1915) and mathematical memoirs.

GLOVES. See LEATHER.

GLYCEROL. See CHEMISTRY, ORGANIC.

GOBLOT, EDMOND (1858-). A French logician and philosopher of science. In his *Essai sur la Classification des Sciences* (1898) he sought to continue the tradition of positive rationalism inherited from Comte and Cournot. This project he carried out more fully in his later works, his *Traité de Logique* (1918) and *Le Système des Sciences: le Vrai, l'Intelligible, et le Réel* (1922). The rationalism expounded in these works is in direct contrast to the tendency of the school of Bergson toward

æsthetic mysticism. Goblot is also the author of a *Vocabulaire Philosophique* (1901).

GODDARD, HENRY HERBERT (1868-). An American psychologist known for his research in feeble-mindedness. He was born in Vassalboro, Me., and educated at Haverford College. After a period of school teaching, he was appointed professor of psychology at the State Normal School of Pennsylvania. In 1906 he resigned to take charge of the bureau of research in the Training School for the Feeble-minded at Vineland, N. J. After 12 years in this capacity he was made director of the State Bureau of Juvenile Research, of Ohio. His major publications comprise *The Kallikak Family* (1912); *Feeble-mindedness: Its Causes and Consequences* (1914); *The Criminal Imbecile* (1915); *Psychology of the Normal and Subnormal* (1919); *Human Efficiency* (1920); and *Juvenile Delinquency* (1921).

GODFREY, HOLLIS (1874-), An American educator and engineer, born in Lynn, Mass., and educated at Tufts College and Harvard University. From 1898 to 1905 he was engaged in teaching and from 1906 to 1910 was head of the department of science of the School of Practical Arts in Boston. He was consulting engineer for several cities and corporations and was research worker for the New York State Commission on Hygiene from 1910 to 1917. He was president of the Drexel Institute in Philadelphia from 1913 to 1921, and after 1921 was chancellor and senior fellow of the Institute of Management. He wrote *The Man Who Ended War* (1908); *The Health of the City* (1910); and *Dave Morrell's Battery* (1912), as well as contributions to periodicals.

GOETHALS, GEORGE WASHINGTON (1858-). An American civil and military engineer (see VOL. XI). He resigned from the post of Governor of the Canal Zone in 1916 and was made chairman of the board of inquiry in regard to the Adamson eight-hour law. He was State engineer of New Jersey in 1917 and in the same year was made manager of the Emergency Fleet Corporation. Because of his lack of faith in the wooden fleet he resigned after three months and was appointed acting quartermaster-general of the United States Army. In 1918 he was made chief of the division of purchase, storage, and traffic, and was also a member of the War Industries Board. At his own request, he was relieved from active service in 1919, and later headed an engineering and construction company.

GOITRE. Examination of United States recruits during the War showed a considerable percentage of cases of this affection. In one group of 20,000 no less than 6 per cent showed simple goitre in a considerable degree. It also became evident that this affection was endemic in certain areas, such as the belt which runs south of the Great Lakes. It is here that most of the intensive study and attempts at prevention have taken place. Thus in the school children of Akron, Ohio, goitre is known to develop in a considerable number, and it was learned that addition of a few milligrams of iodine to the daily diet was a certain preventive. At Rochester, N. Y., the city water supply was medicated with iodine with the desired result of preventing the development of the disease.

As far as the United States and Great Britain are concerned, simple goitre may be regarded as the most readily prevented of all diseases.

The problem is more complicated in France, Switzerland, and India, where the disease has been endemic for centuries with a high incidence. Here other factors may be at work in determining the disease, and the mere addition of a little iodine to the food or water may be insufficient for prevention. The iodine ingested by the patient may not be absorbed as a result of an abnormal condition of the intestine. Similarly there may be some irregularity in regard to the metabolism of iodine, or it may be too rapidly eliminated. The preventive action of iodine has, however, been demonstrated in school children in Switzerland, and it has been shown likewise that regions of high altitudes, remote from the ocean, may not contain enough iodine in their plant foods and water to prevent the development of the disease. Simple goitre must not be confused with toxic goitre or Graves's disease. In this form there is not much enlargement of the thyroid, but the patient is an invalid who suffers much from rapid pulse and nervousness. See FOOD AND NUTRITION.

GOLD. The War, with its extension economic changes and dislocation of values, produced a depression in the gold mining industry from which, after 1921, mining interests sought to emerge. Naturally, on account of the world exchange situation, certain mines, such as those in South Africa and Australia, were able to produce gold with considerable advantage, as they received a virtual premium on their output; but with the strengthening of sterling exchange they were placed in a worse position. In the United States there was no such advantage, and with the increased costs of labor and materials the mining of gold was not attended by attractive profits, so that in November, 1922, payment of a bounty on gold mining for three years was even advocated; another measure proposed a bounty to be raised by an excise tax on gold used in the arts. In the United States few new

PRODUCTION OF GOLD IN THE UNITED STATES CALENDAR YEARS 1910-23

Calendar years	Fine-ounces	Value
1910	4,657,017	96,269,100
1911	4,687,053	96,890,000
1912	4,520,719	93,451,500
1913	4,299,784	88,884,400
1914	4,572,976	94,531,800
1915	4,887,604	101,035,700
1916	4,479,057	92,590,300
1917	4,051,440	83,750,700

1923	2,485,445	51,378,700

fields were developed between 1914 and 1924, but with improved processes older mines had been reopened, and with increased production of copper, lead, and zinc, the gold and silver obtained as a by-product was more and more looked on as a source of profit. In 1915 the United States produced gold valued at \$101,035,700, or 21.5 per cent of the world's highest production, namely, \$468,799,812; but its quota had continually decreased until, notwithstanding an increase in 1923, it was but 14 per cent (\$51,378,700), or but slightly more than half of the record production of 1915. This reduced output also was accompanied by a discouraging outlook for the future as the returns from the various States showed that there had been a

considerable decline in production where the gold was obtained from siliceous ores and gravels, while the increases had come where the gold was obtained from refining the base metals, copper and lead, where production had greatly increased and metallurgical processes were constantly being improved. Thus while Arizona, Utah, Nevada, Idaho, Montana, Washington, and New Mexico all showed increased production in 1923, California, Alaska, South Dakota, Colorado, and Oregon all had a diminished output. In the United States the purchasing power of the gold dollar was shrinking, and at the same time large importations of gold were being made. This increased the gold reserves of the United States and added to the considerations which naturally would lead to low interest rates, to high prices, and in mining to higher costs. The accompanying table shows the production of gold in the United States in 1923 by States

UNITED STATES REFINERY PRODUCTION OF
GOLD FOR 1923
FIGURES COMPILED BY THE BUREAU OF THE
MINT, WITH THE COÖPERATION OF THE
UNITED STATES

State	Ounces	Gold	Value
Alaska	309,653		\$6,401,100
Alabama	5		100
Arizona	292,654		6,049,700
California	635,051		13,511,100
Colorado	314,495		6,501,200
Georgia	19		400
Idaho	36,305		750 500
Montana	85,121		1,759 600
Nevada	195,227		4,035,700
New Mexico	23,563		487,100
North Carolina	53		1,100
Oregon	23,085		477 200
Pennsylvania	111		2,300
South Carolina	15		300
South Dakota	308,984		6,283,900
Tennessee	319		6,600
Texas	44		900
Utah	137,567		3,257,300
Washington	15,335		317,000
Wyoming	10		200
Philippine Islands	72,824		1,505,400
Porto Rico	5		100
Totals	2,485,445		\$51 378 700

During the latter part of the period 1914 to 1924, and particularly during 1924, gold mining in the United States suffered on account of the high cost of labor and supplies, which were probably about 60 per cent higher than in 1913, while the price of gold naturally remained fixed at \$20.67 an ounce. Furthermore the mine operators of the United States were not able to pay for labor and supplies in a depreciated currency as in other countries but on a gold basis. In 1922 the United States consumed in the industrial arts gold to the amount of \$59,806 052, of which \$36,697,980 was new material, while \$48,849,096 represented the total production for the year. Gold was similarly used in other countries so that the total amount thus consumed was estimated as slightly in excess of \$100,000,000. When gold was used for cheap jewelry, for gilding, and like purposes, it obviously could not be recovered, so that the world's supply correspondingly was depleted.

In 1914 the United States exported some \$222,616,156 of gold and imported \$57,387,741, a balance of \$165,000,000 in excess of exports over imports. With the single exception of 1919, when the United States exported \$368,185,248

and imported \$76,534,046, the imports were in excess of the exports, because of the extremely heavy excess of merchandise exports over merchandise imports. In 1919 the United States had considerable balances due to neutrals, particularly in South America and Asia, and in that year there was a net outflow of gold, as shown in the table. On Mar. 18, 1922, the

UNITED STATES GOLD MOVEMENTS

	Imports	Exports
1913	\$63,704,832	\$91 798,610
1914	57,387,741	222,616,156
1915	451,954,590	31,125 18
1916	685,990 234	135,792 927
1917	552,454 374	371,884 884
1918	62,042,748	41 069 818
1919	76,534,046	368,185,248
1920	417,068,273	322 091,208
1921	691 267 448	23 891,377
1922	275,169 785	36 874,894
1923	322 716,812	28 643 417

Secretary of the Treasury announced that "the Treasury had resumed payments of gold service in the ordinary course of business without demand, and that the Federal Reserve Banks throughout the country would be guided by a similar policy in making current payments for gold account." This action removed the last artificial restriction on gold payments. The gold imported into the United States up to the close of 1921, and possibly for a short while afterward, was used to cancel indebtedness earlier incurred to Federal Reserve Banks by member banks. After that time the net gold imports were employed to build up the cash reserves of member banks with the reserve banks and to enable them approximately to increase the deposit liabilities of the member banks some tenfold without increasing their reliance on advances from the central banks. In January, 1923, the gold reserve in the United States was \$3,800,000 000, or nearly three times that of the British Empire and more than three times that of France.

PRODUCTION OF GOLD IN THE WORLD
CALENDAR YEARS 1910-22
BUREAU OF THE MINT

Calendar years	Fine ounces	Value
1910	22,022 180	\$453,289,100
1911	23,348,313	461,980,300
1912	22,549,335	466 136,100
1913	22,248,331	459,913,820
1914	21,244,880	439,170,642
1915	22,678,191	468,799 812
1916	21,974,839	454 260 242
1917	20,291,304	419 520 457
1918	18,363,157	383,734,482
1919	17,698,184	365,853,933
1920	16,303,306	337,001,255
1921	15,974 962	330,231,792
1922	15,440,243	319,178,164

The production of gold in Canada varied considerably. In 1911 it had fallen to \$9,781,077 for the entire Dominion, from which it increased to \$19,148,920 in 1921, and to \$26,116 050 in 1922. The Klondike's production, which in 1900 had been 1,077,533 ounces, by 1913 had declined to 282,838 ounces, and in 1922 this had further shrunk to 54,456 ounces. While there were no prospects of another Klondike in Canada, yet from time to time new deposits were encountered, and it was realized that there were substantial possibilities in other regions. For example, in 1923 the chief producers at Porcupine had a good year, and the same was true elsewhere in the province, Ontario producing

about \$21,000,000 in 1923. There the shortage of power was being met by new hydro-electric plants which were put in operation; others were in course of construction.

Mexico in 1910 reached a maximum gold production valued at \$25,100,000, from which it fell off to \$4,960,000 in 1915, increasing to \$16,705,000 in 1918, and about \$15,000,000 in 1922. The high cost of explosives was a serious item in view of the increased operating expenses; in Mexico, as in Germany, greater use was being made of liquid-oxygen explosives.

In South America, Colombia, which averages about 240,000 ounces a year, was the best gold producer during the decade 1914-24 and was followed by Brazil with an average of 125,000 ounces.

Russia and Siberia must be looked on as important future producers of gold, as the deposits there certainly warranted exploitation with proper government encouragement. Siberia in 1915 had a production valued at \$28,586,000, but due to the Revolution and changed conditions of government this had fallen to approximately \$1,000,000 in 1921 and to \$2,700,000 in 1922. The Transvaal, which had a maximum output in 1916 valued at £30,484,934, had only £34,488,250 in 1921. In 1922, due to the strike and civil war, the production was but £29,835,000. One significant feature of mining operations in the Transvaal was the decreasing production cost, which it was thought would be lowered still more with the consummation of a policy of consolidating some of the smaller properties. Increased labor efficiency was also the rule, and with native colored labor more largely employed and made more efficient, it was believed that properties once considered of too low a grade could be worked at a profit and the life of the gold fields extended.

GOLD COAST. A British colony of West Africa which includes within its administrative area Ashanti and the protectorate of the Northern Territories. Total area, 80,000 square miles; population, census of 1911, 1,503,386; increased by 1921 to 2,078,043. In 1915 there were 2206 Europeans, and in 1921, 2939. Chief towns are Accra (38,000), Seccondee (10,000), and Cape Coast Castle (15,000). Education, encouraged by the government and foreign missions, made great strides. There were 20 government schools and 214 government-aided schools with an attendance of 31,089 in 1921. The staple products and exports remained cocoa, palm oil, kola nuts, palm kernels, india rubber, and manganese. Exports in 1913, 1920, and 1922 were valued at £5,427,106, £12,352,207, and £8,335,400. Imports for the same years were £4,952,494, £15,152,145, and £7,900,539. That the gains were due to inflated values may be seen from the shipping record over the period, for the total tonnage entered and cleared was 2,986,000 (1913), 2,358,254 (1920), and 2,509,000 (1921). Chief imports in 1921 were cotton goods, machinery, provisions, apparel, hardware, and building materials. The growing importance of the United States in the Gold Coast foreign trade may be gauged from the following: imports for 1921 from United Kingdom, £5,828,000; from the United States, £965,000; exports to the United Kingdom, £3,216,000; to the United States, £1,031,000. Cocoa, the chief source of the economic well-being of the native population, continued to gain steadily. Exports in 1913 were 50,554 tons; in 1922,

159,305 tons. Gold, the leading product of the Ashanti, declined. In 1912 the production was 352,957 ounces; in 1921, only 85,019. The output of manganese ore in 1922 was valued at £106,031. Government accounts for 1913, 1920, and 1921-22 showed in revenues and expenditures £1,301,566 and £1,353,201. £3,721,772 and £2,856,347; £3,016,520 and £3,285,290. Railroad building continued; a line was completed from Accra to Anyinam (85 miles), and an extension was under way from this line to Coomassie in 1923. During the War the Gold Coast regiment aided in the reduction of German Togoland, where administration was conducted by British Gold Coast officials until the surrender of the territory to the French in 1919 under a League of Nations mandate.

GOLDEN, JOHN (1874-). An American playwright and producer, born in New York City. He played in stock and repertoire and was successively comic journalist, student of music, and song writer. He has composed more than 1000 songs, written many short plays, and designed scenery and costumes and composed the music for about a dozen musical comedies. His best known serious song is *Poor Butterfly*. The best plays with which he has been identified include *Turn to the Right Lightnin'*, *Three Wise Fools*, *Thunder*, *Dear Me*, *The First Year*, *The Wheel*, *Spite Corner*, and *Thank U*. Of a number of big shows at the Hippodrome his best were *Hip-Hip Hooray*, *Cheer Up*, and *Everything* (1918-19).

GOLDFARB, ABRAHAM J. (1881-). An American zoölogist, born in London, England, and educated at the College of the City of New York and Columbia University. He was tutor in biology (1910-11), instructor in natural history (1911-13), and assistant professor (1913-) at the College of the City of New York. He published articles on experimental zoölogy and embryology.

GOLDMAN, EMMA (1869-). An American anarchist (see Vol. X). She was arrested and deported to Russia in 1919. In 1920 she was reported to have said that she wanted to come back to the United States, but she was not allowed to return. On promising to abstain from propaganda, she was allowed to live in Germany, but in 1924 she held a protest meeting in Berlin, in behalf of the non-Communist revolutionaries in Russia, which was broken up by the police.

GOLDSMITH, ROBERT (1882-). An American writer and lecturer, born at Kingston, N. Y., and educated at Phillips Academy in Andover, Mass. In 1907-08, he engaged in publishing, and at intervals from 1909 to 1916 he was active in the Congregational ministry. His last pastorate was that of the Mapleton Park Congregational Church in Brooklyn, N. Y. From 1916 on, he held editorial or administrative positions with the Russell Sage Foundation, the League to Enforce Peace, the Rockefeller Foundation, the Interchurch World Movement, the New York World, the Bureau of Political Research, and the Democratic national committee. He is the author of *A League to Enforce Peace* (1917).

GOLDWYN, SAMUEL (1882-). An American motion picture producer born in Warsaw, Poland. He organized the Jesse Lasky Feature Photoplay Company, the Goldwyn Pictures Corporation, the Eminent Authors' Pictures, Inc., and the Madison Productions, Inc.,

and was a pioneer in inducing American authors to work actively for the motion pictures. Among the stars he introduced to the screen were Mary Garden, Pauline Frederick, and Geraldine Farrar. He has published a volume of reminiscences.

GOLF. The galleries at golf matches are small compared with the throngs which assemble for professional baseball games or college football games in the United States or a soccer cup-tie in the United Kingdom. The reason is simple. Everybody is intent on his own little golf match. In other words, in so far as the Anglo-Saxon world is concerned, golf has more actual playing disciples than any other sport. Both sexes of all classes and all ages have joined in the stampede for the links; the biggest rush came in the decade ending with 1924. The "craze" has been more widespread in the United States than elsewhere and has led the larger municipalities to lay out courses in the public parks. The number of club links opened during recent years runs into the thousands. International competition, particularly between Great Britain and the United States, has been keen. In 1920 Edward Ray of England visited the United States and captured the national open championship, and in 1921 Jock Hutchison of the United States reciprocated by carrying off the British open title. In the following year Walter Hagen, also of the United States, won the British open championship. A. G. Havers succeeded in 1923 in regaining these laurels for England. In 1924 Walter Hagen again won the British open title. An American team successfully defended the Walker Cup, emblematic of the world's team championship, against English players in 1923. The winners of the more important United States championships during the period 1915-23 follow:

National open: 1915, Jerome D. Travers; 1916, Chick Evans, Jr.; 1917, Jock Hutchison; 1918, no match; 1919, Walter C. Hagen; 1920, Edward Ray (England); 1921, James Barnes; 1922, Gene Sarazen; 1923, Robert T. Jones, Jr.

National amateur: 1915, Robert A. Gardner; 1916, Chick Evans, Jr.; 1917, no match; 1918, no match; 1919, S. D. Herron; 1920, Chick Evans, Jr.; 1921, Thomas Guilford; 1922, Jesse Sweetser; 1923, Max R. Marston.

National women's amateur: 1915, Mrs. C. H. Vanderbeck; 1916, Alexa Stirling; 1917, no match; 1918, no match; 1919, Alexa Stirling; 1920, Alexa Stirling; 1921, Marion Hollins; 1922, Glenna Collett; 1923, Edith Cummings.

The holders of the principal British titles have been.

Open: 1915-19, no matches; 1920, George Duncan; 1921, Jock Hutchison (United States); 1922, Walter C. Hagen (United States); 1923, A. G. Havers; 1924, Walter C. Hagen.

Amateur: 1915-19, no matches; 1920, Cyril Tolley; 1921, W. Hunter; 1922, E. W. Holderness; 1923, Roger Wethered.

Women's: 1915-19, no matches; 1920, Cecil Leitch; 1921, Cecil Leitch; 1922, Joyce Wethered; 1923, Miss Chambers.

GOLLANCZ, ISRAEL (1864-). An English scholar (see VOL. X). He became a corresponding member of the Royal Spanish Academy (1919) and visited the United States in 1923. One of his later works was the *Book of Homage to Shakespeare* (1916).

GOMEZ, JUAN VICENTE (1859-). A Venezuelan politician (see VOL. X). In 1913

ex-President Castro attempted to regain his power in Venezuela, and on August 3, President Gomez left the capital to restore public order. On Jan. 1, 1914, he returned to Caracas with his army and resumed the presidency. His term ended on Apr. 19, 1914, and on that day the Venezuelan Congress elected him commander-in-chief of the national army. On May 3, 1915, he was chosen president for the term ending Apr. 19, 1922. He did not take office but remained commander of the army. On May 3, 1922, he was again elected president for the term 1922-29.

GOMPERS, SAMUEL (1850-1924). An American labor leader (see VOL. X). On the entrance of the United States into the War, he was appointed a member of the Advisory Commission of the Council of National Defense (1917-19); and in 1918-19, he was a representative of the American Federation of Labor at the Paris Peace Conference. He was president of the international commission on labor legislation at the peace congress; chairman of the delegates from the American Federation of Labor to the convention of the International Federation of Trades Unions at Amsterdam (1919); a member of the President's first industrial conference (1919), of the President's unemployment conference (1921), and of the President's advisory disarmament commission (1921-). In addition, he has held the presidency of the Pan-American Federation of Labor and was a member of the Sulgrave Institute. In 1921 he was elected president of the American Federation of Labor for the fortieth time. Gompers is an antisocialist and for that reason opposed the United States' recognizing Russia.

GONADS. See SECRECTIONS, INTERNAL.

GONZIA AND GRADISCA. See FIUME-ADRIATIC CONTROVERSY.

GOODALE, HUBERT DANA (1879-). An American zoologist, born at Troy, N. Y., and educated at Trinity College, in Connecticut, and Columbia University. He was resident investigator at the Station for Experimental Evolution, Cold Spring Harbor, N. Y. (1911-13) and research biologist in poultry husbandry at the Massachusetts Experiment Station (1913-). Professor Goodale's publications have been on heredity, mainly in connection with domestic fowl.

GOODMAN, JULES ECKERT (1876-). An American dramatist, born in Gervais, Ore., and educated at Harvard and Columbia Universities. He was prominent in magazine work for years as managing editor of *Current Literature* and with the *Dramatic Mirror* and *Outing*. His writings include, in collaboration with Montague Glass, *The Man Who Came Back* (1916); *Object: Matrimony* (1916), *Business before Pleasure* (1917); *Why Worry?* (1918), *His Honor Abe Potash* (1919). He also wrote *The Silent Voice* (1914) and *Pietro* (1919), in both of which Otis Skinner was starred; *The Dreamer* (1920); *The Law Breaker* (1921); *Charms* (1923).

GOODNOW, FRANK JOHNSON (1859-). An American educator and legal scholar (see VOL. X). In 1914 he was made president of Johns Hopkins University. He published *Principles of Constitutional Government* in 1916.

GOOSSENS, EUGENE (1893-). A British composer and conductor, born in London. He began his musical studies at the Conservatory in Bruges in 1903 and entered the Liver-

pool College of Music in 1906. In 1907 he won a scholarship at the Royal College of Music in London, where he spent the next four years under Rivarde (violin) and Stanford (composition). From 1911 to 1915 he was a violinist in the Queen's Hall Orchestra and appeared occasionally as conductor of his own works. In 1915 Beecham engaged him for his opera company, to conduct Stanford's *The Critic*; of this task the young man acquitted himself so successfully that he remained as regular conductor until the dissolution of the enterprise in 1920, when he was engaged by the British National Opera Company. In the meantime frequent appearances as guest conductor with several orchestras in the provinces and in London had established his reputation as one of the foremost of British conductors. In 1923 he appeared in the United States as guest conductor of the Rochester Philharmonic Orchestra for the first half of the season. As a composer he is very prolific and won recognition from the beginning. He is an uncompromising exponent of ultramodern tendencies. Among his works are two symphonic poems, *Perseus* and *The Eternal Rhythm*; *Symphonic Prelude* to a poem by Ossian; an orchestral scherzo, *Tam O'Shanter*; *Variations on a Chinese Theme* for orchestra; *Poem* for violin and orchestra; *Miniature Fantasy* for string orchestra; *Fantasy Sextet* for strings, commissioned for the Berkshire Festival, 1923; a great deal of chamber music; piano pieces and songs; and an overture and incidental music to Verhaeren's *Philip II*.

GORDON, CHARLES WILLIAM (1860-). A Canadian author (see VOL. X). In 1915 he was chaplain with the Canadian forces at the front. He has served on a special commission for the imperial government and the Canadian government in the United States (1917) and on a special commission for the Canadian government to Great Britain (1918) and was appointed chairman by the Council of Industry for the Province of Manitoba by the provincial government (1920). Among his later publications are *The Major* (1917), *The Sky Pilot in No Man's Land* (1919), and *To Him That Hath* (1921). He wrote under the name of "Ralph Connor."

GORDON, WALTER HENRY (1863-). An American army officer, born in Wilkinson county, Miss. He graduated from the United States Military Academy in 1886 and was commissioned second lieutenant in the same year. After serving in the Spanish-American War and with various regiments, he was appointed colonel of the 31st Infantry in 1916, and brigadier-general in the National Army in 1917. He served as commander of the 154th Depot Brigade at Camp Meade, Md., in 1917, and in the same year was transferred to the 10th Infantry Brigade, 5th Division, Camp Forrest, Ga. In 1918 he was appointed major-general commanding the 6th Division. He was honorably discharged and was appointed brigadier-general of the Regular Army in 1921. In 1918-19 he was on service in France and was with the Army of Occupation in Germany in 1919. In 1920 he was appointed commandant of the Infantry School at Camp Benning, Ga.

GOBE, CHARLES (1853-). An English theologian and prelate (see VOL. X). In 1919 he resigned his bishopric, and settling in London, identified himself with the Christian Socialists. Among his later works were *The*

Religion of the Church (1916); *The Epistle of St. John* (1920), *Christian Moral Principles* (1921), *Belief in God* (1921), *The Duty of Christ* (1922), and *Belief in Christ* (1923).

GOBEMÝKIN, IVAN LOGGINOVITCH (1839-1917). A Russian statesman (see VOL. X). After the Revolution he was arrested and confined for a short time in the Fortress of St. Peter and St. Paul. Together with his wife and brother-in-law, he was murdered in the Caucasus in the latter part of October, 1917.

GORIZIA. See WAR IN EUROPE, *Italian Front*.

GORKY, MAXIM (ALICEKÈ MAXIMOVITCH PÉSHKOV) (1863-). A Russian author (see VOL. X). His later works include *About the Devil*, *The Reader*, *Three Men*, *Comrades*, *My Childhood*, *In the World*, *Reminiscences of L. N. Tolstoy*, and *My University Days*. Throughout his works runs the same motive, the story of an inarticulate soul striving for expression.

GORMAN, JAMES EDWARD (1863-). An American railway official, born in Chicago. He began his railroad career with the Chicago, Burlington, and Quincy road, in 1877. He occupied important positions in several companies and was with the Atchison, Topeka, and Santa Fé in various capacities from 1895 to 1917. In the latter year he became president of the C. R. I. and P. R. R. and was Federal manager of this road from 1918 to 1920, when he again became its president.

GOSSE, EDMUND WILLIAM (1849-). An English poet, critic, and biographer (see VOL. X). He was chairman of the board of Scandinavian studies at University College in London (1917) and president of the English Association (1921). His later works include *Inter Arma* (1916), *The Life of Algernon Charles Swinburne* (1917), *Three French Moralists* (1918), *Diversions of a Man of Letters* (1919), *Malherbe* (1920), *Books on the Table* (1921), and *Aspects and Impressions* (1922).

GÖTZINGER, GUSTAV (1880-). A geologist at the Geological Institute, Vienna, born in Neu-Serowitz, Moravia, and educated at the Gymnasium and the University of Vienna. He became editor of the *Geographische Jahresbericht aus Österreich*. In 1903-05 and 1907-12 he was assistant at the geographical institute of the University of Vienna; in 1905, hydrographer and geographer of the biological station at Lunz; and in 1906-11 oceanographer of the Society for the Investigation of the Adriatic. In 1912 he was appointed section geologist of the Geological Institute at Vienna. He is the author of numerous works, dealing especially with glacial and marine geology. Some of these are *Exotische Blöcke Wienerwald* (1906); *Entstehung der Begrabenformen* (1907); *Lunzer Mittersee* (1908); *Eis der Lunzer Seen* (1909); *Oceanographische Beobachtungen Nordlicher Adria* (1910); *Geomorphologie der Lunzer Seen, Geologie und Morphologie Dinara, Morphologie des Ostlichen Kalkhochplateaus* (1912); *Gletschervermessung der Alpen* (1906); *Nordisches Diluvium West-Schlesiens* (1914, 1915); *Erzgebirge, Österreichische Alpenseeforschung* (1916); *Eis der Lunzer Seen* (1917); and *Phosphathöhle von Csaklovina* (1919).

GOUCHER COLLEGE. A nonsectarian college for women at Baltimore, Md., founded in 1885. Goucher showed a gain of approximately 165 per cent in the number of students enrolled

in the decade between 1913-14 and 1923-24, with 1024 registered at the end of that time as compared with 386 at the beginning. The faculty also increased, from 29 to 81, and the library from 12,000 to 40,000 volumes. The endowment fund, begun during this period, amounted to \$1,500,000 in 1924. A new site was bought in 1921 at Towson, Md., and a campaign inaugurated to collect \$6,000,000, of which \$5,000,000 was to be used to move the college from Baltimore to Towson. The remaining \$1,000,000 was to be added to the permanent endowment fund. To this latter fund the General Education Board in New York pledged \$400,000 in 1921 and paid an additional \$40,000 in cash. The Board gave \$250,000 to the endowment fund of the college in 1917. President, William Westley Guth, Ph.D., LL.D.

GOULD, EDWIN (1866-). An American railway official (see Vol. VIII). In 1917-18 he served with Squadron A, New York National Guard, and in the latter year was major of ordnance in the 1st Brigade of the New York guard.

GOURAUD, HENRI JOSEPH EUGÈNE (1867-). A French general, born at Paris, and trained at St. Cyr. He became lieutenant of infantry in 1880. He served in the Sudan in the 1890's. In 1904, promoted to the rank of lieutenant-colonel, he became commandant of the Congo territory. In 1914 he was temporary general of division and in 1915 commander of the colonial army corps. In the same year he was appointed substantive general of the division. Early in his life General Gouraud was made a chevalier of the Legion of Honor, in 1904 he became an officer, and in 1918 he received the Grand Cross of the Legion. In 1924 he was elected to the French Academy in the section of Archaeology and Belles Lettres. This was in recognition of his establishment, in the Near East, of a special archaeological and fine arts service, which helped in the excavations of Byblos, Tyre, and Sidon.

GOYAU, P. L. T. GEORGES (1869-). A French man of letters. He was born at Orléans and was educated at the Ecole Normale Supérieure and the Ecole Française de Rome. As one of the editors of the powerful *Revue des Deux Mondes* and of *Figaro* he wielded an influence in behalf of conservatism and Catholicism. His published writings reflect the social Catholic tradition of Joseph de Maistre. He was elected member of the French Academy in 1923. A partial list of his writings includes *Le Pape* (1893); *Le Vatican* (1895); *Autour du Catholicisme Social* (3 series: 1897, 1901, and 1907); *L'Allemagne Religieuse: Le Protestantisme* (1898); *L'Idée de Patrie et l'Humanitarisme* (1901); *Essai d'Histoire Française* (1901); *L'Allemagne Religieuse: le Catholicisme* (2 vols., 1905); *Le Cardinal Mercier* (1917); *La Pensée Religieuse de Joseph de Maistre* (1921); *Ste. Jeanne d'Arc* (1921); and *Histoire Religieuse de la Nation Française* (1922).

GRAFF, KASIMIR ROMUALD (1878-). A German astronomer, born at Prochnowo, Posen, and educated at the Gymnasium and at Friedrich-Wilhelm University in Berlin. In 1897 he was made assistant in astronomy at the university and in 1900 became a member of the board of directors of the Urania Observatory in Berlin. In 1909 he transferred to the Hamburg observatory, where he became a professor in

1917. He is the author of many astronomical articles in scientific periodicals and of the *Grundriss der Geographischen Ortsbestimmung* (1914); a German adaptation of Fabre, *Der Sternhimmel* (3d ed., 1921); an adaptation of Newcomb, *Astronomie für Jedermann* (4th ed., 1922); and *Astrophysik*, with Scheiner (1922).

GRATLY, CHARLES (1862-). An American sculptor (see Vol. X). In 1915 he served on the International Jury of Awards at the Panama-Pacific International Exposition. In 1917 he became instructor in the Boston Museum of Fine Arts. Among his awards during the period were the Potter Palmer gold medal, 1921.

GRAHAM, STEPHEN (1884-). An English writer on Russia (see Vol. X). In addition to a series of articles contributed to the *London Times*, his later works include *Russia and the World* (1915); *The Way of Martha and the Way of Mary* (1915); *Through Russian Central Asia* (1916); *Russia in 1916* (1917); *Priest of the Ideal* (1917); *Quest of the Face* (1918); *Private in the Guards* (1919); *Children of the Slaves* (1920); *The Challenge of the Dead* (1921); *Europe—Whither Bound?* (1921); *Tramping with a Poet in the Rockies* (1922), and *Under-London* (1923).

GRAHAME-WHITE, CLAUDE (1879-). An English aviator and writer (see Vol. X). Among his later books are *Learning to Fly* (1914); *Aircraft in the Great War* (1915); *Air Power* (1917); *Our First Airways, Their Organization, Equipment and Finance* (1918); *Books for Boys; Heroes of the Air; With the Airmen; The Air King's Treasure; The Invisible War-plane; Heroes of the Flying Corps*.

GRAIN. See AGRICULTURE; WHEAT.

GRAINGER, PERCY ALDRIDGE (1882-). A British composer and pianist, born at Brighton, Melbourne, Australia. He received his first instruction on the piano from his mother, continued with J. Kwast in Frankfurt (1894-1900), and was for a short time with Busoni. After a most successful début in London, in 1900, he toured Great Britain, New Zealand, Australia, and South Africa. Returning to Europe in 1906, he made tours of the continent until 1915, when he visited the United States and settled there permanently. He served in the American army during the War and was afterward naturalized. As a composer he became known first in 1912, when he conducted his *Mook Morris* at one of Gardiner's concerts in London. Almost without exception his compositions are based on folk music, of which he is not only a profound student but also an ardent collector; he has taken more than 500 records of folk melodies of all the countries he has visited. His choral works with orchestra include *Father and Daughter*, *Sir Eglamore*, *The Bride's Tragedy*, and *Marching Song of Democracy* (for the Worcester Festival, 1916). He has also written *In a Nutshell*, suite for piano and orchestra; for orchestra, *Molly on the Shore*, *English Dance*, *Colonial Song*, *Shepherd's Hey*; pieces for piano, and a few songs. Consult D. C. Parker's *P. A. Grainger: A Study* (New York, 1918).

GRAIN STANDARDS. See WHEAT.

GRAND RAPIDS. A city of Michigan, at the head of navigation on the Grand River. The population rose from 112,571 in 1910 to 137,634 in 1920, and to 145,947 by estimate of the Bureau of the Census for 1923. A new charter providing that the city be governed by

a commission of seven members and a city manager went into effect in 1916. In 1920, active city planning work was begun. Building permits increased from \$3,618,119 in 1914 to \$10,204,795 in 1923. During the period a municipal tuberculosis hospital costing \$805,000, a high school costing \$600,000, grade schools, a theatre costing \$750,000, hotels, churches, a Roman Catholic seminary, and an academy were built. Bank deposits increased from \$34,281,682 to \$63,671,929, and clearings from \$168,038,735 to \$334,335,000. Assessed valuation rose from \$100,842,216 to \$221,426,753.

GRÄNER, PAUL (1873-). A German composer, born in Berlin. After a varied career as operatic conductor in several German cities he went to London in 1896 as conductor at the Haymarket Theatre and taught several years at the Royal Academy of Music. From 1902 to 1909 he taught at the Neues Konservatorium in Vienna and from 1910 to 1913 was director of the Mozarteum at Salzburg. He then lived in Munich until 1920 and devoted himself chiefly to composition. In 1920 he accepted the professorship of composition at the Leipzig Conservatory, succeeding Reger. He is the originator of *Kammersusikdichtung*, employing the usual combinations of instruments heretofore used only in pure chamber music for the purpose of interpreting a literary programme, as Raabe's *Hungerpastor* by means of a piano trio, or *Schneid an das Meer* by means of a piano quintet. Among his other works are a symphony in D minor, a *Sinfonietta*, *Musik am Abend* for orchestra, and the operas *Das Narrengericht* (Vienna, 1913), *Don Juans Letztes Abenteuer* (Leipzig, 1914), *Theophano* (Munich, 1918), and *Schirin und Gertraude* (Dresden, 1920).—Consult G. Gräner's volume, *Paul Gräner* (Leipzig, 1922).

GRANT, PERCY STICKNEY (1860-1927). An American clergyman (see VOL. X). He continued, until 1924, as rector of the Church of the Ascension, New York City. Here he maintained a so-called Forum for free discussion, in which advocates of all political and social doctrines were permitted to speak freely. This was widely criticized and finally, in 1923, following action taken by Bishop Manning, the forum was greatly modified in its character. He also came in controversy with Bishop Manning on the question of divorce. He became engaged to a lady who had been divorced, and Bishop Manning refused to authorize the marriage, which did not take place. In June, 1924, he resigned his rectorship. His later books include *Fair Play for the Worker* (1918); *Essays and Poems* (1922); and *The Religion of Main Street* (1923).

GRAPHITE. Graphite is extensively consumed in the United States for various industrial purposes. The natural product, both in its crystalline and amorphous forms, entered into consumption, together with the manufactured product, which is made in the electric furnace. In addition to the native supply, the crystalline graphite used in the United States is produced in Ceylon, Madagascar, Japan, Austria, Bavaria, and Czecho-Slovakia as indicated in the accompanying table. It is used mostly in making crucibles and as the metallurgical activities of the War led to extensive mining, there was abnormal production which was gradually later being absorbed.

The crystalline product, in the form of lump,

DOMESTIC NATURAL GRAPHITE SOLD IN THE UNITED STATES, 1914-22

Year	Amorphous		Crystalline	
	Short tons	Value	Pounds	Value
1914	1,725	\$38,750	5,220,399	\$285,368
1915	1,181	12,358	7,074,870	417,273
1916	2,622	20,723	10,931,989	914,748
1917	8,301	73,481	10,584,080	1,094,398
1918	6,560	69,455	12,861,839	1,454,799
1919	3,379	47,716	8,086,191	731,141
1920	4,694	49,758	9,632,360	576,444
1921	1,842	20,860	1,189,523	75,664
1922	2,200		1,849,766	85,242

chip, or dust, comes mainly from Ceylon, while most of the imported crystalline flake comes from Madagascar and Canada. The amorphous graphite is used mainly for foundry facings and paint, and while some is mined in Rhode Island, the greater part is imported from Chosen (Korea) and Mexico. The sales of crystalline graphite in 1922 amounted to 1,849,776 pounds, valued at \$85,242, the average value per pound being \$0.046, or \$0.018 less than in the preceding year. The quantity of amorphous graphite sold was 2200 tons.

The imports into the United States were, in 1916, 86,033,920 pounds, valued at \$7,279,884, but they declined to 39,633,575 pounds, valued at \$480,961, in 1923. In 1900 artificial graphite was first manufactured on an extensive scale in the United States, when 860,750 pounds, valued at \$168,860, were produced. By 1914 this amount had been increased to 10,455,139 pounds, and to 13,012,000 pounds by 1922. In 1915 the manufacture of graphite started on a substantial scale in Canada with a production of 497,271 pounds, which by 1918 had increased to 1,808,698 pounds. Naturally such production was only possible where cheap water power was available.

GRASTY, CHARLES HENRY (1863-1924). An American journalist, born at Fincastle, Va., and educated at the University of Missouri and Washington and Lee University. He was managing editor of the *Kansas City Times* (1884-89); editor and proprietor of the *Baltimore Evening News* (1892-08); director of the Associated Press (1900-10); editor and controlling owner of the *St. Paul Dispatch* and the *Pioneer Press* (1908-09), and of the *Baltimore Sun* (1910-14); war correspondent for the Associated Press, *New York Times*, and *Kansas City Star* in Europe (1915); and treasurer of the *New York Times* (1916-20). During the War he was on the editorial staff of the *New York Times* (1916-21) and was widely recognized as an independent writer on war situations abroad. He died in London, in January, 1924.

GRAVES, CHARLES L. (1856-). An Irish author (see VOL. X). Among his later works are *War's Surprises* (1917), *Lands and Libels* (1918), *Mr. Punch's History of the Great War* (1919); *Horace's Odes, Book V*, an English version with Rudyard Kipling (1920), *New Times and Old Rhymes* (1921), *Punch's History of Modern England* (1921), etc.

GRAVES, FRANK PIERREPONT (1869-). An American educator, born in New York City, and educated at Columbia University. From 1891 to 1893, he was assistant professor of Greek, and immediately afterward, professor of classical philology in Tufts College. In 1896-98, he was president of the University of Wyoming; in 1898-1903, president of the University of Washington, and in 1904-21, pro-

fessor of education or dean in Missouri, Ohio, Wisconsin, Chicago, Pennsylvania, and Columbia Universities. In 1921 he became president of the University of the State of New York and Commissioner of Education. His publications include *Burial Customs of the Ancient Greeks* (1891); *The Philoctetes of Sophocles* (1893); *The State University Ideal* (1897); *A History of Education before the Middle Ages* (1909); *A History of Education during the Middle Ages and the Transition to Modern Times* (1910); *Great Educators of Three Centuries* (1911); *Peter Ramus and the Educational Reformation of the Sixteenth Century* (1912); *A History of Education in Modern Times* (1913); and *What Did Jesus Teach?* (1919).

GRAVES, HENRY SOLON (1871-). An American forester, born at Marietta, Ohio, and educated at Yale, Harvard, and the University of Munich. From 1900 to 1910 he was professor of forestry and director of the Forest School at Yale, and from the latter date to 1920, chief of the United States Forest Service. He was a member of many American and foreign societies and wrote *Forest Mensuration* (1906), and *Principles of Handling Woodlands* (1911). During the War he was lieutenant-colonel in the corps of engineers, serving in France. In 1920 he became consulting forester.

GRAVING DOCKS. See **DOCKS**.

GRAVITATION, IN LIGHT OF MODERN THEORY. See **PHYSICS**.

GRAY, ALEXANDER (1882-). An American engineer, born in Edinburgh, Scotland, and educated at Edinburgh and McGill Universities. Until 1904 he was engaged in engineering work in Edinburgh, and from 1910 to 1915 was assistant professor of electrical engineering at McGill University. In the latter year he became head of the electrical engineering department at Cornell. He was a member of several engineering and other societies and wrote *Electrical Machine Design* (1913) and *Principles and Practice of Electrical Engineering* (1914). He was also the author of a section of the *Standard Handbook for Electrical Engineers*.

GRAY, GEORGE (1840-1925). An American jurist and legislator (see **VOL. X**). He was appointed peace commissioner to Great Britain in 1915, and in the same year he was chairman of the United States delegation to the Pan-American Scientific Congress. President Wilson appointed him a member of the American-Mexican Commission in 1916.

GRAY, LOUIS H. (1875-). An American orientalist, (see **VOL. X**). He was associate editor of the Hastings *Encyclopædia of Religion and Ethics* (Edinburgh 1905-15), editor of *Mythology of all Races* (1915-18), and after 1921 professor at the University of Nebraska. He was one of the American commissioners to negotiate peace in Paris (1918) and attaché to the American embassy (1920).

GRAYSON, CARY TRAVERS (1878-). An American physician and rear-admiral, born at Culpepper County, Va., and educated at William and Mary College and the University of the South. In 1904 he graduated from the United States Naval Medical School. After service as assistant surgeon of the United States navy, he was appointed medical director, with the rank of rear admiral, in 1916. He was the personal physician of Presidents Roosevelt, Taft, and Wilson. During the War he was a member of many important commissions and was

also connected with the staff of several hospitals in Washington and elsewhere.

GRAZIE, MARIE EUGENIE DELLE (1864-). An Austrian poet, dramatist, and novelist, who was very prolific during the years 1914-24 (see **VOL. X**). She published *Das Buch des Lebens* and *Zwei Wittwen* (1914); *Die Blonde Frau Fina*, *Das Buch der Liebe*, *O Jugend!* and *Eines Lebens Stern* (1916); *Homo*, *Donaukind*, *Der Liebe und des Ruhmes Kranze*, and *Die Blume der Acacia* (1921), all fiction.

GREAT BRITAIN. The United Kingdom of Great Britain and Northern Ireland, and the Irish Free State. The former is a constitutional monarchy; the Irish Free State, a self-governing dominion. The capital of the United Kingdom is London, and Dublin is the capital of the Irish Free State. The term Great Britain is applicable literally to England, Scotland, and Wales; the term United Kingdom to Great Britain, Northern Ireland, the Isle of Man, and the Channel Islands; and the term British Isles to the United Kingdom and the Irish Free State. The United Kingdom with all of its possessions and dependencies, including the self-governing dominions, crown colonies, protectorates, mandates, and other territories subject to the control of Parliament, constitutes the British Empire (q.v.).

Area and Population. The total area of the British Isles is 121,633 square miles, of which 88,745 square miles make up Great Britain, 27,155 square miles the Irish Free State, 5431 square miles Northern Ireland, and 302 square miles the Isle of Man and the Channel Islands. The total population of the British Isles in 1921, exclusive of navy, army, and merchant seamen abroad, was 47,307,601, an increase of 1,937,071 over 1911. No census was taken in Ireland in 1921; so the 1911 figure was used in both years. The number of persons per square mile was, in 1911: England and Wales, 618.3; Scotland, 156.6; Northern Ireland, 230.3; Irish Free State, 115.6. In 1921 it was England and Wales, 649.4, Scotland, 160.6. During 1922 there were 780,187 births in England and Wales and 115,085 in Scotland; there were 486,829 deaths in England and Wales and 72,904 in Scotland. In 1921 there were 90,720 births in Ireland and 63,838 deaths. The population of Greater London was 7,476,168 in 1921 and 7,251,358 in 1911. The population of the Administrative County of London and City of London was 4,483,249 in 1921, as compared with 4,521,685 in 1911. The largest cities in the United Kingdom are:

			Per cent Increase or Decrease
ENGLAND			
London	4,521,685	4,483,249	- 0.9
Birmingham	840,202	919,438	+ 9.4
Liverpool	753,353	803,118	+ 6.5
Manchester	714,385	730,551	+ 2.3
Sheffield	460,183	490,724	+ 6.6
Leeds	454,155	458,320	+ 1.2
Bristol	357,114	377,061	+ 5.6
West Ham	289,030	300,905	+ 4.1
Kingston-upon-Hull	277,991	287,013	+ 3.2
Bradford	288,458	285,979	- 0.9
SCOTLAND			
Glasgow	784,496	1,034,069	+ 31.8
Edinburgh	320,318	420,281	+ 31.2

The following table shows the population of the British Isles in 1911 and 1921 divided according to sex.

	AREA	1911		POPULATION		1921	
Division	Square Miles	Males	Females	Total	Males	Females	Total
England	50,874	16,421,298	17,623,992	34,045,290	16,984,087	18,694,443	35,678,530
Wales	7,466	1,024,310	1,000,892	2,025,202	1,098,133	1,108,579	2,206,712
Scotland	30,405	2,308,839	2,452,065	4,760,904	2,348,403	2,533,885	4,882,288
Northern Ireland	5,431	602,539	647,992	1,250,531	* 602,539	* 647,992	* 1,250,531
Irish Free State	27,155	1,589,509	1,550,179	3,139,688	* 1,589,509	* 1,550,179	* 3,139,688
Isle of Man	227	23,937	28,079	52,016	27,321	32,917	60,238
Channel Islands	75	46,229	50,670	96,899	41,264	48,350	89,614
Total	121,633	22,016,661	23,353,869	45,370,530	22,691,256	24,616,345	47,307,601

* Irish Census of 1911

The total movement of travelers from the British Isles to non-European countries was 463,285 in 1923 and 701,691 in 1913, and the inward movement was 210,509 in 1923 and 372,618 in 1913. The 1923 figure included British subjects: 337,567 outward and 147,184 inward; alien subjects: 125,718 outward and 63,325 inward. In addition to the above, there were 12,653 outward passengers and 5642 inward passengers recorded at ports of the Irish Free State for the nine months from April to December, 1923, when that country had separated from the United Kingdom. In 1923, about 33 per cent passed through Liverpool, 32 per cent through Southampton, 16 per cent through London, and 12 per cent through Glasgow. Of the outward passengers, 182,758 went to the United States, 158,359 to British North America; 45,265 to Australia, and 21,160 to British South Africa. Of the inward passengers, 80,109 started from the United States, 47,300 from British North America, 20,238 from British South Africa, and 14,539 from Australia. The number of passengers of all nationalities to and from the Continent was 1,038,154 outward and 1,103,016 inward in 1923, as compared to 1,184,412 outward and 1,309,874 inward in 1913. In 1923, 256,284 British nationals left for non-European countries as emigrants and 57,606 returned as immigrants; the figures for 1913 were 389,394 and 85,709 respectively. Of the 1923 emigrants, 93,076 left for the United States, 88,290 for British North America, and 39,967 for Australia. The following table shows the total emigration of British nationals:

	1913	1922	1923
Male adults	178,538	77,073	135,870
Female adults	141,106	70,816	84,178
Children under 12	69,750	26,207	36,236
Total	389,394	174,096	256,284

Of those moving in 1923, 140,891 departed from England, 4529 from Wales, 88,584 from Scotland, and 22,280 from Ireland, as compared with 271,756, 5040, 68,202, and 44,396, respectively, in 1913.

Education. Elementary education was under the control in England and Wales of the Board of Education, in Scotland under the Committee of Council on Education, and in Ireland under the Commissioners for National Education. Elementary education was free and compulsory from 5 to 14 years. In 1921, there were 21,584 elementary schools in England and Wales with 7,150,000 pupils and 170,000 teachers, an increase over 1913, when there were only 6,046,500 pupils and 164,152 teachers. In addition, in 1921 there were 546 schools for the blind and defective with an enrollment of 38,326 pupils, as compared with 25,704 pupils in 347 such schools in 1913.

In 1921 there were 1205 secondary schools with 17,950 teachers and 340,000 pupils, while in 1913 there were only 1010 such schools with 13,790 teachers and 174,423 pupils. A similar increase was recorded in teachers' training colleges, of which there were 86 in 1913 with 11,876 pupils, and in 1921, 92 with 15,451 pupils. In 1920, there were 4831 evening schools with 751,327 pupils, as compared with 6876 in 1913 with 798,881 pupils. In Scotland there were 3426 public schools with 21,986 teachers and 860,984 pupils in 1913, and in 1921 there were 3387 schools with 24,484 teachers and 862,220 pupils. In Ireland in 1913 there were 8229 primary schools with 682,011 pupils, and in 1917 (last available total) there were 7947 schools with 682,561 pupils. The universities and colleges were rapidly recovering from the ill effects of the War. The 10 leading universities in England are Oxford, Cambridge, Durham, London, Manchester, Birmingham, Liverpool, Leeds, Sheffield, and Bristol. In Scotland, St Andrews, Glasgow, Aberdeen, and Edinburgh were the four leading Universities, and in Ireland, Trinity College (Dublin), Queens University (Belfast), University College (Cork), University College (Galway), and University College (Dublin), were the five leading institutions of higher education. The enrollment in such schools in the British Isles in the years 1913-14 and 1922-23 was as follows:

	Professors		Students	
	1913-14	1922-23	1913-14	1922-23
England	2,533	3,077	24,010	31,030
Wales	156	294	1,140	2,580
Scotland	564	747	7,550	11,190
Ireland	582	289	2,475	4,492
Total	3,785	4,407	35,175	49,242

Agriculture. In the British Isles, land was divided into three classes: rough grazing, arable land, and permanent grass. The following table shows the distribution of land in 1912 and 1922:

	1912 acres	1922 acres
England and Wales:		
Rough grazing	3,774,655	4,782,000
Arable land	11,335,276	11,310,515
Permanent grass	15,839,414	14,715,278
Scotland:		
Rough grazing	8,919,629	9,634,000
Arable land	3,325,027	3,338,068
Permanent grass	1,496,307	1,387,431
Ireland:		
Rough grazing	2,583,485	2,864,288
Arable land	4,988,551	5,270,615*
Permanent grass	9,685,227	9,122,360*

* Area in 1918.

The British farmer was in a bad economic position, as only 20 to 25 per cent of the food supply of the country could be produced within the country, and he had to meet the keen competition of products imported from countries more favorably situated, especially from the Continental countries of depreciated exchange. 1922 and 1923 were both bad years, the former because of a long drought and the latter because of persistent and heavy rains during the latter part of the summer and early autumn. The heavy burden of post-war rates, tithes, and taxes left little from the proceeds of crops for the landowner. One result was the return to permanent pasture of much of the arable land which was put under cultivation during the war period. In 1918, the total arable land in Great Britain and Ireland was 21,122,750 acres, approximately 1,500,000 more than before the War. The following table shows the acreage of crops in the British Isles:

Irish Free State	1912	1922
Horses	429,101	429,101
Cattle	4,326,294	4,326,294
Sheep	3,067,473	3,067,473
Pigs	919,449	919,449

To the above statistics on land, produce, and animals in the larger divisions of the British Isles should be added small amounts for the Isle of Man and the Channel Islands. In 1922 they were as follows

	Isle of Man	Channel Islands
Arable land	65,690	20,655
Permanent grass	17,955	9,894
Oats	19,472	1,965
Wheat	229	625
Barley	534	297
Turnips	6,526	
Potatoes	2,208	9,753
Horses	5,764	3,651
Cattle	19,291	16,244
Sheep	72,150	179
Pigs	3,709	960

	Great Britain		Ireland	Northern Ireland	Irish Free State
Crops	1912	1922	1912	1922	1922
Wheat	1,925,737	2,032,168	44,855	34,469	6,305
Oats	3,029,054	3,152,357	1,046,000	813,970	399,722
Barley	1,648,201	1,521,068	165,367	167,747	2,518
Beans and peas	488,308	462,691	1,700	447	1,188
Potatoes	612,671	718,581	595,184	400,982	168,567
Turnips	1,512,535	1,225,240	271,771	199,204	48,877
Mangolds	488,486	424,649	81,700	81,709	1,845

The following table shows the total produce of the principal crops of the British Isles:

Mineral Production. The principal economic resource of the British Isles was coal,

	Great Britain		Ireland	Northern Ireland	Irish Free State
Crops	1912	1922	1912	1922	1922
Wheat	6,979,795	7,979,000	195,493	5,725	32,232
Barley	6,404,841	5,804,000	871,059	2,066	151,581
Oats	13,741,883	14,101,000	6,858,196	306,594	573,248
Beans and peas	1,455,165	1,115,000	8,403		
Potatoes	3,179,632	5,203,000	2,546,710	1,251,709	2,179,532
Turnips	20,278,639	17,788,000	3,783,218	761,005	2,673,770
Mangolds	8,836,718	8,595,000	1,301,048	30,669	1,298,943

One of the economic resources of the British Isles was the pasture land on which were raised the large flocks of sheep. These flocks were the early foundation of the textile industry, which continues one of England's greatest. During the latter part of 1923 a serious epidemic of hoof and mouth disease broke out in England and large numbers of cattle and sheep had to be killed before it was brought under control. The following table shows the number of live stock in 1912 and 1922:

	1912	1922
England and Wales		
Horses	1,248,003	1,119,545
Cattle	5,841,720	5,722,661

Northern Ireland		
Horses	...	115,863
Cattle	...	830,831
Sheep	...	499,048
Pigs	...	117,277

which served as fuel not only for industry, but also for the British merchant marine and as a return cargo for vessels entering British ports. It was one of the principal articles in export trade, for production was in excess of home consumption. The 10 years 1914-24 were difficult because of the war demands and the subsequent period of depression. The record year for production of coal was 1913; from then a gradual decline was recorded until 1918, which was followed by two years of slight increase, but in 1921, because of the strike which lasted 88 days, a very low record of production was shown. The years 1922 and 1923 showed decided improvement; 1923 was the second highest year on record. Employment in the mines followed somewhat similar lines, except that the lowest number employed was in 1915 and the greatest in 1920. The year 1921 was difficult for miners; they were out on strike for nearly three months because of wage disputes. The trouble finally ended in an agreement to base wages on the cost of living index and the volume of business. In January, 1924, general dissatisfaction with this wage agreement resulted in ballot vote by the miners to serve the required three months' notice of termination. Negotiations were, in the summer of 1924, proceeding for a new wage agreement. The following table shows the number of wage earners, total out-

put, exports, and bunkered coal for the period 1913 to 1923:

Year	Persons Employed	Output	Coal and Coke	Bunker
		Tons	Export Tons	Tons
1913	1,127,820	287,411,869	76,688,446	21,023,693
1914	1,133,746	265,664,393	61,830,485	18,535,616
1915	953,642	253,206,081	45,770,344	13,630,964
1916	993,063	256,348,351	41,157,894	12,988,172
1917	1,021,340	248,473,119	37,800,705	10,227,952
1918	1,008,867	227,746,654	34,173,915	9,756,476
1919	1,191,313	229,779,517	36,466,593	12,004,812
1920	1,248,224	229,295,000	28,862,895	13,914,903
1921	1,126,000	164,303,000	26,246,839	11,046,548
1922	1,129,500	233,899,000	67,939,476	18,292,000
1923	1,178,500	278,499,600	84,486,728	18,158,188

One of the outstanding factors in the above table was the decline in the exports of coal during the War, when a heavy domestic demand cut down the amount available for export by half. The years 1922 and 1923 were normal years in the export trade; in fact, the exports during 1923 were the largest on record. The principal export areas were the South Wales and north-eastern fields. The largest factor in the in-

of stimulation by the occupation of the Ruhr, but in the long run this brought on adverse results in the increased price of fuel and the delayed revival of confidence. The following table shows the number of furnaces in blast and the output of pig iron, steels ingots, and castings in 1913, 1920, 1921, 1922, and 1923.

Year	Furnaces in Blast	Output	
		Pig Iron Tons	Steel Ingots and Castings Tons
1913	338	10,250,000	7,660,000
1920	285	8,007,900	9,056,800
1921	95	2,611,400	3,624,800
1922	132	4,899,500	5,820,500
1923	200	7,438,500	8,488,900

After the War, British manufacturers not only were burdened with heavy taxation but also had to meet keener competition from foreign producers, especially in countries of depreciated exchange. Total exports in 1913 were 4,969,224 tons; in 1922, 3,397,185 tons; and in 1923, 4,317,571 tons. These totals were made up as follows:

Commodity	1913 Tons	1922 Tons	1923 Tons
Pig iron and ferro alloys	1,124,181	793,763	894,298
Iron bars, rods, angles, etc.	141,452	31,403	43,615
Steel	251,059	221,109	354,144
Hoops and strips	45,708	48,281	71,619
Plates and sheets not under 1/2 in.	126,380	95,462	193,789
Black plates and sheets under 1/2 in.	139,927	224,836	338,978
Galvanized sheets	762,075	513,110	602,390
Tin, terne, and other coated plates	497,497	449,273	552,338
Rails	506,585	258,987	306,904
Railway material	267,254	218,370	186,537
Tubes, pipes, and fittings, cast and wrought	399,608	162,476	242,200
Wire	60,532	54,500	78,596
Wire manufactures	55,739	34,677	52,572
Total, including other items	4,969,224	3,397,185	4,317,571

creased exports of 1923 was the occupation of the Ruhr, which upset a large producing area and put a heavier share of the burden of supplying the European demand on the British mines. The greater part of the exports went to Europe, chiefly to France, Germany, Italy, Belgium, and Holland. The War completely upset some of the large markets, but most of them were regained after the Armistice.

The following table shows the principal countries to which Great Britain exported coal during 1913, 1921, 1922, and 1923:

Country	1913 Tons	1921 Tons	1922 Tons	1923 Tons
France	12,775,909	6,395,651	13,579,417	18,826,352
Italy	9,647,161	3,383,083	6,341,743	7,592,735
Germany	8,952,323	817,877	8,345,606	14,806,232
Russia	5,998,434	138,878	584,069	476,205
Sweden	4,563,076	1,232,904	2,522,820	3,168,367
Argentina	3,693,572	887,344	2,021,092	2,461,074
Egypt	3,162,477	1,017,748	1,743,643	1,696,054
Denmark	3,034,240	1,803,561	2,866,233	3,170,269
Spain	2,534,131	1,021,172	1,711,021	1,145,801
Norway	2,298,345	694,316	1,566,969	1,809,758
Belgium	2,031,077	618,066	3,489,419	6,504,592
Netherlands	2,018,401	1,787,678	6,067,789	6,794,346

The iron and steel industry was not, by 1924, restored to pre-war activity, but in 1923 the pig iron output was about 74 per cent of that of 1913 and nearly three times that of 1921. The output of steel ingots and castings substantially exceeded the output for 1913 and was two and one-third times that of 1921. As in the case of coal, the War caused a general disruption of the industry and its chief markets, and they had not, by 1924, returned to the normal pre-war condition. An increase was recorded in 1923 because

Textile Industry. The cotton and woolen industries of Great Britain were located near the coal fields, the linen industry mainly at Belfast and Dundee, the lace industry at Nottingham, Derby, and Kilmarnock, and hosiery factories at Derby, Leicester, and Nottingham. The cotton industry depended entirely on imports of raw materials, while the woolen industry had to import two-thirds its wool, and the linen industry had to import one-half its flax. The cotton industry suffered more serious disorganization by reason of the War than any other industry. A large part of the cotton spinning and manufacturing machinery of France and Belgium was in the zone of hostilities, while the cotton factories of Russia were ruined in the early months of the Revolution, and England suffered a lack of raw material because of the submarine danger. Following the Armistice, England, with all her machinery intact, enjoyed a period of prosperity. Toward the close of 1920 the boom ended, and a serious depression set in, from which the industry had not recovered by 1924. During 1923, the short crop in America, plus the increased consumption by American mills, helped to cause a rapid rise in prices of raw materials. Economic disturbances in the chief markets of British cloth, i.e. China and India, caused them to cut down their purchases. The total number of cotton spindles in 1923 was 55,583,000, of woolen spindles 3,111,085, of worsted spindles 3,609,545, and of twisted spindles 1,352,196. The table on the next page shows the total imports of raw cotton, wool, and flax.

The principal sources of raw cotton were the United States, with 15,847,695 cents in 1913

GREAT BRITAIN

Linen piece goods *	193,681,300	77,435,600	89,671,700
Jute piece goods *	173,484,200	137,784,900	158,057,038
Jute yarns, (lbs.)	41,766,100	36,862,700	35,663,600

* Linear yards in 1913 and square yards in the other years.

Shipping and Shipbuilding. The shipping and shipbuilding trades were prosperous during the War. After the signing of the Armistice this abnormal demand ceased, and an excess of tonnage was the immediate result. The lack of demand for tonnage caused rates to fall, which, added to the fluctuating exchanges and unsettled economic conditions, caused considerable hardship to shipowners. The excess tonnage was further augmented by the tendency to convert many old vessels to the Diesel type, which gave more cargo space and less fuel space. In the shipbuilding trade a dispute of the boiler-makers caused a seven months' strike during

ports of the British Isles was about the same for 1913 and 1923. The total for 1913 was 116,883,387 tons: 1920, 73,108,000; 1921, 73,507,000; 1922, 103,006,072; and 1923, 116,854,335. The table on page 564 shows the entrances and clearances by nationalities for 1913 and 1923:

Railways. The railways of Great Britain went through trying years in the post-war period. During the War the government operated the railways. From the Armistice until Aug. 14, 1921, they were operated by the government in preparation to turning them back to private ownership. After that date they reverted to

private ownership, but the War disclosed a number of important problems for the companies. Costs of operation had increased tremendously and rates were advanced to the point where industries were suffering. The Railways Act of 1921 was passed, involving a reorganization of the roads in order to do away with expensive overhead and excessive competition. The roads were reorganized into the southern, western, northwestern, midland, west Scottish; northeastern, eastern, and East Scottish groups. Under this Act a rates tribunal and a wages board were also set up to deal with rates and wages. The effective date of the consolidation was Jan. 1, 1923. Considerable progress in new developments and new services were noted at the end of the first year. Rates on merchandise were reduced during 1923, by an average of 50 per cent of pre-war figures. The total mileage of track open for traffic, reduced to single track and including sidings, was 50,604 miles in 1913, 51,586 in 1922, and 51,782 in 1923. In 1923 this mileage was made up as follows: length of road, 20,233 miles; reduced to single track, 36,853 miles; and sidings, reduced to single track, 14,929 miles. On Dec. 31, 1923, the number of locomotives was 24,180 steam and 40 electric, as compared with 24,238 steam and 81 electric in 1922, and 23,581 steam and 83 electric in 1913. The number of merchandise, mineral, and special vehicles was 713,976 in 1923, 722,639 in 1922, and 735,294 in 1913. The traffic was divided as follows:

	1913	1922	1923
	Tons	Tons	Tons
General merchandise	67,755,470	52,844,446	58,773,000
Coal, coke and patent fuel	225,601,127	200,102,316	222,239,000
Other minerals	71,067,357	48,678,846	61,983,000
Total	364,423,954	301,625,608	342,995,000

The total number of passengers carried in 1923 was 1,430,715,629, with total passenger train receipts of £85,581,142 as compared to £54,525,821 in 1913. Total goods train receipts were £64,254,895 in 1913, and £106,567,677 in 1923. The total capital expenditure in 1913 was £1,141,543,561, and £1,181,200,000 in 1923. The total number of originating live stock carried during 1923 was 16,891,257, of which sheep made up 11,000,242 and cattle 3,278,680. No statistics were published on the railways of the Irish Free State. It was estimated that it had 2705 route miles of road.

Economic Conditions. British economic conditions continued to suffer from war influ-

ences, the intense industrial activity and over-expansion immediately following the Armistice, and the severe depression of 1921. Toward the end of 1922 a revival set in, based largely on the stability of the national financial position and the clearing away of overexpanded credits of 1919 and 1920. The revival continued through 1923, though not on as great a scale as was expected. The occupation of the Ruhr by France and Belgium, the capital levy proposal, and the general election, caused industrialists to hesitate. Perhaps the best evidence of the real progress made by Great Britain after the War was the steady rise of the pound sterling from the low post-war slump. The average annual rates were as follows: par value, \$4.8665; 1914 average, \$5.14; 1915, \$4.78; 1916, \$4.76; 1919, \$4.43; 1920, \$3.66; 1921, \$3.85; 1922, \$4.43; 1923, \$4.57.

The most unfavorable aspect of 1924 British conditions was the large number of unemployed. Unemployment increased tremendously at the close of 1920 and early in 1921 during the severe depression. The highest number on the unemployment registers was recorded on June 24, 1921, when 2,178,000 were out of work. A steady decline in this number followed, until Mar. 31, 1924, when only 1,038,000 were on the registers. The improved condition of trade materially aided this decrease, and also the large programmes of municipal and private works of improvement and repair which gave employment to many thousand workers. The passage of the Trade Facilities Act in 1921, whereby the Treasury could guarantee the payment of loans for the purpose of carrying out capital undertakings, also helped decrease unemployment. The following table shows the percentage of trade union members unemployed:

End of	1913	1920	1921	1922	1923
			(Per cent)		
January	2.2	2.9	6.9	16.9	13.7
February	2.0	1.6	8.5	16.3	13.1
March	1.9	1.1	10.0	16.3	12.3
April	1.7	0.9	17.6*	17.0	11.3

December	2.6	6.0	16.5	14.0	9.7

* Excluding coal miners.

There was, during the period surveyed, an increasing tendency to better the position of the laboring class and to legislate for their welfare.

In 1891 the total expenditure for social services was £22,629,379, which increased to £62,994,667 in 1911, to £306,737,843 in 1921, and to £371,716,891 in 1922. The principal schedules of expenditures were as follows, in thousand pounds sterling.

Items	1891 £	1911 £	1921 £	1922 £
National insurance (health)			29,875	30,634
Unemployment insurance			10,768	71,216
War pensions			100,919	88,921
Old age pensions		7,360	20,750	21,989
Education	11,468	33,490	88,788	92,375
Housing	242	888	4,693	5,220
Relief of the poor	9,351	16,747	35,626	46,846

Numerous industrial disputes occurred during 1923; chief of these were the seven months' lockout of the boilermakers and the "outlaw" strike of dockmen. In January, 1924, the coal miners gave notice of the termination of the wage agreement, the railway men went on a nine-day strike, and in February the dockmen walked out for 10 days. See UNEMPLOYMENT.

Commerce. The British Board of Trade estimated the total favorable balance of trade for Great Britain in 1923 as being £97,000,000. This represented a considerable decline, when compared with the balance of £155,000,000 in 1922, £252,000,000 in 1920, and £181,000,000 in 1913. The following table shows the comparative make-up of this estimate, in millions of pounds sterling.

Items	1913	1920	1922	1923
Excess of imports of merchandise and bullion	158	343	170	203
Net income from overseas investments	210	200	175	150
Net national shipping income	94	340	110	110
Commissions	25	40	80	30
Other services	10	15	10	10
Total invisible exports on balance	339	595	325	300
Available for investment overseas	181	252	155	97

British overseas trade was slowly recovering from the effects of the War which greatly upset many of the chief markets of the world. Previous to 1914 European markets were the chief outlet for British manufactures, but with the post-war economic uncertainties Great Britain sent more and more produce to her dominions and colonies. Following the War several plans were tried, to increase the foreign trade. The Export Credits scheme was passed in 1920; this authorized the Treasury to guarantee the payment of 80 per cent of the cost value of shipments to the new countries of Europe. In 1921 the Trade Facilities Act was passed, authorizing the Treasury to guarantee the payment of principal and interest on loans to be used for capital undertakings within the

Empire so long as it decreased unemployment and the material was purchased within the Empire. The Safeguarding of Industries Act was passed to prohibit the import of key commodities unless it was impossible to obtain a sufficient quantity in Great Britain. In Oc-

tober, 1923, the Imperial Economic Conference met in London and adopted resolutions for the further application of preferences to Empire goods, but the defeat of the Conservative government at the general election in December and the advent of the Labor government pledged to free trade brought that programme to an end.

The total trade of Great Britain in 1913 was £1,403,553,065 and in 1923 it was £1,983,916,935, an increase of 41 per cent. In considering a comparison of pre-war and 1923 figures, two things must be borne in mind, first, the great increase in prices over pre-war prices, and secondly, the fact that after Apr. 1, 1923, the trade of the Irish Free State was considered foreign trade. The increases occurred in all three cat-

egories, imports, exports, and reexports, and each year showed an adverse visible trade balance. The excess of imports was greater during the post-war years than in 1913, as shown in the following table.

			Excess of Imports (Millions of £)
1913			133.9
1914			171.7
1915			367.9
1916			344.6
1917			467.4
1918			783.8
1919			662.8
1920			375.4
1921			275.2
1922			179.9
1923			212.1

Exports	9,154,129	11,241,402	10,748,524

The increases in trade and its general trend are shown in the two preceding tables of trade by major classifications in 1913, 1922, and 1923.

The above table shows clearly the type of commerce in which Great Britain was engaged; i.e. the import of large quantities of foodstuffs and raw materials for industries, and the export of manufactured products. The following table gives the imports and exports of principal commodities, by quantities, which for comparative value eliminates the price factor:

	1913	1920 (In thousands of £)	1922	1923
EXPORTS				
Coal (tons)	73,400	24,932	64,198	79,449
Iron and steel, and manufactures of (tons)	4,969	3,251	3,401	4,319
Machinery (tons)	689	462	403	432
Cotton yarns (lbs)	210,099	147,432	201,221	145,019

* From Apr. 1, 1923.

As already mentioned, the Irish Free State did not publish trade statistics from Apr. 1, 1923, when it was formally separated from the British Customs Union, up to December, 1923.

Beginning with January, 1924, the Free State Government was to publish monthly statistics. In 1920 the ascertained direct exports from all of Ireland to countries other than Great Britain amounted to only £1,846,417 out of a total export trade of £204,715,138, or 0.9 per cent of the whole. During 1921 such exports amounted to £2,414,678 out of a total export trade of £129,621,000, or 1.86 per cent of the whole. The total trade of Ireland for the years 1911 to 1921 is shown by the table below:

The table on page 567 shows the estimated values of the principal items of the import and export trade of Ireland during the calendar years 1913, 1920, and 1921.

	Imports	Exports
1911	£267,610,000	£265,071,000
1912	73,953,000	67,168,000
1913	74,467,000	73,877,000
1914	74,125,000	77,311,000
1915	87,257,000	84,468,000
1916	104,517,000	107,171,000
1917	119,181,000	133,805,000
1918	126,016,000	152,931,000
1919	158,716,000	176,052,000
1920	203,750,000	204,715,000
1921	118,971,000	129,621,000

Finance. One of the most striking achievements of the British government after the Armistice was the very large reduction in government expenditures and the balancing of the budget. In contrasting the large post-war expenditure of the British government with the pre-war rate, it should be borne in mind that the annual debt charge was, by 1924, about £307,000,000, as compared to only £19,000,000 in 1913-14. The budget was balanced at approximately £200,000,000 in 1913, but due to heavy war charges it was balanced at £1,000,000,000 in 1921, at £900,000,000 in 1922, at £800,000,000 in 1923. Actual returns showed a surplus of £1,000,000 in 1913, of £230,000,000 in 1920-21, of £46,000,000 in 1921-22, of £101,000,000 in 1922-23, and of £48,000,000 in 1923-24. The tremendous surplus in 1920-21 was not the result so much of real savings as of large receipts from sales of surplus war materials. The standard rate of the income tax was reduced from six to five shillings on the pound sterling, for it was expected that the revival of business due

	1913	1920	1921

to lowered taxation would increase receipts. Results justified this bold policy, and in the 1923-24 budget the standard rate of the income tax was reduced to 4s 6d. per pound, and the corporations profit tax was also reduced. Contrary to the usual British practice, supplementary credits totaling £13,078,100 for various unexpected contingencies had to be voted during January and February, 1924. The actual receipts in 1913-14 were £198,242,897, and in 1923-24, were £837,169,000, while expenditures were £197,492,969 and £788,840,000, respectively. The table below shows the exchequer receipts in the fiscal years 1913-14 and 1923-24.

REVENUE	1913-14	1923-24
Customs	£35,450,000	£119,958,000
Excise	39,590,000	147,970,000
Motor duties	14,691,000	14,691,000
Estate duties	27,359,000	57,800,000
Stamps	9,966,000	21,570,000
Land tax, house duty, etc.	2,700,000	2,760,000
Land value duties	715,000	
Income tax	47,249,000	269,331,000
Super tax		60,640,000
Corporation profits tax		23,340,000
Post office	30,800,000	52,800,000
Crown lands	530,000	920,000
Interest on loans	1,579,972	12,607,000
Miscellaneous	2,303,925	52,782,000
Total	198,242,897	837,169,000

For expenditures during the same years see table at top of next column.

The funded debt on Mar. 31, 1914, was £586,717,872; liability in respect of terminable annuities, £29,532,219; unfunded debt, £35,000,000, making a total "dead weight" debt of £651,270,091. Additional capital liabilities of £56,384,010 brought the gross debt to £707,654,110. The

EXPENDITURE	1913-14	1923-24
National debt services	£19,271,515	£307,309,000
Sinking fund	5,228,485	40,000,000
Road improvement fund	1,394,951	14,090,000
Local taxation accounts	9,734,128	13,662,000
Land settlement		1,209,000
Payments for Northern Ireland		3,967,000
Other consolidated funds	1,693,890	2,803,000
Army, navy, and air force	77,179,000	105,800,000
Civil services	53,901,000	239,366,000
Post office and revenue departments	29,090,000	60,634,000
Total	197,492,969	788,840,000

following table shows the standing of the public debt on Dec. 31, 1922, and 1923:

ITEMS	Dec. 31, 1922	Dec. 31, 1923
(In hundred thousands)		
Funded debt	£314	£314
Terminable annuities	15	14
3½ per cent conversion loans	690	683
Other war loans	2,548	2,571
Short dated bonds	1,839	1,842
National savings certificates	350	367
Other debt	1,071	1,149
Other capital debt	67	68
Floating debt—		
Ways and means advances	222	211
Treasury bills	719	649
Total	7,835	7,868

On Apr. 29, 1924, Philip Snowden, Chancellor of the Exchequer, presented an estimated budget for 1924-25, balancing at £794,050,000. The chief feature of this budget was the repeal of the McKenna duties on motor cars, musical instruments, clocks, and films, effective Aug. 1, 1924. The corporation tax was to be repealed, entertainment tax reduced, and the "breakfast table" duties reduced by half.

REVENUE	000's omitted	EXPENDITURE	000's omitted
Customs	£101,800	National debt services	£350,000
Excise	135,900	Northern Ireland	8,500
Motor duties	15,600	Road improvement fund	15,000
Estate duties	56,000	Local taxation accounts	13,150
Stamps	21,000	Land settlement	750
Land, etc.	1,250	Other consolidated funds	2,440
Income	265,000	Army	45,000
Super tax	61,000	Navy	55,800
Excess profits	8,000	Air service	14,511
Corporations	20,000	Civil services	227,573

Ordinary	11,850		
Special	30,000	Surplus	4,024
	794,050		794,050

Although the Irish Free State was to be given full fiscal autonomy by the Irish Free State Act of 1922, taxation in force at the time of establishment of the Free State continued unaltered until Mar. 31, 1923, and British and Free State finances were intertwined to a considerable extent during the 1922-23 fiscal year. For that year total expenditures amounted to £29,600,000 and total revenue to £27,900,000. After adjustments in the accounts of the two governments, the total deficit was approximately £4,000,000. The following table shows the result of the 1923-24 budget and the estimates for 1924-25 as presented to the Dail on Apr 25, 1924:

	ITEMS	1923-24	1924-25

HISTORY

On the Eve of the War. So numerous and so vitally important were the events crowded into the decade 1914-24 that the historian may well regard these momentous years as one of the most significant periods in British history. Under the shock of worldwide war, the balanced poise of the two-party system and the complacent political moderation inherited from the Victorians were suddenly destroyed; and epochal changes, to consummate which in calmer times would have required generations, were accomplished with startling rapidity. By a Reform Bill (1918) more sweeping than those of 1832, 1867, and 1884, were enfranchised 8,000,000 citizens; the Labor party, stimulated by world unrest, grew from infancy to maturity almost over night, and a socialistic Labor government, hitherto considered a subject only for imaginative novelists and fanatical revolutionists, became a reality in 1924; the Gordian knot of Irish home rule, at which successive generations of cautious British statesmen had vainly fumbled, was cut with one brusque stroke in 1921; the self-governing dominions, suddenly coming of age, required a swift transformation from empire into commonwealth, while Indian and Egyptian nationalism, taking a sudden spurt, made what before 1914 would have been considered incredibly rapid progress toward autonomy.

Before dealing with these and other events in detail, it may be helpful to summarize the situation in Great Britain on the eve of the War. Since 1905 the Liberals had been in power, under the leadership, first, of Sir Henry Campbell-

Bannerman and then of Herbert H. Asquith. The latter, keen of intellect, coldly brilliant in debate, temporizing and conciliatory but always dignified in action, had skillfully presided over a Liberal cabinet comprising both aggressive chauvinists like Winston Churchill and reputed pacifists like Sir Edward Grey, Lord Morley, and John Burns; radical reformers like David Lloyd George and men of more conservative liberalism, such as Reginald McKenna; and he had held together a parliamentary majority precariously combining about 270 Liberals, 84 Irish Nationalists, and about 42 Laborites (figures for elections of December, 1910). Such a coalition, inherently weak, was necessary to confront the 274 Unionists who solidly filled the Opposition benches. To reward its loyal Irish Nationalist supporters, the Liberal cabinet had persistently, though perhaps without personal enthusiasm, endeavored to pass an Irish Home Rule Bill (introduced in 1912, passed by the Commons and rejected by the Lords twice in 1913, passed by the Commons a third time in the spring of 1914). To conciliate the Labor party, and also defer to the sincere convictions of the more radical Liberals, salaries had been given to Members of Parliament, trade unions had been protected in their industrial and political action by favorable laws, and a remarkable series of social reforms had been enacted, such, for example, as the extension of workmen's compensation (1906), regulation of sweated industries (1909), the minimum wage law for miners (1912), old age pensions (1908), and national sickness insurance for workers (1911), government labor exchanges (1909), and free meals for poor school-children (1906). In pursuance of traditional Liberal policies, the House of Lords had been curbed (1911); a measure against plural voting and another against the privileges of the Established Church in Wales had been brought forward, though not yet finally carried over the Lords' stubborn obstruction, a "land reform" campaign against the landed aristocracy had been rather luridly launched by the valiant and vitriolic Chancellor of the Exchequer, Lloyd George, in 1913-14; and, above all, the sacred principle of free trade had been faithfully preserved against imperialist and protectionist assaults.

In July, 1914, just before the war clouds broke, the political atmosphere in Britain was unusually electric. Suffragettes were attempting to win the franchise by violent demonstrations; London was in the throes of a building trades strike; titled landlords were nervously awaiting the impending conflict over land reform; the stalwarts of the House of Lords were predicting dire civic convulsions if the cabinet should carry out its announced intention of promulgating the Irish Home Rule and Welsh Church Disestablishment bills, which, having been passed by the Commons a third time in the spring of 1914, could now, under the Parliament Act, be presented for royal signature regardless of the Lords' opposition; high army officers had virtually mutinied rather than accept responsibility for maintaining order in Ulster; and in Ireland unlawfully organized volunteer armies, representing respectively the Ulster Unionists and the Irish Nationalists, were arming themselves with smuggled rifles for an apparently inevitable civil war. Indeed, blood had already been spilled at Dublin in a clash between soldiers and National Volunteers. Like leaves be-

fore the hurricane these issues were swept into the background by the tempest which arose in the Balkan storm centre in midsummer, 1914.

Entry into the War. That the British Secretary of State for Foreign Affairs, Sir Edward Grey, sincerely desired if possible to avert the catastrophe of August, 1914, post-bellum historical research seems to have proved almost beyond question; that by secret understandings with France (1904, 1906, 1912) and Russia (1907, 1908) he had so tied his hands as to make British intervention in any general war virtually inevitable, seems also to be the verdict of scholars; but whether he could have preserved peace by taking a position more openly and unreservedly either for or against France and Russia, is debatable. Though he had been warned by the German ambassador as early as July 6 that the Serajevo incident might produce an Austro-Russian crisis, Grey waited, inertly hopeful, until July 23, when he asked the Austrian Ambassador what action Vienna intended to take against Serbia. Although disinterested in the merits of the Austro-Serbian dispute, Grey feared Austro-Russian complications, and on July 24 proposed mediation by the four other Great Powers. While the British fleet, which had assembled on July 16 for practice manoeuvres, was ordered by the ever-watchful Churchill on July 26 to remain mobilized, Grey continued during the next nerve-racking week to urge mediation, while he urged the cabinet to decide for intervention or neutrality in the coming struggle; if neutrality, he added, some other man must be given his portfolio. But the cabinet, almost equally divided, could make no decision, and therefore Grey of necessity had to use many "ifs" and "buts" in his communications to European capitals; he was able neither to offer unqualified pledges to France nor to make unreserved threats to Germany. In fact, as late as July 29 he told the French Ambassador, Cambon, that Britain's course was still undecided; to the German Lichnowsky he issued the famous warning that "if the issue did become such that we thought British interests required us to intervene, we must intervene at once." When the German government, taking alarm, offered a pledge not to annex French territory (not including French colonies), Grey heatedly refused to "bargain away" his loyalty to France or his interest in the neutrality of Belgium. If Germany made any "reasonable" pacific proposal, and France and Russia rejected it, Britain would stand aloof, he later informed Germany; otherwise "we should be drawn in." Even on July 31, while Russia and Austria were mobilizing, while Unionist journals in England were urging intervention and the Liberal press was advocating neutrality, while Poincaré and Cambon were pleading for a definite promise of aid, Grey was still endeavoring to keep a "free hand." To a German offer to respect Belgian neutrality and the French colonies, Grey still reiterated, "We must keep our hands free." On August 2, however, Unionist leaders, Lord Landsdowne and Bonar Law, sent a letter to the Premier stating their opinion that to hesitate in supporting France and Russia "would be fatal to the honor and security of the United Kingdom." With this letter before them, the cabinet ministers authorized a promise to defend France against hostile action of the German fleet. Four ministers, strongly opposed to intervention, offered their resignations, but only

two, Burns and Lord Morley, insisted on withdrawing from a government which they felt was now committed to war. Meanwhile, the German ultimatum had been presented to Belgium, August 2, and Belgium appealed to England for "diplomatic intervention," August 3. Such was the situation on the day when Grey made his celebrated speech before Parliament in revelation of the secret Grey-Cambon correspondence of 1912 and his promise of August 2 to defend the French coast; he discussed the menace to Belgium and lightly declared, "If we are engaged in war, we shall suffer but little more than if we stand aside." Bonar Law pledged support; John Redmond, the Irish Nationalist leader, offered Ireland's loyalty; only the Labor leader, Ramsay MacDonald, seemed unconvinced. Assured of Parliamentary backing, the government on August 4 instructed Sir Edward Goschen, British ambassador in Berlin, to demand from Germany before midnight a pledge to respect Belgian neutrality. As expected, Germany refused, and on August 5 Premier Asquith informed the Commons that Great Britain was at war with Germany, "to fulfill a solemn international obligation" (to Belgium) and "to vindicate the principle that small nationalities are not to be crushed, in defiance of international good faith, by the arbitrary will of a strong and overmastering Power." Such undoubtedly was the feeling of many Englishmen, but it is certainly not less true that England's entanglement in the Triple Entente through imperialist bargains with France (1904) and Russia (1907) was also so strong a reason for intervening that Grey had favored intervention even before he knew that Belgium's neutrality would be violated.

Immediate Effects of War. Navy and army alike were prepared for the crisis, and efficiently prepared in so far as pre-war statesmen considered necessary. The navy, already mobilized, steamed forthwith to its war stations in the North Sea, with Admiral Sir John Jellicoe in command, under the enthusiastic though perhaps too imaginative supervision of Winston Churchill, First Lord of the Admiralty. The army had been organized by Lord Haldane (War Minister) to provide a Home Defence Force and a small Expeditionary Force of four infantry divisions and one cavalry division. Everything was ready "down to the last gaiter button," when the Expeditionary Force was ordered to France under Sir John French in August. Lord Kitchener, famous for his military exploits in South Africa and the Sudan, took charge of the War Office and began to organize by voluntary enlistment a new army, "Kitchener's Army," to reinforce the troops in France; for the war, he predicted, would last three years. Parliament, in patriotic loyalty, dropped its pre-war partisan quarrels and consented to act as a rubber-stamp for the government's war measures, obediently voting a war credit of £100,000,000; an army increase of 100,000 men; a navy increase of 67,000 men; governmental control of railways and war insurance of trade; a Defence of the Realm Act providing court-martial for spies; restriction of the liquor traffic; a moratorium; and other emergency measures. Even when the ministry decided to promulgate as laws the controversial Welsh Church and Irish Home Rule bills, in September, 1914, together with a Suspensory Act, postponing their operation, the Unionists acquiesced, albeit

Bonar Law and Sir Edward Carson, while declaring their loyalty, accused the Asquith Cabinet of violating the "party truce" which had been tacitly adopted in the presence of external peril. Despite the Suspensory Act, Mr. Redmond, as Nationalist leader, was willing to cry "God save England," when Parliament closed its session on September 19, and in a manifesto he exhorted Ireland to contribute its share of recruits for Kitchener's army. As for the Labor party, the pacifist Macdonald was replaced by the patriot Arthur Henderson as chairman, and only a minority continued to condemn the War. When Parliament reassembled in November, to grant an additional war credit of £225,000,000, a 100 per cent increase of the income tax as well as increased taxes on tea and beer, and an addition of 1,000,000 men to the army, the country began to realize the shortsighted levity of Sir Edward Grey's prediction that England would suffer "but little more" as a belligerent than as a neutral. Nevertheless loyalty and the party truce were still observed, and the government was permitted to conduct the war in secret, without political opposition or interference. So overwhelming was the pressure of multifarious unfamiliar problems on the cabinet that for greater efficiency, or rather for less inefficiency, the management of military and naval affairs was transferred in November, 1914, from the full cabinet to a War Council in which Asquith, Lord Kitchener, and Churchill, with the assistance of technical experts, decided major questions of war policy. Even so, there was much blundering and more negligence by well-intentioned but overburdened ministers. Lord Kitchener, particularly, insisted on bearing a load of War Office routine which bowed even his broad shoulders. Such mistakes naturally invited criticism: nor were the Unionists sufficiently bound by the party "truce" to refrain from pointing out the ministry's shortcomings. See NAVIES OF THE WORLD.

Fall of the Liberal Government. When Bonar Law said in December, 1914, that perhaps the Opposition had not criticized the government enough, he was in effect heralding the advent of renewed though more or less covert partisan controversy, which ultimately compelled Premier Asquith to silence his critics by granting them portfolios in his cabinet. What the Opposition particularly censured was the government's failure to provide adequate munitions, but there were other grievances as well. Inflamed by German submarine outrages in the spring of 1915 and by the Bryce Committee's report on German atrocities in Belgium, the war spirit now burned so fiercely that it demanded more severe measures against enemy aliens and a more drastic blockade of Germany. England, it should be explained, had not yet cast off the restrictions of the Declaration of London on her right to interfere with neutral shipping. Consumers, moreover, were beginning to cry out against food profiteers and to demand rigorous price-control. The press was restive under the irksome restrictions on war news imposed by Sir Stanley Buckmaster's Press Bureau. Furthermore, the most ardent patriots were beginning to complain that voluntary enlistment for Kitchener's army not only failed to produce an adequate number of recruits but also operated very unfairly and drew workers and experts from industries in which they were indispensable, while shirkers

stayed at home. Above all, two military fiascoes brought the cabinet under fire. One was the Dardanelles campaign, originally undertaken with Lord Kitchener's approval as a means of relieving the Turkish pressure on the Russians, who had appealed for aid. This attack on the Straits in the spring of 1915 was eagerly sponsored by the civilian First Lord of the Admiralty, Winston Churchill, who in his autobiographical *World Crisis* tells how, in his opinion, the plan offered a possibility of decisive strategic gains but was stultified by Kitchener's vacillation and preoccupation with the western front and by the opposition of Lord Fisher (First Sea Lord), the commanding admiral, and other naval officials. The failure, so tragically short of success, at Gallipoli, not only evoked bitter criticism from the public, but caused a serious rift in the War Council itself. This crisis coincided with a stormy public discussion of the shortage of munitions, provoked by the disastrous battle of Neuve Chapelle (March, 1915), in which the General Staff's hope of blasting a breach through the enemy lines was frustrated by a shortage of high explosive shells. At any rate, so Colonel Repington reported to the *Times* in May, and so the public believed, despite Asquith's denials. The popular charge that munitions production had been inefficient and shortsighted could hardly be refuted. Until March, 1915, Lord Kitchener had permitted skilled munitions workers to enlist in the army for service in France and had failed to evolve any policy which would avert strikes and permit "dilution" with unskilled labor in munitions works. Nor had he adequately curbed munitions profiteers, or effectively organized the industry. Until March, 1915, he had insisted on placing contracts only with the big armament firms, ignoring small independent contractors, and eschewing governmental control. A Defence of the Realm Act passed in the spring of 1915 and authorizing the government to take over munitions plants was allowed to remain virtually a dead letter. Spurred by criticism, the War Minister, however, did permit the formation in April of a committee headed by Lloyd George to control munitions contracts; it was the same Lloyd George who took the initiative in persuading the trade unions to put national security above labor interests, and who urged the Premier to reorganize the cabinet, including a department of munitions.

The Coalition, 1915-16. Pressure from the energetic Welshman, the Opposition's demand for a coalition, and the Churchill crisis combined to overcome Asquith's predilection for party government. The Opposition, Bonar Law later said, could have turned the Liberal government out at this time but instead consented to Asquith's plan for a coalition cabinet. In the coalition formed in May, 1915, eight Unionists were given ministerial posts, their leader, Bonar Law, taking the Colonial Office, Balfour the Admiralty (in place of Churchill, who received the Chancellorship of the Duchy of Lancaster), Austen Chamberlain the India Office, Arthur Henderson, Labor leader, accepted the portfolio of Education; the truculent spokesmen of Ulster, Sir Edward Carson, became Attorney General; but Redmond, the Irish Nationalist, declined to join the cabinet. Perhaps most significant of all was the creation of a new Ministry of Munitions (authorized by law, June 9,

1915) with Lloyd George in charge. With characteristic vehemence, this rising minister threw his whole dynamic personality into the task of persuading, cajoling, and coercing if need be, employers, workers, and officials to collaborate in the supreme task of preparing the means of victory. By a Munitions of War Act (July 2) he forbade strikes and lockouts, obtained authority to regulate wages and profits in "controlled" munitions plants, provided for the recall of skilled workers from the army, and suspended restrictive trade union rules. When the Welsh coal miners went on strike, he hurried in person to win them back to work. In person he begged the Trade Union Congress not to disgrace labor by shirking patriotic duty. In person he solicited the aid of experts and organizers. By July 28 he could report the enrolment of nearly 100,000 munitions volunteers and the establishment of 20 national factories. On his own responsibility, in August, he ordered preparation of munitions for an army of 100 divisions, though critics thought so huge a force inconceivable. His audacity in expanding the output of heavy guns and other supplies was soon vindicated, for in the later months of 1916 British artillery in France was firing as many tons of munitions in an hour as it had fired in a day during the first year.

It was Lloyd George, again, to whom the Cabinet had to turn in 1916 to deal with the Irish question, after the Easter Rebellion in Ireland (q.v.) Asquith had visited Dublin, and, having received the impression that the existing government had broken down, authorized the successful munitions minister to negotiate a compromise by which the Home Rule Act of 1914, hitherto a dead letter, might immediately be put into force. Lloyd George proposed to apply the act but to exclude six Ulster counties during the War and to preserve Irish representation at Westminster only through the war period. This was too much for the Unionists in the Cabinet to swallow, however, and Asquith, by weakly permitting them to qualify and denature the proposal, cut the ground from under the negotiations. The resulting failure merely antagonized the Nationalists, and thereafter the Cabinet allowed the Unionists to dictate repressive Irish measures, while the Sinn Féin movement in ensuing years gradually won the masses away from the more moderate Nationalist tactics.

In dealing with the man power question the Asquith Coalition was hardly less inept. Vainly attempting the impossible task of pleasing both the conscriptionist Northcliffe press and the anticonscriptionist trade unions, Asquith compromised at first on a National Registration Bill; then induced Lord Derby in October, 1915, to conduct a spirited voluntary recruiting campaign, reinforced with a threat to apply compulsion if this failed; then, early in 1916, put through a Compulsory Service Act, applying merely to bachelors and childless widowers between 18 and 40, excluding Ireland, and exempting clergymen, necessary war workers, sole supporters of families, conscientious objectors, and the physically unfit. Both the jingo press and the trade unions were displeased, for opposite reasons. Assailed by prominent critics in both houses of Parliament, the Premier had to plead for the life of the Cabinet, and prepare a new compromise in April, going a step further toward universal conscription, but still

with many reservations. This was so coldly received that at length, on May 3, 1916, the government produced a Universal Military Service Bill applying to all men between 18 and 41, Ireland was still excluded, and exemptions were so numerous that the Asquith government received little applause for its tardy and hesitant conversion to universal service.

During its term of office, from May, 1915, to December, 1916, the Asquith Coalition dealt with numerous other matters. Parliament should have terminated in December, 1915, under the Parliament Act, but it prolonged itself by statute, without elections. The blockade of Germany was tightened by increasing the list of contraband commodities and finally by abandoning the Declaration of London, in June, 1916. A Joint Air Board, representing army and navy interests, was set up in May, 1916, to stimulate production of airplanes. Huge votes of credit were granted; the cost of the war increased from £2,700,000 to £3,500,000 a day in the half year from March to September, 1915, and to £5,000,000 a day in November. By March, 1916, the votes of credit for the War reached a total of £1,782,000,000. Most of this expenditure was covered by war loans, but the income-tax, doubled by Lloyd George, was raised 40 per cent more by his successor, McKenna, in September, 1915; an excess profits tax of 50 per cent was applied to war profiteers; duties on sugar, tea, tobacco, etc., were increased, and heavy taxes levied on imported motor cars, films, and other luxuries. In April, 1916, McKenna again raised the income tax, to a maximum of 5 shillings on the pound, the excess profits tax to 60 per cent, and other taxes proportionately. In courageous self-taxation during the War, Great Britain was unique and financially prudent.

The Coalition Cabinet suffered more than one defection before it finally collapsed. Sir John Simon, Home Secretary, resigned as a protest against conscription; Sir Edward Carson, in November, 1915, because of the government's bungling Balkan policy; Winston Churchill, because he was excluded from the War Committee of the Cabinet which was formed on Nov. 11, 1915. Lord Kitchener, en route to Russia, was lost when his ship struck a mine, in June, 1916, and was replaced as War Minister by the indefatigable Lloyd George. Sir Edward Grey, incidentally, accepted the title of Viscount Grey of Falloden and entered the House of Lords, retaining the portfolio of Foreign Affairs, but leaving defense of the Coalition's conduct, in the Commons, to his able under-secretary, Lord Robert Cecil.

The Lloyd George Government, 1916-18. The fall of the Asquith Cabinet was caused by the long accumulation of ineptitudes, compromises, hesitations, vacillations, some of which have been chronicled above. It was precipitated by demands for a small war cabinet. Even in the autumn of 1915, Lord Cromer and Sir Edward Carson had exposed the unwieldiness of the cabinet. To meet their criticism, Asquith had formed a war committee (himself, Balfour, Lloyd George, Bonar Law, McKenna), but this was merely a committee of the cabinet. In December, 1916, Lloyd George, backed by the *Times*, demanded that supreme responsibility for war affairs be given to a committee, consisting of himself, Sir Edward Carson, Bonar Law, and a representative of Labor. This would have meant transferring war policy to

an inner cabinet headed by Lloyd George, with Asquith remaining the puppet premier of the ministry as a whole. Naturally Asquith refused; thereon Lloyd George resigned, and a cabinet crisis ensued. Bonar Law, on being invited by the King, confessed his inability to govern without Asquith's support and recommended the War Minister. Accordingly David Lloyd George headed the new Coalition Cabinet which was formed in December, 1916. To secure efficiency he instituted a striking constitutional innovation by creating a small war cabinet of five members, to sit daily, and to have absolute control of Britain's war effort. The Premier himself, Lord Milner of South African fame, and the Labor leader, Henderson, constituted the controlling triumvirate, but Lord Curzon, leader of the House of Lords, and Bonar Law, leader of the Lower House and Chancellor of the Exchequer, were also members, though more or less preoccupied with other duties. While the War Cabinet was narrowed down to five persons, the number of other ministers was increased. Five new ministries were created: Shipping Control (Sir Joseph Maclay, a shipping magnate), Food Control (Lord Devonport, a grocery magnate), Air (Lord Cowdray, a contractor and oil magnate), Labor (Hodge, a Laborite), and Pensions (George Barnes, another Laborite). Lord Grey, who refused to desert Asquith, was replaced at the Foreign Office by the aged veteran, Balfour; Sir Albert Stanley, previously director of omnibus and underground systems, headed the Board of Trade; Lord Rhondda, a coal baron, took charge of Local Government; Prothero, former manager of the Duke of Bedford's estates, was appropriately selected for Agriculture; H. A. L. Fisher, a famous historian, was well chosen for Education; Sir Edward Carson took the Admiralty; Lord Derby, the War Office; Walter Long, Colonies; Dr. Addison, Munitions; Sir Frederick Cawley, the sinecure Duchy of Lancaster; Sir George Cave, the Home Office; Sir Robert Finlay became Lord Chancellor, and Sir Gordon Hewart, Solicitor General. It will be observed that Premier Lloyd George, boldly departing from tradition, had preferred experts, especially business experts, to politicians as heads of administrative departments, and that the Unionists, hitherto a minority in the Coalition, now predominated in the War Cabinet and in the strategic ministerial posts.

Of the Lloyd George government great things were expected, for the name of its premier had become a synonym for patriotic energy. As budget-maker, then as Munitions Minister, then as War Minister, he had exhibited unsurpassed vigor and enthusiasm; he had stirred the Allied world by his ringing, if inelegant, declaration that the fight with Germany "must be to a finish," to "a knockout." To him Englishmen now looked for miracles. Of these, there was none, but of vigor there was much. The German peace offer made in December, 1916, was rejected. During the remainder of the War, new conscription laws were passed, raising the age limit, combing over the supposedly exempt and unfit, and culminating in the 1918 law which drafted men up to 55 years of age and which for the first time included Ireland. To defeat the aim of the German submarine campaign of 1917, the government assumed control of British shipping and built new tonnage with desperate haste. For zeal in this matter there

was indeed necessity, for in 1917 some 4,009,537 tons of British shipping, out of a total of 20,000,000, were sunk, as compared with only 1,163,474 built; and in the first nine months of 1918 the Germans succeeded in sinking only 1,925,512, as compared with 1,310,741 constructed. The submarine campaign, by lessening the cargo space available for food imports, threatened England with slow starvation; to avert this peril the government not only established food-rationing and price-regulation, but also offered bounties for domestic grain production and fixed a minimum wage of 25 shillings for agricultural labor. When reproached for not doing more, Bonar Law declared that in 1917, while putting 820,600 additional men into the army, the government had brought 1,000,000 more acres under the plow, producing 850,000 tons of grain and 3,000,000 tons of potatoes, and had built over 1,000,000 tons of shipping, as compared with about 500,000 the previous year. Furthermore, mines, textiles, railways, and the liquor traffic were brought under governmental control, for reasons dictated by war necessity. Votes of credit, of course, became larger and more frequent as the cost of the War rose to almost £7,000,000 sterling per diem in 1917-18. The total credits granted for the War were brought by appropriations in 1918 to the stupendous total of £8,742,000,000, of which about £1,463,000,000 was lent to other Allies. As before, the bulk of the burden was passed on in the form of debt to future generations, but Great Britain in the years 1917-18 taxed herself unflinchingly. The normal income tax was raised to 6 shillings in the pound, with super-taxes running up to 4s. 6d.; increases were put on liquor, tea, sugar, tobacco, luxuries, postal rates, etc. Of the many measures adopted to preserve the morale of labor and industry under the stress of war, perhaps the most significant was the Whitley Reconstruction Committee's Report, June, 1917, proposing the establishment of Joint Industrial Councils representing capital and labor in each industry, to settle disputes amicably, and, more important, to nip misunderstandings and controversies in the bud. The proposal was only a recommendation, not a compulsory law, but it was voluntarily adopted in some trades, and it bore witness to the government's desire to build for a future beyond the anticipated military victory. Another of the Lloyd George Cabinet's war measures, of far less importance in the long run, was the wholesale Anglicization of the royal family, by substituting good English names for hereditary surnames of too Teutonic a flavor: in July, 1918, the reigning dynasty, the house of Saxe-Coburg and Gotha, became the house of Windsor; a month earlier, the Prince of Teck had been ordered to change his family name to Cambridge, and the Battenbergs translated themselves into Mountbattens.

Important Reforms. Constitutional and political reforms of far-reaching significance were adopted in the midst of frenzied efforts to win the War, during the years 1917-18. Probably the most remarkable of these was the Representation of the People Act of January, 1918. The desire for reform of the franchise had been bruited before Asquith's fall, particularly by the suffragettes, but the Asquith Cabinet, divided against itself, had been unable to take any decided stand on the issue. The Lloyd George government took action on the basis of

a report from a Speaker's committee representing all parties, and in May, 1917, presented a bill embodying the committee's proposals and allowing the Commons to do as they pleased regarding the controversial questions of woman suffrage and proportional representation. By 214 to 17, the house incorporated woman suffrage; but proportional representation it rejected, excepting for university elections. The vote was given not to all women (that would have been too radical a step for British politicians), but to women over 30 years of age, who were qualified as local government electors by occupying land or premises of the yearly value of not less than £5, or of a dwelling house, or whose husbands occupied such property; moreover, women over 30, graduates of universities, were entitled to votes for their university representatives in Parliament. It may be remarked, by the way, that later in the same year a bill was passed enabling women to sit in Parliament, and that in 1922 three women were elected; in 1923, eight. The complicated existing franchises for men were swept away and replaced by a simple six months' residence requirement for all males over 21 (except conscientious objectors) and sailors and soldiers (who were included at the age of 19). Plural voting was restricted; a citizen could vote for his place of business or for his university as well as his residence, but not in more than two constituencies as of old. The registration period was reduced from 12 months to six. Also all polls were to be held on the same day, in a general election. Finally, the membership of the House of Commons was increased from 670 to 707, the seats being distributed one for each 70,000 inhabitants in Great Britain, and one for each 43,000 in Ireland. It is hardly an exaggeration to describe this as the greatest of England's historic Reform Bills, for it enfranchised about 2,000,000 men and 6,000,000 women; and since only about 8,350,000 had been previously qualified to vote, the Act of 1918 almost exactly doubled the electorate.

A second reform of some importance was wrought by the Fisher Education Bills of 1917 and 1918, requiring compulsory school-attendance of children up to 14 years of age and either 280 hours of continuation schooling in the next four years or full-time education up to 16. Half-time employment in Lancashire cotton mills was prevented by a provision that children under 12 could not be employed at all and children over 12 only after school-hours to 8 P. M. Public elementary and continuation schools were to be free; the pay of teachers was increased; and a new system of grants or subsidies for secondary schools was established. These reforms added almost £15,000,000 sterling to the budget, but they corrected educational deficiencies which had long been deplored.

Lloyd George also endeavored to solve the Irish problem in this same busy period. In May, 1917, he addressed letters to Redmond and Carson, offering immediate Home Rule for southern Ireland, a five-year exclusion for the Ulster counties, and a joint council of "delegations" for all Ireland; as an alternative, he suggested that an Irish convention be asked to submit a better plan. The latter course was chosen, and on July 25 the Convention met at Dublin. Representative leaders of various parties and interests were nominated to participate. The Sinn Féin party, however, scornfully ab-

sented itself from a body which it regarded as misrepresentative and undemocratic. Without Sinn Féin, the Convention could hardly claim to speak for Ireland; nevertheless it drew up a report which was issued in April, 1918, and ignored by the British government as well as by Irish parties. See IRELAND.

The broader aspects of imperial statesmanship likewise challenged attention. Soon after the Lloyd George Cabinet was formed, the Colonial Secretary (Long) cabled to the premiers of the self-governing dominions an invitation to attend an imperial war conference. In March, 1917, the so-called Imperial War Cabinet began a series of sessions; it comprised the premiers of Canada, South Africa, New Zealand, Newfoundland, and Australia (Hughes of Australia arriving late), and the Secretary of State for India, together with the British War Cabinet. At the conclusion of the sittings, in May, Lloyd George said the experiment had been so successful that he proposed to make it a regular annual affair. True to his word, he convened the Imperial War Cabinet for a second session in the summer of 1918. In this way he hoped to solve the much-discussed problem of giving the dominions some voice in shaping imperial policy, without plunging into the difficulties inherent in any federal parliament. Side by side with the Imperial War Cabinet, in each of the years 1917 and 1918, there met in London an Imperial Conference, embracing a wider colonial representation, under the presidency of the Colonial Secretary. The effect of these conferences was not only to knit more closely the bonds of imperial political loyalty, but also to reinforce the tendency toward imperial economic solidarity, involving, for the mother country, abandonment of the traditional free trade dogmas. Even before the conference of 1917, a committee on commercial policy headed by Lord Balfour of Burleigh had recommended, in February, 1917, the establishment of additional customs duties, with colonial preference and artificial stimulation of colonial production. The Conference of 1918 recommended measures to control raw materials, especially minerals, and to safeguard essential industries. At its conclusion, Bonar Law, Unionist leader, boasted that the principle of imperial preference was at last established. Even without this boast, it was clear enough that in forming a cabinet in which Unionists predominated, a cabinet dependent chiefly on Unionist votes in the Commons, Lloyd George had made defense of the Liberal free trade principle against Unionist protectionism difficult if not impossible. (See BRITISH EMPIRE.) It may be added in this connection that the Lloyd George government, desirous of conciliating India, permitted India nominally to participate in the Imperial War Cabinet and Imperial Conference, allowed India also to establish a protective customs duty on cotton, and permitted the Secretary of State for India, Mr. Montagu, in collaboration with the viceroy, Lord Chelmsford, to draft a scheme of Indian self-government which, inadequate as it might appear to Indian Nationalists, was scarcely less than revolutionary from the Downing Street viewpoint. See INDIA.

Several important ministerial changes in the period 1917-18 should be noted in passing. An investigating committee's report on General Townshend's ill-starred Mesopotamian campaign revealed such serious mismanagement on

the part of the Indian government that in July, 1917, Chamberlain resigned the Secretaryship for India, was replaced by Montagu, but reentered the cabinet in 1918 without portfolio, later to become Chancellor of the Exchequer. Lord Rhondda, replacing Lord Devonport as food controller in midsummer, 1917, instituted more drastic regulation of prices, and ration cards; at his death in July, 1918, the office was passed on to a Laborite, Clynes. Churchill, who had been serving in the field as a major in the Grenadier Guards since resignation from the Asquith Cabinet, was recalled to become Minister of Munitions in July, 1917. General Smuts of South Africa, a statesman of recognized imperial calibre, became a member of the War Cabinet about the same time. Sir Auckland Geddes, as Director of National Service, George Barnes, as Labor's representative in the War Cabinet, Sir Eric Geddes as First Lord of the Admiralty, Dr. Addison as Minister of Reconstruction, Hayes Fisher as President of the Local Government Board, John Hodge for Pensions, and George Roberts for Labor, were also appointed in the summer of 1917. In April, 1918, when the Germans were making their supreme effort in France, the able Lord Milner assumed the portfolio of War, leaving his seat in the War Cabinet to Mr. Austen Chamberlain; and Sir William Weir became Air Minister.

Victory and Diplomacy. Meanwhile the exhausting conflict which had convulsed the world since 1914 was being pushed to a successful conclusion, thanks in no small part to the energy of the British people. Although at the outset Great Britain had sent only five divisions to France, during the entire War the United Kingdom enlisted 6,211,427 men, of whom 743,702 were killed and 1,693,262 wounded; the other parts of the Empire had supplied 3,284,943 men, of whom 202,321 were killed and 428,644 wounded. For the United Kingdom alone, the proportion of men mobilized to total population was 13.6 as compared with 17.9 for France, 11.3 for Italy, and 5.2 for the United States. British expenditures during the War amounted to about £9,000,000,000 sterling, of which £2,730,000,000 were obtained by heroic self-taxation, about £1,360,000,000 by foreign borrowing, mainly from the United States, and the remainder, more than half, by floating war loans at home. Some £453,000,000 had been loaned to France, £382,000,000 to Italy, £659,000,000 to other Allies, and £150,000,000 to British dominions. The British national debt was over £7,000,000,000 sterling at the close of the War, 10 times its amount in 1914. Furthermore, while British armies fought in Picardy and Flanders, in Gallipoli and Macedonia, in Palestine and Mesopotamia, and in Africa, the British navy had policed the high seas, safeguarding supplies of troops and matériel, and slowly starving the enemy. British propaganda and diplomacy had been influential in bringing the United States and other neutrals into the War and in preserving Allied solidarity. No statesman of the Entente was more determined than Lloyd George to fight "to the finish," and to coordinate the military efforts of the Allies. At the Rapallo Conference in 1917 he succeeded in having a Supreme War Council of the Allies established, but even this was insufficient, as he said in his sensational luncheon speech at Paris in November. After Clemenceau, a

kindred spirit, became French premier, he and Lloyd George were able to strengthen the Council, including staff officers in its membership, despite the opposition of Sir William Robertson, British chief of staff, who resigned in protest. The credit of achieving a united command and making Marshal Foch generalissimo has been claimed for Clemenceau, Painlevé, Milner, Haig, and others, but to the English Premier certainly a large share must be assigned when all the evidence has been taken.

Hardly had the booming of the great guns ceased when the opening salvos of an electoral campaign were fired in England. The War Parliament, elected in December, 1910, should normally have expired in December, 1915, but it had been kept alive by successive prolongations during the emergency, until a general election could be held in peace; it dissolved a fortnight after the Armistice. At last on Dec. 14, 1918, the long-postponed election was held; a "khaki election" it has been called, because, occurring a month after the Armistice, while millions were still in uniform, it was essentially a war election in spirit. The Prime Minister, hoping to obtain an overwhelming nonpartisan backing on the issue of patriotism before he entered the Peace Conference, joined with the Unionist leader, Bonar Law, in an appeal for electoral support of the Coalition and preservation of national unity in the peace negotiations. Their electoral promises, official and quasi-official, were lavish: to hang the Kaiser, obtain a bounteous indemnity (a figure exceeding \$100,000,000,000 was popularly mentioned), create a League of Nations, reduce armaments, foster agriculture, care for veterans, give tariff preference to colonies, protect "key industries," solve the Irish question without coercing Ulster, grant partial self-government to India, and reform the House of Lords. On this platform the Coalition won a sweeping victory; 478 loyal supporters were elected to sit on the government side of the House, against a heterogeneous Opposition of 229 members. The Labor party, having seceded from the Coalition and increased its strength from 42 (in December, 1910) to 63, became the official Opposition. Asquith's forlorn contingent of 28 "Independent Liberals" also opposed the government and hoped for better times. From Ireland came 25 Unionists and only seven Nationalists, since 73 seats, almost three-quarters of the Irish quota, had been captured by Sinn Féin irreconcilables, who refused to sit in the Westminster Parliament (see IRELAND). On the morrow of the elections, the premier reorganized his ministry by transferring the Exchequer from Bonar Law to Austen Chamberlain, the Colonial Office to the indispensable Lord Milner, the Admiralty to Walter Long, War and Air to Churchill, who was still criticized for the Dardanelles disaster, Labor to Sir Robert Horne, Supply (previously Munitions) to Lord Inverforth (formerly Andrew Weir), Ways and Communications to Sir Eric Geddes, and the post of Attorney General to Lord Birkenhead (Sir Frederick Smith). The normal practice of full cabinet sittings was not resumed until October, 1919, after the Peace Treaty was signed.

Strong in the knowledge of his secure majority—nay, spurred on by his ultrapatriotic parliamentary supporters—Premier Lloyd George entered the Paris Peace Conference of 1919 prepared to obtain Britain's full share of the

fruits of victory. Forgotten now was his celebrated war-aims declaration of Jan. 5, 1918, in which, largely to conciliate Labor, he had promised that self-determination would be applied to the German colonies, and "their exploitation for the benefit of European capitalists or governments" prevented; that "reparation" should not cover an attempt to recover war costs; that the European settlement should be based on consent of the governed; that an international organization should be established to limit armaments and prevent wars. At Paris in 1919 his primary concern was to gratify the demand of British imperialists for a major share of German colonies, the demand of British taxpayers for a generous indemnity, and the demand of the British Admiralty for unrestricted sea power. After these interests were secured, he could afford to play the rôle of disinterested mediator between the French policy of *ex victis* and the Wilsonian "Fourteen Points" (so strikingly similar to his own war aims of Jan. 5, 1918). With him he took to Paris some 200 "experts" and assistants, with as many typists and clerks, a staff sufficient to fill five hotels. His own will dominating the British delegation, strictly subordinate rôles were assigned to the other British plenipotentiaries: Bonar Law, Viscount Milner, Balfour, and Barnes. (The dominions and India were separately represented. See BRITISH EMPIRE.) As the history of the Peace Conference is told elsewhere (see PEACE CONFERENCE AND TREATIES), suffice it here to summarize the successes and failures of the British delegation. The British Premier's warning that any peace ignoring Russia must be inadequate, his desire to effect an immediate limitation of armaments, his insistence on Germany's immediate or at least early entry into the League, his demand for punishment of the Kaiser and German war criminals, his proposal for an Anglo-American guarantee of French security, his belief that Germany should have "full access to raw materials and markets of the world" (inconsistent with his own earlier pronouncements) and be "put upon her legs once more"—all were either disregarded or balked. On the other hand, the British representatives did succeed in somewhat restricting French designs on the left bank of the Rhine; Lloyd George himself was responsible for the plebiscite on Upper Silesia; the mandate system, along with several other features of the League, were of British origin; the British dominions and India obtained separate votes in the Assembly, and an Englishman was appointed first Secretary General of the League. As regards special British interests, Wilson was persuaded to drop the freedom of the seas from his "Fourteen Points"; reinforced by a strong telegram in April from 370 Members of Parliament, demanding reparation for Britain, the British delegation inserted marine losses and pensions into the reparation account; by dramatic appeals from the Dominion delegates, Mr. Lloyd George frustrated President Wilson's aim of entrusting the German colonies to small powers, and obtained for South Africa a mandate over German Southwest Africa; for Australia, German Papua; for New Zealand, German Samoa; for the Empire, the phosphate island of Nauru; and for the mother country, Mesopotamia; Palestine, full ownership of Egypt and Cyprus, most of German East Africa, and parts of Togoland and Cameroon. Persia

(q.v.), moreover, and the Hedjaz (q.v.), by arrangements independent of the Peace Treaty, had become practically British protectorates. If Disraeli could boast in 1878 that he brought home peace with honor, the fiery Welshman might well have vaunted a greater victory and richer spoils in 1919.

Signature of the peace treaties brought no surcease of international problems, but the contrary. After Premier Lloyd George had returned to London in 1919 there began a series of frequent meetings of the Supreme Council and conferences with French premiers, conferences which enabled the versatile Welshman to display his statesmanship, and incidentally his golf, at many a European spa—San Remo, Boulogne-sur-Mer, Cannes, Spa, Lucerne, besides London, Paris, Genoa, Brussels. Only the barest sketch of British policy in these negotiations is here appropriate. Toward Germany, Lloyd George took a more lenient attitude than pleased French chauvinists; his desire to fix the reparation total at a moderate figure and his willingness to accept diminution or postponement of scheduled payments brought him into continual conflict with France; likewise in reopening trade relations with Russia and endeavoring to restrain the eastward course of Polish territorial greed, he collided with the pro-Polish and anti-Bolshevik Quai d'Orsay; the same Anglo-French divergence was seen in the difficult negotiations over Upper Silesia, the cession of which to Poland was urged by Paris and opposed by London; and again in the Near East the two western Powers were at odds, Britain backing the Greek adventure in Anatolia (see GREECE and TURKEY), while France covertly encouraged the Turkish Nationalists against exasperated remonstrances from London. When Premier Lloyd George in September, 1922, indiscreetly allowed publication of a manifesto not approved by his Foreign Minister (Lord Curzon), proclaiming his intention of resisting by force any attempt of Kemal's Nationalist army to occupy the Straits zone or invade Europe, the rift in the Entente was painfully clear, for France ordered her troops to offer no resistance. Great Britain seemed about to face the Turks alone, and although an armistice was soon arranged, the British premier's precipitate and perhaps high-handed action was resented not only across the Channel, but still more keenly in England, where it was seized on by his critics as a major reason for a change of ministry. There were other discouragements. Persia (q.v.) refused to ratify the Anglo-Persian treaty and turned to America for advice and capital. Mesopotamia (q.v.) proved rebellious and so surprisingly expensive that it became a byword in Parliament. Afghanistan (q.v.) shook off British control, negotiated with Soviet Russia, and terrified British imperialism by spreading anti-British propaganda in Asia. India (q.v.), led by Gandhi, met the Montagu-Chelmsford "reform" with "passive resistance," while actual rebellion in Egypt (q.v.) necessitated a promise of independence. Opposition by the dominions to a renewal of the Anglo-Japanese Alliance (q.v.), and by British taxpayers to the cost of naval competition with the United States, was dexterously dodged by encouraging the latter nation to take the initiative, at the Disarmament Conference in Washington in 1921-22, in proposing naval ratios and a broader Pacific pact, but a satisfactory

arrangement was achieved only at the cost of abandoning Japan, accepting, nominally at least, a naval ratio on a par with the United States, promising to restore Wei-hai-wei to China, and admitting failure to curb military, air, and submarine armaments, of France particularly. Even so, the success of this conference tempted Lloyd George to sponsor a more ambitious assembly, the Genoa Conference, in the spring of 1922, whose declared aim was the economic reconstruction of Europe. But, as the uncompromising Poincaré had just become French premier, superseding the more pliable Briand and repudiating the Anglo-French alliance project which the latter had drafted with Lloyd George, French policy at Genoa was so resolutely guided in anti-British, anti-German, and anti-Bolshevik channels that the Welshman's grandiose plans of international reconciliation and reconstruction went on the rocks, and no one except Lloyd George himself could regard the conference as more than a disheartening fiasco. The breach in the Entente Cordiale seemed irreparable at the time, and one of the arguments which ultimately overthrew the Lloyd George government was that by ill-considered opposition and by undue charity toward an undeserving Germany, the Premier had transformed a cordial understanding into irritable antagonism.

Reconstruction Problems. The four years following the Armistice presented domestic problems hardly less grave than the international questions which have been described. The cost of living soared in the first post-Armistice year to 225 per cent of its pre-war level; reaching its peak, 276 per cent, in October, 1920, it subsided only gradually to 195 per cent in November, 1921, and 181 per cent in April, 1922. The percentage of trade union members unemployed was 2.4 at the beginning of 1919, but instead of decreasing, it rose to 6 before the end of 1920, attained the alarming level of 23.1 in June, 1921, and was still over 16 at the beginning of 1922. The actual number unemployed in January, 1921, was 1,060,000; in July, 1921, it was 2,170,000, plus 988,000 on short time; in March, 1923, it was 1,300,000. If figures can ever be eloquent, these must tell a tragic story of privation and hunger, of silent factories and bankrupt industrialists, of idle workmen and pauperized families losing their morale with their hope. A palliative, not a remedy, was provided by the Unemployment Insurance Bill which the Lloyd George government introduced in December, 1919, and promulgated the following August, extending previous laws, and granting benefits of 15 shillings a week for involuntarily unemployed men, 12 shillings for women, for a maximum of 15 weeks a year. The very genuine hardships of unemployment and high prices made industrial unrest inevitable; and the stimulus which the Russian Revolution and Socialist parliamentary victories on the Continent gave to all labor movements was not without effect in England. In vain the government conceded an eight-hour day to railwaymen; in vain it enacted a law restoring trade practices; in vain it convened an Industrial Conference (February, 1919) of employers and workers, and set the Sankey Commission to investigating coal miners' grievances. In Parliament, the Labor Opposition was implacable; outside Parliament, strikes multiplied. A railway strike in the fall of

1919, ominous though it appeared, was settled in 10 days. Of longer duration and graver import were the coal strikes. After the Armistice the miners demanded a six-hour day, a 30 per cent wage increase, and nationalization of the mines. Though the Sankey Commission effected a truce, wage increases being granted and a Department of Mines established, the miners by a fortnight's strike in October, 1920, gained a further increase, and again went on strike for three months in the spring of 1921. The government survived these and similar disturbances, but more than once there seemed a likelihood that by direct action the so-called "Triple Alliance" of miners', railwaymen's, and transport workers' unions would use their control of vital industries as a weapon with which to coerce the government and enforce the demand of radicals for nationalization of mines and communications.

The increased wages of government employees, the staggering burden of unemployment insurance, the costly endeavors of the administration to relieve the grave housing shortage, the miscellaneous measures of social legislation designed to ease the pains of reconstruction, and the continuance of huge military and naval expenditures made it necessary to increase rather than diminish the weight of war taxation in 1919 and 1920, and though some reductions were made in 1921-22, taxpayers yearned for relief, and many hoped that a less ambitious premier might also be less extravagant.

While the stormclouds of political opposition were gathering on Lloyd George's horizon, he accomplished one more of the feats of political dexterity which had earned him the not altogether complimentary soubriquet of "Welsh wizard." His earlier attempts to solve the Irish question during the War had simply made matters worse in that distracted island. Sinn Féin, having won the 1918 elections, had proclaimed an independent republic and inaugurated a guerrilla war against the British army of occupation. As repressive decrees and reprisals seemed but to add fuel to the conflagration, the Lloyd George government in February, 1920, introduced, and in December carried, a Home Rule Bill to create two parliaments, one at Dublin and the other at Belfast, and a joint council for Ireland, with decidedly limited powers of self-government. Regardless of Sinn Féin indignation, Lloyd George endeavored in 1921 to put this law into effect, and succeeded easily in establishing the Belfast Parliament, but utterly failed in southern Ireland. Undismayed by this check, he now suddenly altered his tactics, invited the Sinn Féin leaders and the Ulster premier to a three-cornered peace conference in London, and on Dec. 6, 1921, signed an epoch-making treaty with them, for the creation of an Irish Free State with dominion status (See IRELAND.) This political *coup de main* will probably go down in history as one of the outstanding achievements of the long Lloyd George administration; certainly it put a new complexion on the Irish problem and left critics breathless with surprise, if not admiration. But it did not long save the cabinet.

The Unionists in Power. As wartime passions cooled and the lustre of Premier Lloyd George's war services was dimmed with passing years, the Coalition Cabinet, resting on the "khaki elections" of 1918, began to totter. In by-elections up to the end of 1921 the Coalition

suffered a net loss of 13 seats. The Labor Opposition grew bolder, and Asquith began to tax the government with reckless extravagance. The Near Eastern crisis and the rift in the Entente Cordiale were set down to the Premier's imprudence. But the *coup de grâce* was administered by the Unionist party leaders who voted, in a caucus at the Carlton Club on Oct. 19, 1922, to withdraw from the Coalition. Lloyd George immediately, and somewhat indignantly, resigned his office in favor of Andrew Bonar Law, who proceeded to form a Unionist cabinet on party lines, including the Marquis of Salisbury, Viscount Cave, Stanley Baldwin (Chancellor of the Exchequer), Marquis Curzon (Foreign Affairs), the Duke of Devonshire (Colonies), Viscount Peel (India), the Earl of Derby (War), and other less known Unionists. Parliament was of course dissolved, October 26, as the Unionists had only a plurality in the Commons, and new elections were held on November 15. With their campaign slogans of "tranquillity and stability" (an English version of Harding's "noimalecy"), economy, conciliation of France, and abhorrence of one-man government, the Unionists polled 5,300,000 votes and returned 344 members to Parliament, a safe majority. Lloyd George, heading his own faction of "National Liberals" with a few Unionists who were personally loyal to him, pointed with pride to his war record, scoffed at the desire for less vigorous statesmanship, promised economy and peace, and delivered philippics against the menace of socialism, but returned to Parliament with only 56 supporters. The Asquith Liberals, adhering to traditional policies and emphasizing free trade and economy, won 60 seats. Labor, *enfant terrible* of British politics, had scandalized and terrorized the older parties by advocating a socialistic capital levy, taxation of land values, nationalization of mines and railways, increased old age pensions and unemployment doles, and a radical foreign policy; to the confusion of overly sanguine prophets, Labor failed to win a majority, although it did increase its delegation to 138 and polled 4,102,000 votes (as many as the two Liberal factions combined). It will be noted that, with the addition of minor groups, the total is only 615; to this figure the Commons was reduced in 1922, by excluding representatives from southern Ireland, but retaining 15 from northern Ireland.

With a safe majority of more than 100 votes (including some National Liberals), the Unionist government proceeded first to fulfill a campaign pledge, the enactment of a Constituent Act and a Consequent Provision Act, giving effect to Lloyd George's Irish treaty (see IRELAND); their promulgation on Dec 5, 1922, accomplished England's part of the bargain. When, after the holiday recess, Parliament reassembled in February, 1923, Liberal and Labor opposition relative to the Ruhr and to Mesopotamia was crushed by the ministerial steamroller, and Parliament was plunged into budgetary calculations, made more acceptable by a reduction of sixpence in the pound on the income tax and by other tax cuts all along the line. Business was interrupted in May by Premier Bonar Law's resignation, occasioned by sickness which soon afterward caused his death (Oct. 30, 1923). His successor, Stanley Baldwin, a former business man, had earned golden opinions by his tactful negotiations in Washing-

ton for deferred payment of the British debt to the United States at reduced interest, and by his conduct of the exchequer in the preceding cabinet. Moreover, he was known to hold opinions unfavorable to French policy in the Ruhr. Retaining most of the old cabinet, Baldwin entrusted the Privy Seal to Lord Robert Cecil, who had attracted favorable attention by his statesmanlike activity in the League of Nations; Sir Samuel Hoare became Air Minister; Sir William Joynson-Hicks, financial secretary to the Treasury; and Sir Laming Worthington-Evans, Postmaster General. Subsequently the Exchequer was offered to Reginald McKenna, refused by him, and given to Neville Chamberlain, in August. Baldwin as premier found himself face to face with three major problems, all closely related. The "unemployment crisis," with 1,250,000 persons out of work five years after the Armistice, was no longer a crisis, but a chronic malady demanding remedy. The Ruhr crisis, if it could be so solved as to permit recovery of the German market, might help solve the unemployment problem, but Poincaré was adamant to Baldwin's arguments. The third problem, preferential tariff protection, was proposed by the Imperial Conference of October, 1923 (see BRITISH EMPIRE), as a remedy for industrial depression, but it proved Premier Baldwin's undoing. As Law had pledged his cabinet not to tamper with the tariff before the next election, Baldwin honorably but imprudently dissolved Parliament, Nov. 16, 1923, and ordered general elections, December 6. His party, fighting for tariff reform, polled as many votes as in 1922 but elected only 259 members. The reunited Liberals, defending Free Trade, polled 4,217,000 votes and increased their representation from 117 to 155. Labor, opposing protectionism and proposing a modified capital levy, along with other moderately socialist measures, increased its poll to 4,338,000 votes and its parliamentary representation to 191. Thus no party commanded a majority. Instead of resigning at once, in response to the adverse referendum, Premier Baldwin waited for the new Parliament, which assembled in January, 1924, to oust him. His fate was decided by Asquith, who as leader of the reunited Liberals held the balance of power, and who concluded that the uncertainties of a Labor government were preferable to the "confusion, vacillation, and impotence" of the Unionists. Joining forces with Labor, then, he helped vote Baldwin out, the vote being 328 to 256.

Labor in Power. James Ramsay Macdonald, veteran Labor leader, ostracized as a pacifist in the War but welcomed back to the fold in less patriotic post-bellum days, now formed a Labor cabinet, in which he took the difficult portfolio of foreign affairs, and in which were included J. R. Clynes, former textile worker, as Lord Privy Seal and leader of the Commons; Philip Snowden, former clerk, ardent pacifist and moderate socialist, as Chancellor of the Exchequer; Arthur Henderson, former iron worker, as Home Secretary; J. H. Thomas, a Welsh trade unionist, as Colonial Secretary; William Adamson, a miner, as Secretary for Scotland; Stephen Walsh, coal miner, as War Secretary; Noel Buxton, an ex-Liberal of private fortune, as Minister of Agriculture; Sir Sidney Oliver, former colonial official and Fabian socialist, as Secretary for India, with a peerage; Brig-Gen. C. B. Thomson, one of the ablest and

youngest generals, a recent convert to Labor, as Secretary for Air, with a peerage; Sidney Webb, eminent historian of trade unionism, as President of the Board of Trade; Lord Parmoor as President of the Council, Viscount Chelmsford, Conservative, for the Admiralty; John Wheatley, Health; C. P. Trevelyan, ex-Liberal, pacifist, recent convert to Labor, son of the distinguished historian, as President of the Board of Education; Thomas Shaw, prominent socialist, as Minister of Labor; Col. Josiah Wedgwood, for the duchy; and F. W. Jowett, for Works. Though a few opponents, notably Winston Churchill, vainly endeavored to arouse the country to the peril of a Socialist ministry, Premier Macdonald showed no inclination toward revolutionary fanaticism, but, rather, accepting the traditions of office, amiably visited the King, respected venerable ceremonials, and conducted his policy with irreproachable sobriety. His plans for more generous unemployment relief (which had cost the exchequer £170,000,000 since the Armistice) and for construction of 200,000 houses a year, to rent at 9 shillings a week each, were but extensions of established policies. The capital levy, Labor's most radical campaign proposal, was practically dropped; indeed, Premier Macdonald calmly permitted the bourgeois parties on April 1 to pass, by 325 to 160 votes, a resolution condemning the principle. In the budget presented by the Socialist Chancellor of the Exchequer, April 29, there was provision for a reduction of £40,000,000, lowered duties on tea, sugar, and coffee, discontinuance of duties on imported automobiles and films, repeal of the corporation tax, and inhabited house taxes; but not even Churchill could make social revolution out of these items. In foreign affairs Premier Macdonald displayed a refreshing candor, coupled with frank pacifism and confessed regard for British interests. With Poincaré he exchanged letters which on his side uttered bluntly England's objections to French armament and Ruhr policies, but also expressed a transparently sincere desire for reconciliation and cooperation. He abruptly granted recognition to Soviet Russia, February 2, for commercial reasons, as he said, though Bolshevism was repugnant to him. He announced on March 18 that he would stop fortification of the Singapore naval base, as a pacific gesture; but he insisted on customary naval appropriations. All treaties, his government promised, were henceforth to be submitted publicly to Parliament. In short, his was a moderately radical, conservatively pacifist, course of action, dictated by evolutionary socialism rather than revolutionary communism, and scarcely more perturbing to "tranquillity and stability" than the pre-war social reforms of an Asquith cabinet, for all its tremulous dignity, or the dazzling political legerdemain of a Welsh wizard, or the quietist *fainéance* of a Bonar Law, or the disconcerting protectionism of a Baldwin "business" government, all of which had been tried and found wanting in 10 memorable years.

GREAT BRITAIN, COMMUNIST PARTY OF. See COMMUNISM.

GREAT LAKES, COMMERCE OF. See SAULT SAINTE MARIE.

GREBLE, EDWIN ST. JOHN (1859-). An American soldier, born at West Point, N. Y., and educated at the United States Military Academy. He was appointed second lieutenant.

During the Spanish-American War he served as captain and as assistant adjutant-general of volunteers and in 1899 was promoted to be major of volunteers. In the same year he was appointed captain of the Regular Army and was successively promoted to be major, lieutenant-colonel, colonel, and in 1916 brigadier-general. In the following year he became major-general. During the American administration of Cuba, he served as assistant to General Ludlow and to General Wood. From 1910 to 1914 he was a member of the General Staff in charge of field artillery and commanded the 6th Field Artillery on the Mexican border, from 1914 to 1916. In 1918 he was retired on account of disability incurred in active service.

GREECE. A republic in southeastern Europe. The Glücksburg dynasty was deposed on Apr. 13, 1924. The area is about 49,000 square miles, according to the boundaries fixed by the treaty signed at Lausanne, July 24, 1923. This area includes Old Greece, Thrace (west of the Maritza River), and the islands, with the exception of the Dodecanese, which belong to Italy, and Imbros and Tenedos, which now belong to Turkey. The population in 1924 was about 6,500,000, including 1,500,000 refugees from Turkey in Asia and Eastern Thrace. The area in 1914 was 41,933 square miles; the population, 4,363,000. Most of the population belonged to the Greek race. There were some Albanians, Jews, Vlacks, Slavs, and Armenians. The great majority of the inhabitants were adherents of the Greek Orthodox church, which, by the terms of the constitution of 1864, was declared the religion of the state. Complete toleration and liberty of worship were guaranteed to all other sects, the greater part of whom were Roman Catholics and Jews. Emigration, especially to the United States, was 38,644 during 1912-13. It decreased considerably during 1922 and 1923, partly because of the restrictions on immigration by the United States government. The principal cities of Greece are Athens, with 211,000 inhabitants; Saloniki, 154,000; Piræus, 97,000; Patras, 31,000; Corfu, 29,000; Hermoupolis, 23,000; Heraclium, 25,000; Volos, 24,000; Canea, 24,000; Kalamata, 20,000; Cavalla, 19,000.

Agriculture. Greece is mainly an agricultural country, with four classes of land proprietors: large land owners; peasant proprietors; monastic institutions; and the government. The large land owners were proprietors of one or more villages, with the adjoining land. Their estates varied in size from 2000 to 15,000 acres. There were very few of these large estates left, however, by 1924. Peasant proprietors owned from 25 to 150 acres each. The land belonging to monasteries was farmed chiefly by the monks. Government lands were mostly uncultivated and consisted chiefly of forests, marshes, and mountain pastures. During 1923-24 many refugees were given government lands and government loans large enough for them to build their houses and buy implements and seeds for their crops. The principal crops, in addition to cereals, were currants, tobacco, olives, and figs. The principal cereals grown were wheat, barley, oats, rye, and corn. The area planted to wheat in 1923 was 1,071,000 acres, with a production of 13,359,000 bushels; oats, area, 180,000 acres, production, 5,994,000 bushels; rye, area, 217,000 acres, production, 2,679,000 bushels; corn,

in 1921 (the last year for which figures were available), area, 494,000 acres, production, 7,880,000 bushels. Greece did not raise enough cereals for local requirements and had to import large quantities. A large amount of wheat, principally from Canada, the United States, and Bulgaria, was imported in 1922, barley, principally from Rumania and Egypt, corn, from Rumania and Bulgaria; flour, from Egypt and the United States (the flour from Egypt was probably reexported); rice, from the United States, Italy, and Egypt. The principal crops for export were currants, tobacco, olives, and figs. During 1923, there were 186,000 acres planted to currants, with an approximate production of 104,000 short tons. Currants exported during 1922 amounted to 80,000 short tons, principally to the United Kingdom, the United States, and the Netherlands. During 1920 (the latest figures available) 105,000 acres were planted to tobacco, with a production of 37,000 short tons. The tobacco crop for 1923 amounted to 71,000 short tons. Exports of tobacco during 1922 amounted to 106,000 short tons, chiefly to Germany and Egypt. The production of olive oil in Greece for 1923 amounted to 17,000,000 gallons. Exports of olive oil during 1922 amounted to 18,000 short tons, mostly to Italy, France, Turkey, and the United States. The fig crop for 1923 was 94,000 short tons. Fig exports during 1922 amounted to 12,000 short tons, chiefly to the United States, Italy, and the United Kingdom. Over 400 tons of cheese were exported during 1922. Besides currants and figs, Greece produced, in 1922, 152,000,000 oranges, 63,000,000 mandarins, and 49,000,000 lemons. The estimated numbers of live stock in Greece at the end of 1923 were 250,000 horses, 140,000 mules; 310,000 asses; 1,000,000 cattle; 7,500,000 sheep; 5,500,000 goats; and 460,000 swine. The forested area was nearly 4,000,000 acres. The principal trees were oak, beech, Aleppo pine, and silver fir.

Mining. Greece possessed a great variety of mineral deposits, the most important of which were salt, lignite, iron, magnesite, iron pyrites, and santorin earth. The production of these metals during 1922 (the last figures available) was as follows: emery, 13,000 metric tons; salt, 68,000; lignite, 132,000; iron, 49,000; magnesite, 57,000; iron pyrites, 55,000; and santorin earth, 28,000.

Manufacturing. Industry, after the War, was making considerable progress in Greece, especially in the manufacture of foodstuffs, leather, textiles, and soap. A number of émigrés from Turkey, who were skilled in the carpet and rug industry, practically denuded that field in Turkey and added this industry to those already practiced in Greece. Industrial concerns at the close of 1923 numbered 3512 and were distributed as follows: foodstuffs, 2000, leather, 450; chemical, 200; wood, 200; paper and printing, 150; mechanical, 150, housing, 150; textile, 125; tobacco (privately owned), 60, electrical, 25, and metallurgical, 2. The relations existing between employers and employees were amicable and it was only during recent years that trade unionism made any headway. To these unions women were admitted. Until recently strikes were practically unknown. Several occurred during 1923, especially on the electric railways. Legislation was passed during 1919-24 dealing with workmen's compensation, inspection of mines and factories,

hours of labor, employment of women and children, etc.

Cost of Living. The cost of living in Greece, as was the case in the majority of other countries of eastern Europe, increased rapidly after 1914. The index of the cost of living (1914 as 100) rose as follows: 1915, 121; 1916, 167; 1917, 289; 1918, 382; 1919, 341, 1920, 359; 1921, 421; 1922, 778; 1923, 1213; January, 1924, 1325.

Commerce. The total value in dollars of imports into Greece and exports from Greece during 1912-13 (average), 1921, and 1922, was as follows:

	Imports	Exports	Total
1912-1913 (average) ..	\$32,385,000	\$25,589,000	\$57,974,000
1921 . . .	100,792,000	55,357,000	156,149,000
1922 . . .	101,636,000	81,859,000	183,495,000

Conversions for the above table were made in drachmas at par for 1912-13 (\$0 193); for 1921, 1 drachma = \$0 0592; 1922, 1 drachma = \$0 033. The trade balance of Greece was generally adverse. The main sources of revenue to offset the excess of imports over exports during the period were the expenditures of the Allies' armies during the War, foreign investments in public utilities, mining, and agricultural enterprises, tourists' expenditures, emigrants' remittances, and government borrowings. The principal imports into Greece were agricultural products, textiles, and minerals and metals, including machinery and agricultural implements. The principal exports were agricultural products, mainly tobacco, currants, olives, raisins, and citrus fruit; minerals and metals, raw; alcoholic drinks, and olive oil. The principal countries selling to Greece during 1922 were the United States, the United Kingdom, Italy, France, Germany, and Egypt. The principal countries receiving exports from Greece were the United States, Germany, the United Kingdom, Italy, the Netherlands, France, and Egypt.

Communications. The length of railways in 1923 was about 1700 miles; 75 per cent of this was standard gauge. Most of the railroads were state-owned. The number of locomotives during 1922 was 262; passenger cars, 677; and freight, 4913. There were 10,600 miles of telegraph line in 1923; 22,325 miles of wire; 550 offices. 3973 miles of cable in 1920, total telegrams (1922), 4,294,662; miles of telephone line (1920), 4914. The Greek Merchant Marine in 1923 consisted of 1522 vessels, with a gross tonnage of 914,136. Shipping entering Greek ports in 1921 totaled 3963 vessels of 4,274,915 tons; cleared, 3898 vessels of 3,805,112 tons.

Finance. Gold and silver stock on hand in November, 1923, was 37,330,000 francs, which did not include 25,000,000 francs in the Bank of England. The banknote circulation at the end of 1913 was 245,893,000 drachmas. This increased to 1,909,638,000 drachmas in 1920; 2,507,638,000 in 1921; 3,099,141,000 in 1922, and stood at 5,406,036,000 at the end of December, 1923. The total external debt of Greece, according to official government statistics on Dec 31, 1923, was 1,644,270,000 gold drachmas (\$317,334,110 converted at par). The total internal debt on the same date was 7,761,000,000 drachmas (\$131,937,000 converted at the average exchange value of the drachma for 1923, \$0.017). A little over half of this in-

ternal debt bore interest. The total budgeted revenues, ordinary and extraordinary, during 1922-23, other than paper money issues, was \$141,881,000; expenditures, \$160,467,000. The total anticipated revenues for 1923-24 were \$67,000,000, and the total expenditures, \$112,608,000.

Education. According to the latest census, 1917-18, there were 6799 primary schools, with 8641 teachers and 476,695 pupils; 76 high schools; and 425 middle schools, having 55,408 pupils. In 1921, there were 10,131 teachers in elementary schools and 2,018 in secondary schools, and two agricultural schools with 150 students. There were two universities in Athens, the National University and the Capodistria University, as well as the Polytechnic with 22 professors and 170 students, and 17 commercial schools with 2800 students. There was an American School of Archaeology at Athens and a British School of Archaeology.

History. At the outbreak of the War the Greek ruling class vacillated between two opinions. King Constantine (q.v.) favored union with the German cause or at least a policy of neutrality; Venizelos, who had been premier since 1910, saw in an espousal of the Allies' purposes the realization of the long desired expansion in Northern Epirus (q.v.), as well as the possible acquisition of territories in Asia Minor at the expense of Turkey. But the fear of Bulgarian participation stayed Venizelos's hand, while the known sympathies of the King and the well timed German propaganda, which kept the population eager for peace, contributed toward the maintenance of Greek neutrality. To Venizelos, the attack on the Dardanelles in February, 1915, seemed an auspicious occasion for the Greeks to throw their support definitely on the side of the Allies; but the King persisted in his opposition, with the result that Venizelos was forced out of office and the Chamber dissolved. A new ministry, under Gounaris, was constituted frankly on a neutral basis, and though the Venizelists won a clear majority in the elections of June, 1915, on the issue of intervention, it remained in power to the complete disregard of the principle of ministerial responsibility. Only on August 23 was Venizelos summoned to the palace. His foreign policy centred in the maintenance of the Græco-Serbian accord, and he continually proclaimed to the Allies and Germany that a Bulgarian attack on Serbia would be followed by hostilities. With Bulgarian mobilization in September, Greece, so far as Venizelos was concerned, was ready for war. The Allies were requested to supply the 150,000 men necessary for the protection of the Græco-Serbian frontier, and Greece stood prepared to meet her obligations. But the King stubbornly refused to countenance a war declaration, and aided by the general staff, which owed its German sympathies to its German military training, he frustrated any attempts to succor Serbia. The French troops were refused a landing at Saloniki: in October, Venizelos was once more dismissed in spite of the fact that he commanded a majority. The succeeding events seemed to indicate that the King and not Venizelos was to triumph. Under the Zaimis and Skouloudis ministries the Græco-Serbian treaty was repudiated and aid to the Allies refused in spite of the tempting offer of the cession of Cyprus. The King was determined to break the Venizelist opposition and once more called for a general election. In

the balloting of December 19, as a result of the abstention of Venizelos and his followers from the polls, the government was accorded the confidence of the electorate and persisted, therefore, in its policy of neutrality.

Whether it willed or no, Greece was to serve the Allies' purposes. In December, 1915, an Allied force under General Sarraill took possession of Saloniki, and that city served throughout the War as the seat of the Allies' operations in southeastern Europe. On June 3, 1916, martial law was proclaimed in the city, from June 21 on, when the Allies demanded of Constantine the demobilization of the army and the calling of a general election, the French and English played an increasingly important rôle in Greek affairs. Greek protests to the United States were unavailing. A blockade was enforced, the right of search exercised, and the import of food seriously curtailed. The Skouloudis ministry fell, and on June 27, the King was forced to yield to all the Allied demands. Cabinet crises followed in rapid succession amid the uncertainties of a Bulgarian invasion of Macedonia, the entry of Rumania into the War, and a growing turbulence on the part of the Venizelists, who formed revolutionary committees for the purpose of forcing intervention. In fact, prompted by this motive, Venizelos repaired to Crete in an attempt to stir up the national ardor for a common move on Bulgaria; and the agitation had all the marks of a revolutionary movement, even to the forming of a provisional government, though Venizelos continued to protest his loyalty to the dynasty. On November 24, aroused by the operations of irregular Greek bands and fearing a more general movement, Admiral du Fournet, in command of the Allies' fleet, demanded the surrender of a large portion of the Greek artillery. Greek refusal led to the occupation of the Piræus and a march on Athens. Street fighting at once became general; the Venizelists in particular were singled out for outrages. The tone of the Allies now assumed a marked severity. In the demand for reparations the following points were stressed: withdrawal of Greek troops to the Peloponnesus, where, of course, they could be watched; the dispersal of armed bands of reservists; the release of political prisoners; the reestablishment of Allied control over means of communication. A rigorous blockade was set up and the Venizelist provisional government at Saloniki was recognized. On Jan. 16, 1917, the Greek government accepted the terms; on January 13 it complied with the terms of another ultimatum, though the blockade continued in force. The nonappearance of a German army in Macedonia, the entry of the United States into the War, and the displacement of Briand by the more truculent Ribot as the head of the French government, all contributed toward the creation of a more docile royal policy. But with or without official knowledge, the reservists continued to operate and by uniting with German agents in Thessaly succeeded in seriously embarrassing the Allies' purposes. Once more the Allies coerced Greece, this time at the instance of powerful French opinion. On June 6, Jonnart made his appearance at Saloniki as commissioner for Great Britain, France, and Italy, and at once despatched a note to Constantine demanding his abdication as well as that of his oldest son. On June 12 the King gave in and designated his second son, Alexander, as ruler

of the country. Known German sympathizers were banished; the ministry in power resigned; and on June 27 Venizelos was called to head a new government. Thus a revolution was effected by Allied intervention, though it is possible that Venizelos had he gained the consent of the Entente, would have brought about the same end, for his adherents at this time numbered some 50,000.

On June 30, Greece broke off diplomatic relations with the Central Powers and formally entered the War on the side of the Allies. The Chamber of June, 1915, was summoned, and after a vote of confidence had been given the governments, steps were taken to put the country on a military footing. As a result of mobilization, some 250,000 men were called to the colors and under the direction of the French General Braquet were whipped into fighting shape so rapidly that by 1918 they were able to give the Allies a great advantage on the southeastern front. By Greece's entry the domestic situation was relieved through heavy importations of grain, the restoration of a considerable number of merchant ships, and French aid in the reconstruction of the national finances.

Before the Peace Conference, Venizelos was undoubtedly the most important single eastern European figure. He pressed with vigor the Greek claims to Northern Epirus, Thrace, Smyrna, and the Dodecanese (qq.v.), and met at once with an initial success in the treaty of Neuilly. By this document western (Bulgarian) Thrace was ceded to the Allies (in trust for Greece), and Bulgaria was thus deprived of access to the Aegean. Another hope seemed well on the way to realization when Venizelos received the Allies' sanction for the despatch of a Greek force to Smyrna, nominally for the protection of the Christians (May 15, 1919). The Peace Conference looked favorably on the Greek claims to the Aegean islands and seemed disposed to grant the Greek requests for the Epirus in view of the cession of Valona to Italy by the Treaty of London of 1915. The turn in Greek fortunes came, however, late in 1920. In spite of Turkish protests, so impressed was the Supreme Council with Venizelos and his apparent hold on the Greek people that by the Treaty of Sèvres, later discredited, Greek sovereignty was extended over eastern Thrace up to 20 miles of Constantinople; Smyrna was provisionally assigned to Greece; and the islands of Tenedos and Imbros, as well as those in the Aegean Sea already occupied by Greece, were ceded. At the same time the Dodecanese, by agreement with Italy, were promised to Greece. Never did a statesman see his efforts crowned with greater success than did Venizelos when he quit the Supreme Council in the summer of 1920. Yet his long absence from home, and the high-handed character of the administration, the continuance of martial law, a drastic censorship, mobilization practically continuous since 1912, the effective pro-Constantine propaganda, and the general war weariness, contributed to his fall. The sudden death of King Alexander on October 25 at once made the return of Constantine the leading issue for the forthcoming election. In the light of the returns, the repudiation of Venizelos was complete. Of the Opposition, 246 were elected against 120 Liberals (Venizelists). Venizelos immediately retired from the country; a new ministry was formed under Rhallis; and King Constantine

returned in triumph on December 19, after receiving an almost unanimous vote in a plebiscite. It was inevitable that the Allies' attitude toward Greece, hitherto so favorable, should now be completely reversed. On December 3 the Supreme Council announced the withdrawal of all financial support to Greece. In the spring of 1921, largely at the instigation of the French, who feared for their own interests in Asia Minor as the Turkish Nationalist movement under Mustafa Kemal took on strength, the Supreme Council turned its attention toward a revision of the Treaty of Sèvres as far as Greece was affected. By March it was evident that the Supreme Council meant to repudiate the cession of Smyrna to Greece. Under these circumstances the Greeks began a war on the Nationalists on March 24 by marching on Afun-Karahissar and Eskishehr, on the line to Angora. Both cities soon fell; Eskishehr, however, was retaken on April 2 by the Turks; the first offensive thus closed without spectacular results. The war spirit in Greece reached fever pitch. Encouraged in a belief that Great Britain was actively championing their interests and that surcease from the pressing domestic problems would be found in great victories abroad, the Greeks renewed their demands for a continuance of the war. The second offensive began on June 10. A bloody battle was fought before Kutahia, July 16-17, and the Greeks occupied the town. On July 21, Eskishehr was once more entered, and the army pushed east on the road to Angora. Not until after the Greeks crossed the Sakharra in September did they receive their first check. In a 10 days' battle early in September the Greeks were disastrously defeated and were compelled to fall back with heavy losses on the earlier Brusa-Afun Karahissar line. Thus the year closed with practically no results. Meanwhile at home the newly elected Chamber had constituted itself a Constituent Assembly and was confronted by an advanced programme of political and economic reform prepared by Gounaris. It was idle to hope for any real reconstruction in view of the depletion of the treasury and the Chamber's preoccupation with the idea of indemnifying the victims of the Venizelist régime during the War. How precarious the situation was immediately became evident. With the beginning of 1922 the serious nature of affairs, little known at home and abroad because of a continuous official mendacity, began to appear. Turkish attacks on Greeks throughout western Asia Minor became frequent, and imprisonments and deaths were numerous. These atrocities were merely forerunners of the larger movements of the summer. In the last week of August the Greek army, inadequately commanded, was suddenly beset in the Afun-Karahissar and Eskishehr districts by an immeasurably superior Turkish force and struck a staggering blow. Panic at once ensued. Flight toward Smyrna was general, while thousands of soldiers took to their ships and made for Greece. The city of Smyrna, filled with refugees, was turned over to the Allies on September 8 and was entered by the Turks three days later. On September 14 a fire broke out in the foreign quarter and destroyed the whole section on the water front; some 100,000 were left homeless. Thus, in 15 days, the Turks had swept Anatolia free of the invaders and restored a balance that for more than a year had

seemed all but lost. The Greeks were compelled to evacuate eastern Thrace as a condition for an armistice. The reaction on home affairs was instantaneous. Beginning in the islands of Mytilene and Chios and spreading to the fleet and the soldiers in Thrace and Macedonia, the demand for Constantine's abdication gained such headway that on September 27 the King once more relinquished his throne, this time in favor of his oldest son, George. Constantine died suddenly at Palermo on Jan. 11, 1923. Until the meeting of the new National Assembly affairs were in the hands of a revolutionary committee which, in order to gain popular approval, proceeded to an investigation of the late disaster. A report published on November 8 condemned all the anti-Venizelist governments from 1915 to 1922 and demanded the indictment of the ex-ministers, Gounaris, Stratos, Protopapadakis, Theotokis, Baltazzis, Goudas, and Stratigos, on a charge of treason. A speedy trial took place, and the following, to the horror of Europe, were sentenced to death and duly executed: Gounaris, Stratos, Protopapadakis, Theotokis, Baltazzis, and General Hadjianastis, commander of the forces in Asia Minor. Such an act only strengthened the hand of the French diplomats who sought to pacify Turkey at the expense of Greece. The Treaty of Lausanne, as finally signed on July 24, 1923, (see TURKEY) meant the complete humiliation of Greece and the dissipation of those hopes of a greater Greece dominating the Southeast which had been the dream of politicians since the outbreak of the War. Eastern Thrace, Smyrna, the Dodecanese, were lost; those Greek nationals, some 600,000 living in Turkish territory, notably in Asia Minor, whose commercial activities added much to the wealth of the fatherland, were to be torn from their homes and settled lives and deported to Greece, in exchange for Turkish nationals. A further blow was struck at Greek prestige when on August 29 as a result of the murder, at Janina, two days earlier, of the Italian commissioners who had been at work on the delimitation of the Græco-Albanian boundary, Mussolini, presuming Greek responsibility, delivered an ultimatum to Greece which demanded official apologies, execution of the unknown murderers, and the immediate payment of 50,000,000 lire. The refusal of Greece to pay so large a sum at once led to the Italian bombardment and occupation of the island of Corfu, August 31. Greece thereon appealed to the League Council, under Articles XII and XV of the Covenant. Expressions of disapprobation in the Assembly and Council of the League, and, above all, English intercession for Greece, induced Mussolini to abandon his truculent attitude, accept terms of settlement proposed by the Council of Ambassadors, and withdraw from Corfu. Greece accepted the terms on September 9 and shortly thereafter made the required ceremonial apologies, besides depositing 50,000,000 lire as a forfeit, which was turned over to Italy after an impartial commission had reported that although not responsible for the murders, the Greek government had been negligent in proceeding against the assassins. (See ALBANIA and ITALY.) International bankruptcy was merely one face of the shield; domestic affairs revealed the same deplorable breakdown. The revolutionary government, headed by Gonatas, though Colonel Plastiras was the virtual dicta-

tor, continued in control throughout 1923, maintaining its uneasy position only by the suppression of the constitutional liberties. The Venizelists, the party at the head of affairs, were hopelessly disunited; and with a lack of leadership, for both Venizelos and Zaimis were in political retirement, the country drifted helplessly. A half-hearted gesture at reconstruction was made on August 1 when the first army contingents were demobilized. In October a revolt led by General Metaxis broke out and soon spread over the Peloponnesus, and only with difficulty was the government able to cope with it. Again popular opinion seemed to consider a republican constitution a universal palliative. The weeks preceding the general election of December 16 witnessed a revival of republican sentiment; attacks on the dynasty even appeared in the army and navy, hitherto generally loyal. The elections proved favorable to the Venizelists and the republicans, two days later George and his wife Elizabeth were invited to leave the country, and a regent, Admiral Koundouriotis, was installed in the palace. The year 1924 thus saw Greece again about to commence a new and perilous journey. The Glücksburg dynasty was deposed, only temporarily, it was claimed, but quite definitely so far as public opinion was concerned; a National Assembly convened on January 2; and on January 4, Venizelos, the man to whom all Greece looked, appeared in Athens after an exile of three years and consented first to head the National Assembly and then, on the resignation of the Gonatas cabinet, the government itself, on January 11. To Great Britain and the United States the new régime appeared to possess all the elements of stability, and recognition was formally accorded during the course of the month. But it seemed that Greece's well-wishers were to be doomed to eternal disappointment and that despair was to be the lot of those Greeks who were laboring to save their country from chaos. Venizelos was forced to relinquish his post because of illness, and although a cabinet completely made up of Venizelists succeeded him on February 6, it refused to permit the National Assembly to abolish the dynasty forthwith but insisted on a popular plebiscite. Venizelos himself had been won over with difficulty to the need for prompt action, and the plan of his followers to employ dilatory tactics so dispirited him that on March 4 he announced his intention to quit the country. The republicans and the military party now joined forces with the result that the government fell, on March 8, and Papanastassian, the republican leader, was summoned by the regent to form a new cabinet. The republican ministry, having obtained a vote of confidence in the National Assembly, lost no time in changing the name of the "Kingdom of Hellas" to the "Hellenic State" interdicting prayers for the royal family, and preparing in various other ways for the transition from monarchy to republic. The goal soon was attained. On March 25, while guns boomed and Athens rejoiced, the Assembly unanimously voted a resolution proclaiming Greece a republic, confirming Admiral Koundouriotis provisionally in his powers as regent, and permanently exiling the members of the Glücksburg dynasty. King George was permitted, however, to retain his title and four-fifths of his income for life. The Assembly's resolution was overwhelmingly rati-

fied in a plebiscite on April 13, by 758,742 republican against 325,322 monarchist votes, and accordingly Premier Papanastassian notified foreign powers that Greece had become a republic, and that Koundouriotis was henceforth to be styled Provisional President. On May 18 the draft of the new Greek constitution was made public. The most vexing problem confronting the new government was the repatriation of 1,000,000 or more Greek refugees from Asia Minor and eastern Thrace, and this might well have proved insuperable but for the yeoman work done by the League of Nations' Commission headed by Henry Morgenthau of New York. To aid in the settlement of these unfortunates on the land and in industry, the Bank of England floated two loans of £1,000,000 each; but according to Mr. Morgenthau at least £6,000,000 more was needed. See SMYRNA; also NAVIES OF THE WORLD.

GREELEY, WILLIAM BUCKHOUT (1879-). An American forester, born at Oswego, N. Y., and educated at the University of California and Yale Forest School. From 1904 he served with the United States Forest Service and was at various times inspector of forest reserves in California, supervisor in charge of the Sequoia Natural Forest, and government forester in Washington. In 1920 he was chief forester of the United States. During the War he served with the American army in France as lieutenant-colonel of the 20th Engineers and Chief of the Forestry Section. He wrote many bulletins and circulars relating to forestry.

GREEN, THOMAS EDWARD (1857-). An American lecturer and author, born at Harrisville, Pa., and educated at McKendree College, Princeton University, and Princeton Theological Seminary. From 1880 until 1903 he was active in the ministry of the Presbyterian and Protestant Episcopal churches at Mt. Carmel, Sparta, and Chicago, Ill., and at Cedar Rapids, Iowa. He was elected Bishop of Iowa in 1898 but did not accept the office. After 1903 he was lecturer and chaplain in various national organizations, foundations, and universities. During and after the War he was identified with several movements for peace or war relief. Among his publications are *The Mantraps of the City* (1884); *The Hill Called Calvary* (1898); *In Praise of Valor* (1899-1900); *The War Trust* (1914); *The Truth About Japan* (1915); *Eugenic Democracy* (1917); and *The Dream of the Ages* (1921).

GREENE, ARTHUR MAURICE, JR. (1872-). An American mechanical engineer, born in Philadelphia, and educated at the University of Pennsylvania and in Germany. After serving as instructor at the Drexel Institute, he was appointed professor of mechanical engineering at the University of Missouri in 1902 and served there until 1907, when he became professor of mechanical engineering at the Rensselaer Polytechnic Institute. He remained there until 1922, when he was appointed dean of the School of Engineering and professor of mechanical engineering at Princeton. During the War he was a member of the National Research Council and several other important organizations. He was a member of many scientific and other societies and wrote *Pumping Machinery* (1911); *Elements of Heating and Ventilation* (1912); *Heat Engineering* (1914); and *Elements of Refrigeration* (1916).

GREENE, JEROME DAVIS (1874-). An

American banker, born at Yokohama, Japan, and educated at Harvard and the University of Geneva. He was a member of the faculty of arts and sciences at Harvard (1905-11), general manager of the Rockefeller Institute for Medical Research in New York City (1910-12), trustee and secretary of the Rockefeller Foundation (1913-17), a member of the firm of Lee, Higginson, and Company, bankers of New York (1918), the same of the London branch (1919-), director of the Manhattan Railway Company (1914-), executive secretary of the Reparation Commission at the Paris Peace Conference (1919), and a trustee and member of several prominent institutions and societies.

GREENLAND. With Australia classed as a continent, Greenland is the largest island of the world. It has an estimated area of 840,000 square miles, of which about 5 per cent is habitable along the ice-free coasts; the remainder is covered by an unbroken ice-cap, exceeded in extent and thickness only by that of the continent of Antarctica. In 1921 the population numbered 14,355, practically all Eskimo. This was a gain of 896 over 1911. The births and deaths of the later years showed a steady gain of natives, probably the only instance in which a primitive people has thus thriven under a civilized and alien government. Fortunately the detached natives have come under Danish control. These form communities living in the Smith Sound region, between Cape York and Etah, and in the smaller settlement in the district of Angmagsalik on the east coast. Almost the entire population of what is commonly known as Danish Greenland is concentrated on the southwest ice-free region, facing Baffin Bay, extending northward along the coast for 1200 miles from Cape Farewell to Tasiusak. The two districts, northern and southern, are each governed by a royal inspector who has magisterial powers and is aided by assistants at the more important places. The largest settlement in 1921 was Syd Proven (901 inhabitants) and the smallest Skansen (49). These officials act under control of the Royal Greenland Board of Trade (Copenhagen) who most efficiently guard the interests and welfare of the natives. Schools, churches, and hospitals are maintained, and the Danish Eskimos are a literate, Christian people. Trade is confined to the summer months, owing to the obstructing ice. Imports and exports, each about \$1,000,000 annually, usually balanced; the exports were mostly fox skins and the products of the seal fishery. Danish energy and daring had explored the fauna, flora, geology, ethnology, etc., of this vast region with a thoroughness unequalled in any other Arctic land. The 63 volumes of *Meddelelser* (Communications) *om Gronland* are invaluable contributions to Arctic science. A notable event was the visit of the Danish royal family to Greenland in 1922, to celebrate the bicentenary celebration of the introduction of Christianity into Greenland. Latterly, the exploration of extreme northern Greenland, the northernmost known land of the world, was made by expeditions under Rasmussen and Koch. The former discovered the journals of Mylius-Erichsen who perished in the expedition which completed the coast line of Greenland and who found that Peary Channel is nonexistent. The latter found an interior lake which he suggests contributed to Peary's error. MacMillan's voyage of 1923-24 was expected

to contribute data regarding the ice age of western Greenland.

History. In 1919, Sweden, England, and the United States, realizing the hitherto benevolent nature of Danish policy, formally recognized Denmark's sovereignty over the whole of Greenland. But in 1921 a sharp controversy was precipitated when Norway questioned Denmark's exclusive jurisdiction. The whaling industry was gradually assuming importance; the catch in 1920 was valued at 300,000 kroner, and Norway in the interests of her fishermen controverted Denmark's claim to the economic monopoly which her sovereignty entailed. In short, it was not so much a question of mere political control as it was the right to develop Greenland's industries unchecked by Danish interference. The Danish mercantilist attitude was put on moral grounds; the native Lapps had to be defended from ruthless exploitation at the hands of foreigners. No understanding could be reached, and there was talk of appealing to the League of Nations.

GREENOUGH, CHESTER NOTES (1874-). An American university professor and dean, born at Wakefield, Mass., and educated at Harvard University where he was instructor in English (1899-1907). In 1907-10 he was professor of English at the University of Illinois and in the latter year returned to Harvard, where he has since remained, as assistant professor of English (1910-15), professor (1915-), dean of the college (1919-20), and dean (1921-). He is the author of *A History of Literature in America*, with Barrett Wendell (1904), and *English Composition* (1917).

GREGORY, AUGUSTA, LADY (?-). An Irish playwright (see VOL. X). Her recent plays include *The Golden Apple* (1916), *The Dragon*, and *Aristotle's Belloves*. Lady Gregory is a director of the Abbey Theatre in Dublin.

GREGORY, CHARLES NOBLE (1851-). An American jurist, born in Otsego County, N. Y., and educated at the University of Wisconsin. In 1872-94 he practiced law at Madison, Wis. In 1894-1914, he was dean of the law schools of the universities of Wisconsin and Iowa and George Washington University and became one of the editors of the *American Journal of International Law*. He was made a member of numerous law associations and contributed many articles to professional and literary periodicals. His works include *The Life of Justice Miller of the Supreme Court of the United States* (1907) and *Abstracts of Cases in Lloyd's Reports of Prize Cases* (1919).

GREGORY, JOHN (1879-). An American sculptor. Born in London, England, May 17, 1879, he came to the United States in 1893. After studying at the Art Students' League of New York, 1900-03, and at the Ecole des Beaux Arts, Paris, 1904-06, he won a fellowship in the American Academy in Rome, 1912-15. He was a pupil of George Grey Barnard and Anton Mercie. During the War he was with the camouflage section of the navy department, designing dazzle camouflage. In 1924 he became director of the sculpture department, Beaux Arts Institute of Design, New York. His art was strongly influenced by the archaic Greek style, but not to the detriment of his own individuality. Most of his works are garden figures of originality and charm, such as "Bacchante,"

"Wood Nymph," "Orpheus and Dancing Leopard," a powerful group; and most exquisite of all, "Philomela," in the possession of Payne Whitney, Long Island (replica in Metropolitan Museum, New York City).

GRENADE. See TRENCH WARFARE, and STRATEGY AND TACTICS.

GRETCHANINOV, ALEXANDER TICHONOVITCH (1864-). A Russian composer, born at Moscow. He studied at the Moscow Conservatory with Safonov (1881-91) and at the Petrograd Conservatory with Rimsky-Korsakov (1891-93). He never occupied any official position but devoted his entire time to composition and appeared occasionally as conductor of his own works. His instrumental works show the influence of the German romanticists, but his sacred compositions rank among the finest in all Russian music. Besides two complete liturgies, a *Laudate Deum* for chorus and orchestra, and many sacred choruses à cappella, the list of his works includes two operas, both produced at Moscow, *Dobrynya Nikititch* (1903) and *Sœur Béatrice* (1912); two symphonies, chamber music, and incidental music to Ostrovsky's *Snow Maiden* and A. Tolstoy's *Czar Feodor and Ivan the Terrible*. In 1917 he wrote *Gimn Svobodni Rossi* (Hymn of Free Russia), which was adopted as the national hymn, replacing the well-known anthem of Imperial Russia.

GREW, JOSEPH CLARK (1880-). An American diplomat, born at Boston, and educated at the Groton School and Harvard University. In 1904-16, he was successively clerk and deputy consul-general at Cairo (Egypt), third secretary of legation at Mexico City and St. Petersburg, Russia, and secretary or counselor at Berlin and Vienna. In 1917, when the United States broke off diplomatic relations with Austria-Hungary, he was counselor of embassy and chargé d'affaires at Vienna. He was then attached to the Department of State in Washington and served on various commissions there and in Europe at the time of the treaty of peace. In 1918 he was named secretary-general of the American commission to negotiate peace, with the rank of envoy extraordinary and minister plenipotentiary in Paris, and in 1919 was American secretary of the International Secretariat of the Peace Conference. In 1920 he became envoy extraordinary and minister plenipotentiary to Denmark; in the year following he went to Switzerland in the same capacity. He published *Sport and Travel in the Far East* (1910).

GREY, EDWARD, VISCOUNT (1862-). A British statesman (see VOL. X), who was again appointed Foreign Secretary in 1915 in Asquith's coalition government. In 1916 trouble with his eyes and the succession of Lloyd George as premier caused his resignation from office. He was created Viscount Grey of Faldoen. Viscount Grey had been in office 10 years, during which he steered his ship of state not with remarkable manœuvres but with an even balance of foresight and conservative patriotism. After a two-year rest he was well enough to represent England on a mission to Washington regarding the peace settlement. In 1920 he took keen interest and a prominent part in the founding of a British Institute of International Affairs. See WAR IN EUROPE, *Outbreak of the War*.

GREY, ZANE (1875-). An American

author, born at Zanesville, Ohio. He studied dentistry at the University of Pennsylvania and practiced in New York until 1904, when he turned to writing. His stories, laid in the West, include: *Riders of the Purple Sage* (1912); *Desert Gold* (1913); *The Lone Star Ranger* (1915); *Desert of Wheat* (1919); *The Mysterious Rider* (1921); *To the Last Man* (1922); and many others, all based on themes of heroic incident and thrilling adventure.

GRIERSON, SIR GEORGE (1851-). An English Sanskritist (see VOL. X). His recent works have been editions of W. M. Waterfield's translation of *Alh Khand, the Lay of Ala, a Saga of Rayput* (1923). Sir Aurel Stein's collection of *Harim Tilawona, Kashmiri Stories and Songs* (1923), and in collaboration with Lionel Barnett *Lalla Yogiswari: the Wise Sayings of Lal Deda, a Poet of Ancient Kashmir* (1923).

GRIFFES, CHARLES TOMLINSON (1884-1920). An American composer, born at Elmira, N. Y. He received his entire musical education in Berlin, studying with Jedliczka and Galston (piano), Klatte and Loewengard (theory), and Rufer and Humperdinck (composition). From 1907 till his death, which occurred in New York, Apr. 8, 1920, he taught at the Hackley School in Tarrytown. As a composer he belongs to the extreme futurists. His most ambitious work is a symphonic poem, *The Pleasure-Dome of Kubla Khan*. His other works are a dance-drama, *The Kain of Koridwen*; a Japanese pantomime-play, *Shojo*; two pieces for string quartet; songs, and piano pieces. Two of the last, *The White Peacock* and *Clouds*, were also orchestrated.

GRIFFIN, FRANK LOXLEY (1881-). An American educator, born in Topeka, Kan., and educated at the University of Chicago. After serving on the staff of the Yerkes Observatory, he was appointed instructor of mathematics at Williams College in 1906 and was assistant professor in 1909. From 1911 he was professor of mathematics at Reed College in Portland, Ore. He wrote *Introduction to Mathematical Analysis* (1921), and *Periodic Orbits*, with F. R. Moulton (1920). He also contributed many articles on mathematics and astronomy to scientific papers.

GRIFFIS, WILLIAM ELLIOT (1843-). An American clergyman, educator, and author (see VOL. X). Among his later works are: *The House We Live In—Architect and Tenant* (1914); *The Mikado—Institution and Person* (1915); *Millard Fillmore—Constructive Statesman* (1915); *Bonnie Scotland and What We Owe Her* (1916); *Dutch Fairy Tales* (1918); *Belgian Fairy Tales* (1919); *Young People's History of the Pilgrims* (1920); *Swiss Fairy Tales* (1920); *Was Brant at Wyoming?* (1921); and *Welsh Fairy Tales* (1921).

GRIFFITH, ARTHUR (1872-1922). An Irish public official, born in Dublin. He was the son of a compositor and for several years was engaged in typesetting and proof reading. While at this work he acquired an acquaintance with foreign languages, metaphysics, mathematics, science, and history. He studied for a time at a university on the continent of Europe, and afterwards traveled widely. About 1890 he returned to Ireland, where he established *The United Irishman*. In 1905 he founded the Sinn Fein organization, which in 1916 brought about the Easter rebellion. He was elected a

member of Parliament in 1918, and was an outstanding figure in negotiations with the British government for securing Irish independence. With the establishment of an Irish Parliament he was elected president of the Dail Eireann in January, 1922. He died in August, 1922.

GRIFFITH, DAVID (LEWELYN) WARK (1880-). An American motion picture director, born at La Grange, Ky. He was formerly an actor and for a time was a member of James K. Hackett's company. He became connected with motion pictures first as an actor and then as director for the Biograph Film Company. His best productions include *The Birth of a Nation*; *Hearts of the World*; *Broken Blossoms*; *Intolerance*; *Way Down East*; *Orphans of the Storm*; *America*.

GRINNELL, JOSEPH (1877-). An American zoölogist, born at Wichita, Okla., and educated at Stanford University. At 20 years of age he became instructor at Troop Polytechnic Institute, Pasadena, Cal. He taught ornithology, biology, zoölogy, etc., for 22 years in various California institutions and in 1920 became professor of zoölogy in the University of California. He was editor of *The Condor* and published numerous articles on the birds and mammals of California and Alaska.

GRINNELL COLLEGE. A coeducational, nonsectarian institution at Grinnell, Iowa, founded in 1847. The student enrollment increased from 512 in the College and 192 in the School of Music in 1914 to nearly 900 in 1924, and the number of teachers in the faculty from 50 to 89. An extensive building campaign was inaugurated in 1914; in the decade following, a large modern building known as Alumni Recitation Hall, six residence halls for men, and five cottages and a central hall forming a women's quadrangle were erected. The elective system was greatly extended during the period and many new courses were added to the curriculum, especially in the departments of political science, history, economics, and business administration. The library increased from 50,000 to 73,000 volumes, and the endowment from about \$1,500,000 to nearly \$3,000,000. President, J. H. T. Main, Ph.D., LL.D.

GRIPPE. See INFLUENZA.

GRISCOM, LLOYD CARPENTER (1872-). An American diplomat (see VOL. X). In 1917 he was appointed a major in the department of the Adjutant-General of the United States army and afterwards became Assistant Adjutant-General.

GRISWOLD, SHELDON MUNSON (1861-). An American bishop, born at Delhi, N. Y., and educated at Union College and the General Theological Seminary. From 1885 to 1902 he held pastorates at Ilion, Little Falls, and Hudson, N. Y. In 1902 he was elected and in the following year consecrated missionary Bishop of Salina. In 1917 he was made suffragan Bishop of Chicago.

GRODNO. See LITHUANIA.

GROLL, ALBERT LOREY (1866-). An American painter (see VOL. X). His preoccupation with desert scenes with conspicuous cloud effects continued until 1921, when he reverted to his earlier interest in foregrounds. In some later pictures, among them "A Breezy Day—California," and "Wind Storm in Nevada," his clouds no longer dominate.

GROSSMITH, GEORGE (1874-). An

English comedian, son of George Grossmith and brother of Weedon Grossmith. He first appeared in an operetta by his father at the Shaftesbury Theatre and became a popular figure in musical comedy in London. He was the author or joint author of many musical plays, songs, and revues. He became lessee and manager of several playhouses in London in association with Edward Laurillard.

GROSSMITH, WEEDON (1853-1919). An English comedian, born in London. He was educated to be a painter but in 1885 he turned to the theatre and joined Rosina Voke's company, touring in the provinces and the United States. His first appearance in London was as Woodcock in *Woodcock's Little Game* (1887), and he gained his first notable success in *A Pantomime Rehearsal*. In 1894 he successfully produced his own play, *The Night of the Party*. Among his best parts are the rôles of Archibald Bennick in *The New Boy*, Jimmy Jinks in *Baby Mine*, the Earl of Tweenway in *The Amazons*, and the Judge in *Stopping the Breach* (1917), and the last rôle in which he played. He wrote an autobiography, *From Studio to Stage* (1913).

GROSVENOR, GILBERT HOVEY (1875-). An American geographer (see VOL. X). In 1920 he was president of the National Geographic Society. In 1919 he discovered a lake in Alaska 28 miles long, which was named Grosvenor Lake in his honor.

GROTHER, HUGO A. L. (1869-). A popular and prolific German writer on travel and on political and economic problems. He was born in Magdeburg and studied at the universities of Leipzig, Vienna, Munich, Würzburg, Rostock, and Berlin. He traveled in southern Europe, the Caucasus, Asia Minor and other countries. A volume of verse and of light fiction excepted, he has written only books of economic, political and even international import, as *Tripolitaniën und der Karawanenhandel nach dem Sudan* (1898); *Tripolitaniische Landschaftsbilder und Völkertypen* (1899); *Die Bagdadbahn und das Schwabische Bauernelement in Transkaukasien und Palästina* (1902); *Auf Türkischer Erde, Reisebilder und Studien* (1903); *Landeskunde von Rumänien* (1906); *Wanderungen in Persien* (1910); *Das Albanien und Montenegro* (1913); *Das Albanische Problem* (1914); *Deutschland, die Türken, und der Islam* (1914); *Die Türken und ihre Gegner* (1915); *Das Auswanderungsproblem und die Deutsche Volkskolonisation* (1920); and *Bulgarien. Natur, Staat und Volk* (1920).

GROUP MIND. See SOCIAL PSYCHOLOGY.

GROVE, FREDERICK WARREN (1876-). An American educator, born in Lynn, Mass., and educated at the Massachusetts Institute of Technology, Wesleyan University, and George Washington University, and in Germany. He served on the faculties of Harvard and Wesleyan Universities and Lafayette College, and from 1902 to 1907 was laboratory assistant and associate physicist for the National Bureau of Standards. From 1911 to 1920 he was professor of physics at Colby College, and from the latter date, assistant professor of electrical engineering at Union College. From 1918 he was consulting physicist at the Bureau of Standards. During the War he performed valuable service at the Bureau of Standards, in Washington. He was the author of various scientific articles and bulletins and was the joint author

of *Principles Underlying Radio Communication* (1918).

GRUBER, L. FRANKLIN (?-). An American clergyman, educator, and author, born near Reading, Pa., and educated at the Keystone State Normal School, Muhlenberg College, the Neff College of Elocution and Oratory, and the Mt. Airy Lutheran Theological Seminary. In 1901-02 he was professor of mathematics and English at Wagner College, Rochester, N. Y. On being ordained to the Lutheran ministry in 1901, he became a pastor at Utica (1902) and later at Minneapolis Minn. In 1914 he was made pastor of the Church of the Reformation at St. Paul. His works include *The Version of 1611* (1903); *The Truth About Tyndale's New Testament* (1917); *Documentary Sketch of the Reformation* (1917); *The Wittenberg Originals of the Luther Bible* (1918); (*Creation ex Nihilo*) (1918, republished in 1921 under the title *Whence Came the Universe?*); *The Theory of a Finite and Developing Deity Examined* (1918), and *Is the Doctrine of an Infinite and Unchangeable Deity Tenable?* (1921).

GUADELOUPE. A colony of France, comprising two islands and five island dependencies, in the Lesser Antilles in the West Indies. Area, 688 square miles; population (1922), 229,839, of whom 90 per cent were Creoles. The largest towns were Pointe-à-Pitre, 22,664 inhabitants; Basse-Terre, 8184; Le Moule, 10,000. Leading products, as reflected in the exports for 1921, were sugar (25,024 tons), rum (9,054,063 litres), and coffee (657 tons). Exports for 1913, 1920, and 1921, were 18,287,489 francs, 146,389,180 francs, and 74,601,693 francs. Imports for the same years were 20,174,930 francs, 117,858,064 francs, and 78,989,677 francs. The increased prosperity of the islands was occasioned by the heavy demands made on them for sugar and rum by France. The budget for 1922 had increased to 27,278,611 francs, from the 1911 budget of 4,560,000 francs.

GUAM. An island of the Marianas or Ladrone group, in the Pacific, belonging to the United States, area, approximately 226 square miles. The population of Guam increased from 12,652 in 1913 to 13,275 in 1920. Since the American occupation in 1901, the population increased about 3600. Between 1918 and 1919 population decreased because of a disastrous typhoon on July 6, 1918, and an epidemic of influenza which swept over the island in October and November of that year. From Nov. 1 to Dec. 31, 1918, there were 858 deaths. Of the population, 92 per cent are called Chamorros, a hybrid race with a Malayan strain predominating. The remainder of the population includes Filipinos, Japanese, Chinese, blacks, and whites.

Agriculture. Corn is by far the most important agricultural product, representing 60.3 per cent of the total. While there was an increase in agricultural production during the decade 1914-24, the island did not become self-supporting. There is more arable land than the present population can cultivate with the means at hand. Other agricultural products are sweet potatoes, yams, tobacco, cassava, rice, arrowroot, and sugar. The live stock includes carabao, horses, goats, hogs, and cattle. The carabao in 1916 numbered 6149 and the horses 4367. The carabao is the chief burden-bearing

animal and is used both for drawing carts and for plowing.

Commerce. The chief commercial product of Guam is copra, obtained from coconuts. The exports of copra to the United States increased from 259,360 pounds in 1915 to 1,140,924 in 1919. Considerable quantities were also sent to Japan. In 1915, 731,180 pounds were sent to that country and in 1919, 851,680.

Education. Under the early Spanish governors public education was discouraged; the rulers believed that the natives would be more tractable if they remained illiterate. In later years free schools were established, and by the time the United States resumed control of the island, a majority of the natives could read and write in Spanish. The efforts of the Americans to teach the Chamorro children to use the English language did not prove very successful. The percentage of illiteracy in 1920 was 21.8 and was especially large among the adults. The total number of persons able to speak English in 1920 numbered 4384. During the decade 1914-24 considerable progress was made in the development of an educational system. By the end of that period in 1923, 14 primary schools, one intermediate school, and one high school were operated by the Department of Education. There were also several private schools. The total expenditure for education amounts to about \$40,000 annually. The registration in the schools in 1923 was 3500 and the average daily attendance 2265. A compulsory education law compelled the attendance of all children between the ages of 7 and 12.

Finance. The receipts amount to about \$100,000. In 1916 they were \$91,816; in 1923, \$106,719. Expenditures in 1916 were \$87,058; in 1923, \$106,719.

GUATEMALA. The largest of the five Central American republics, with an estimated area of 48,290 square miles, and a population, according to the 1920 census, of 2,004,900. The population in 1912 was 2,119,000. Guatemala, the capital, had 91,330 inhabitants in 1921. Earthquakes from Dec. 25, 1917, to Jan. 24, 1918, completely destroyed the city; but by 1922 much of the work of restoration had been completed. Other towns are Quezaltenango (35,000), Coban (30,770), and Totonicapan (23,310). Education was on the increase in 1922-23, with 2766 elementary schools as compared with 1837 schools in 1912. The total number of pupils was 82,997, of whom 4715 were taking secondary courses. In 1918 the University of Guatemala was opened, and by 1923, 482 students were enrolled. Expenditure for education in 1922-23 was 50,806,700 pesos.

Industry. Coffee planting continued the most important single activity, and coffee exports included more than three-fourths of the exports. In 1922 there were 1500 plantations covering 242,062 acres, and 95,918,000 pounds were exported in 1923 as compared with 76,219,800 in 1912. Bananas and sugar came next in importance as export crops. Food crops were being cultivated more extensively in 1922; 526,322 acres were under corn, 9226 under rice, and 31,940 under wheat. Forest products were beginning to play larger rôles in the country's trade, for by 1922 chicle to the value of \$306,038 was exported (\$142,108 in 1913), and timber to the value of \$526,442 (\$247,757 in 1913). Mineral production was still back-

ward because of lack of transportation and capital. Chrome was discovered in 1916, and oil seepages were reported in 1922. Total mineral exports in 1920, to the United States chiefly, were valued at \$226,645. (In 1912, the figure was only \$2737.) In December, 1915, the state took over all the ore lands in the country, to be exploited under leasehold only. Imports and exports for selected years follow:

	Imports	Exports
1914.....	\$9,331,115	\$12,754,027
1920.....	18,344,463	18,102,906
1923.....	13,767,499	14,725,531

Proportions by countries of origin of imports were, for 1922, the United States, 63 per cent (50 in 1913); United Kingdom, 15 per cent (16 in 1913); Germany, 11 per cent (20 in 1913). Leading articles of importation were cotton goods, wheat flour, iron and steel manufactures, machinery, foodstuffs, drugs, and medicines. Proportions by countries of destination of exports were the United States, 68 per cent (27 in 1913); Germany, 16 per cent (53 in 1913); Netherlands, 8 per cent; the United Kingdom, 2 per cent (11 in 1913). Coffee went principally to the United States and Germany in the proportion of 4 to 1. The importance of the United States in the carrying trade increased enormously. In 1913, 803 ships entered Guatemalan ports, 23 per cent of which were American; in 1920, 758 entered, 61 per cent being American.

Communications. In 1914 the International Railways of Central America, purchased by American capitalists in May, 1924, acquired a 60-mile railroad from Santa Maria to Las Cruces and built an extension of 45 miles from Las Cruces to Ayutla on the Mexican border. This was part of a larger scheme to build a through route between Vera Cruz and Panama, extending along the entire western length of Central America. In 1916 a concession was granted for the construction of an intracostal canal skirting the Pacific coast for 80 miles from San José to the Esclaves River. The total railway mileage was 495. In 1920, there were 4512 miles of telegraph line and 416 miles of telephone.

Finance. For 1922-23, national revenues totaled 306,810,078 paper pesos and the budget for 1923-24 called for 351,705,125 paper pesos. Expenditures for 1922-23 were 41,679,823 pesos more because of payments made to the International Railways of Central America. On Dec. 31, 1922, the external debt, held in England, was £1,308,563. Amortization was going on rapidly, in 1921 a total of £323,340 being paid, and in 1922, £32,080. The internal debt on Dec. 31, 1921, amounted to 157,700,000 paper pesos and 1,381,570 gold pesos. In 1918 a National Bank was established, one of its chief purposes being the making of agricultural loans. On June 30, 1922, there were in circulation 367,435,298 paper pesos. Comparative figures are invalidated by the continuous depreciation of the paper peso, the currency in use. In 1912 the peso was worth 18 to the dollar; in 1922, 55.84 to the dollar. On May 31, 1923, it closed at 60.5.

History. At the expiration of his term in 1916, Estrada Cabrera was once more reelected president. His virtual dictatorship since 1898 was successfully broken in 1920, when the more progressive elements of the country organized

to effect a liberal administration. Cabrera was the first to resort to force, but his army deserted him, and he was compelled to resign. Dr. Carlos Herrera was appointed provisional president and on Sept. 15, 1920, took the oath for the unexpired term, 1916-23. He was immediately recognized by the United States. He applied himself to repairing the damages of the earthquake and was also instrumental in having Guatemala form the Central American Union (q.v.) together with Honduras and Salvador in 1921. On Dec. 6, 1921, however, he too was overthrown by a military clique incensed at the country's participation in the Union, and a provisional government was formed by General Orellana, chief of staff Orellana was elected president in March, 1922; by July he was confronted by a rebellion which proved unsuccessful. The leaders were put to death, and two Catholic priests were expelled. It appeared for a time that the new government had no desire to aid in the formation of a federal Central American state, and in October, 1922, Orellana repudiated the pact signed on the U.S.S. *Tacoma* on Aug. 20, 1922, by Nicaragua, Honduras, and Salvador, though his government participated in the Central American Conference of 1923 at Washington and signed the conventions concluded. In June, 1924, however, Guatemala once again took a forward step in the furthering of amicable Central American relations when her Assembly was the first to ratify the important General Treaty of Peace and Amity and the Convention for the Establishment of International Commissions of Inquiry, both adopted by the Central American Conference in Washington in 1922. On Apr. 27, 1917, Guatemala broke off diplomatic relations with Germany and offered her transportation facilities to the United States in the prosecution of the War. On Oct. 3, 1919, peace was made with Germany.

GUCHKOV, ALEXANDER (1862-). A Russian politician, born at Moscow, and educated at the University of Moscow and under Professor Schmoller of Berlin. He led an adventurous youth as a volunteer in the Boer War (1899-1902) and with the Red Cross in the Russo-Japanese War. In the third Duma, after Khomiakov's resignation in 1901, he was elected speaker and as such attacked the Court and the Ministry of War for inadequate military preparations against Germany. During the War he came into prominence by his energetic attempt to concentrate the army forces. On the outbreak of the March Revolution in 1917 he was made Minister of War but resigned in the face of desertions and demoralization in the army. He eventually took refuge in Paris and was active there in collecting forces against the Red element in Russia.

GUEDALLA, PHILIP (1839-). An English author, educated at Rugby and Oxford. He read for the bar and practiced law for a time but soon turned to journalism and became a frequent contributor to the *London Times*, *New Statesman*, *Daily News* and the *American Vanity Fair*. His first work was published in 1911, but it was not until the publication of *The Second Empire* (1922) that he was accorded general recognition. In this work, with great skill and not a little malice, he succeeded to large extent in dissipating the Napoleonic myth and in scaling down the heroic proportions of Napoleon the Little. The same qual-

ities were to be found in his essays *Supers and Supermen* (1920) and *Masters and Men* (1923).

GUERARD, ALBERT LÉON (1880-). A French philologist, born in Paris, and educated in Paris and London. After an interval of travel he became professor of literature and examiner in history at the Ecole Normale. In 1906 he became instructor in French at Williams College, and from 1907-13 was assistant professor of French at Stanford University. Since 1913 he has been professor at the Rice Institute in Houston, Tex. During the War he was in liaison service. His principal works are: *Prophets of Yesterday* (1913); *French Civilization in the Nineteenth Century* (1914); *Five Masters of French Romance* (1916); *L'Avenir de Paris* (1919); *French Civilization from Its Origin to the Close of the Middle Ages* (1920), and *International Languages* (1921).

GUERIN, JULES (1866-). An American painter and illustrator (see VOL. X). He was director of color and decoration at the Panama-Pacific International Exposition, 1915. Noteworthy among his works during the period were the decorations of the Pennsylvania Station, New York City, and those of the Lincoln Memorial Building, Washington.

GUEST, EDGAR ALBERT (1881-). An American press humorist, born at Birmingham, England, and educated in the public schools of Detroit. In 1895 he became connected with the *Detroit Free Press* and has since established a reputation as a writer of humorous verse and sketches. He is author of *A Heap o' Luvvies* (1916), *Just Folks* (1917), *Over Here* (1918), *Path to Home* (1919), *When Day is Done* (1921), *Poems of Daily Life* (1922), and *All That Matters* (1923).

GUIANA, BRITISH. A British colony on the northeastern coast of South America, forming the western part of Guiana. Area, 80,490 square miles; population in 1911, 296,000; in 1922, 298,188. Georgetown, the capital, had 53,422 inhabitants in 1921. On Dec. 31, 1922, there were 124,338 East Indians in the colony, of whom 56,781 were residents on estates, and 67,557 resided elsewhere. The leading products were sugar cane, diamonds, balata, bauxite, rice, coconuts, coffee, cacao, wood, and timber. The steady decline of gold continued; the 1923 output was 5621 ounces as compared with 79,194 ounces in 1913. The diamond output showed increases with the discovery of new fields in 1922. Imports for 1913, 1922, and 1923, were \$7,734,862, \$11,004,414, and \$12,811,011. Exports for the same years, including transit trade, were \$10,526,976, \$14,042,322, and \$18,036,707. The eight principal imports in 1923 were flour, textiles, manure, pickled pork and beef, boots and shoes, butter, cement, and tobacco. These came largely from Great Britain, the United States, and Canada. Exports to the United States, which reached \$4,223,110 in 1920, chiefly in sugar shipments, dropped to \$309,477 in 1922, and recovered to \$762,066 in 1923. The general fall in prices after 1920 accounted for the depression. Total tonnage entered and cleared in 1911-12, 1920, and 1921, was 988,663; 899,748, and 876,709. Total tonnage entered in 1923 was 537,396. Revenues for 1913 and 1922 were \$2,786,140 and \$4,345,218; expenditures for the same years were \$2,764,121 and \$5,269,364. The public debt on Jan. 1, 1922, was £1,170,238.

Dutch Guiana or Surinam. Located be-

tween British Guiana on the west and French Guiana on the east. Area, 46,060 square miles; population in 1910, 86,233; in 1921, 113,181, exclusive of the Indians and Negroes living in the forests. Nationalities represented in 1919 were 1109 Europeans, 11,480 Javanese, 940 Chinese, and 26,096 British Indians. Paramaribo, the capital, had 35,346 inhabitants in 1910 and 50,560 inhabitants in 1920. The leading products were sugar cane (26,430,000 pounds in 1910; 24,433,000 in 1921), rice (4,386,000 pounds in 1910, 25,954,000 in 1921), cacao (3,702,600 pounds in 1910; 3,475,800 in 1921), coffee (445,000 pounds in 1910; 3,987,260 in 1921), and bananas (462,200 bunches in 1910; 297,605 in 1921). Gold production in 1910 was 1,081,476 grains, and only 291,347 grains in 1921; balata, 1,495,300 pounds in 1910 and 1,021,700 in 1921; and rum, 210,780 gallons in 1910 and 182,370 in 1921. Exports for 1912 and 1922 were \$3,391,050 and \$2,092,094. Imports for 1912 and 1922 were \$3,014,604 and \$3,894,402. In 1922 the United States furnished \$843,761 of the imports of Dutch Guiana, and in 1923, \$810,475. The United States took \$695,859 of her exports in 1922 and \$820,931 in 1923. Leading imports were provisions, hardware, clothing, and manufactured articles. Tonnage entered in 1910 was 210,998; in 1921, 372,431. Revenues, expenditures, and subvention for 1914 were 7,051,800 guilder, 6,260,530, and 790,260. For 1922 they were 8,300,000 guilder, 6,678,000, and 1,682,000 (nominal value of the guilder, \$0.402).

French Guiana. Forming the eastern part of Guiana. Area, 34,069 square miles; population in 1911, 49,009; in 1921, 44,202. Creoles made up four-fifths of the inhabitants. In 1922 the penal population totaled 6075 individuals. Cayenne, the leading town, had 13,527 inhabitants in 1911, and only 8500 in 1921. The industrial and agricultural development of the colony made little progress in the decade 1912-22, gold continuing to be the product of greatest economic importance. However, a marked decline was visible over the period. In 1910, 123,170 ounces were produced; in 1918, 80,477; in 1921, only 38,667. Of the total exports of 12,117,000 francs in 1912, gold accounted for 10,457,000 francs. Of the total exports of 23,144,060 francs in 1921, gold accounted for only 10,617,542. Next in importance in the latter year was balata, with 10,296,766 francs in exports. Other exports were rosewood essence, hides, and cacao. Rice, manioc, cacao, coffee, bananas, and vegetables were cultivated in small quantities for local consumption. Imports for 1912 and 1921 were 10,905,000 and 48,150,967. About 90 per cent of the exports were taken by France and her colonies in 1920, and 50 per cent of the imports came from France. The United States trade with French Guiana in 1923 was: imports, \$178,963, exports, \$350,169; as compared with \$334,988 and \$398,249, respectively, in 1922. The local budget for 1912 balanced at 3,592,000 francs, for 1922, at 7,102,587. Subventions from the French government were still necessary. The rivers remained the only decent means of transportation.

GUILD SOCIALISM. Guild socialism, an English social development, aims at "the abolition of the wage system and the establishment by the workers of self-government in industry," and ultimately, a new social order. Stress is

laid on a gradual rather than on a revolutionary change, although industrial action is preferred to political action. The movement is chiefly intellectual. The present industrial society is attacked on the ground that private profit and employers' autocracy kill the workers' incentive and interest in their work and thereby prevent their becoming healthy social beings. It is asserted that by giving the worker a definite function and a voice in the management of industry, the wrongs of capitalism will be eradicated, production increased, and productive incentive revived. Thus a new society with a definite function for everybody will be created. This emphasis on function and functional control is the basis and the distinctive quality of the guild philosophy. It is to be realized through the guilds. A guild is defined as "a self-governing association of mutually dependent people organized for the responsible discharge of a particular function of society." Organized therein should be "all the workers, by hand and by brain." All of society should be divided into guilds. The adherents of the movement, or National Guildsmen, as they term themselves, agree on two types: industrial and civic guilds. Some add a third, the distributive guild. The industrial guilds would engage in "the various branches of transport and manufacture," while the civic guilds would embrace the professions. Concerning the structure and government there is still much disagreement among guildsmen, but the theory of industrial democracy seems to prevail. Decentralization is also emphasized. The functions of the modern state would be carried on by certain definite guilds. Relations between the guilds would be provided for by "liaison" (akin to the present-day interlocking directorates) and guild councils. The latter would be local, regional, and national, and would take over many legislative and administrative functions of the state and the Trade Union Congress. As for the relations between the guilds and the community there were many conflicting theories. While guild socialism was accused of not providing any definite authority, its adherents claimed that by dividing society into functional organizations, sovereignty would also be adequately divided. It was generally conceded that the scheme's chief difficulty lay here.

The movement arose in the first decade of this century, through antagonism to the ruling collectivism in English radical thought, and was definitely formulated in 1906. Its first formal appearance, however, was in 1912. On Christmas, 1914, the Stonington Document, containing a statement of principles, was drawn up. On Easter, 1915, the present organization was completed, and the name of National Guilds' League was adopted. In the early years of the War, guild socialism grew slowly; its growth was more rapid during the last years of the War and after the Armistice. Although British trade unionists were rather unresponsive to guild ideas, the movement had nevertheless a considerable indirect influence on English labor, especially in the restive years after the War, when there was widespread unemployment, discontent, and strikes throughout the country. Guild socialism spread in one form or another, and with its increasing hold on the more revolutionary elements, it became itself more radical. The British Miners' Federation was always somewhat in sympathy with

guild ideas, and its proposal for the nationalization of the mines embodied a concept of guild socialism. The Union of Post Office Workers and the National Union of Teachers adopted resolutions to organize on the guild plan. Finally the guild idea found practical application in the Builders' Guilds, organized in conformity with guild principles. These guilds proved rather successful for a time. The guild plan spread subsequently to house furnishings, tailoring, engineering, and other trades. Partly on account of severe competition and partly on account of poor management, the Building Guild became involved in financial difficulties, and in November, 1922, it went into a receiver's hands and was later dissolved. In May, 1923, the National Guilds' League merged with the National Guilds' Council, and *The Guild Socialist*, the official monthly, ceased publication. After the year 1922, the Guild movement declined perceptibly. See SOCIALISM, Great Britain.

Outside of England the guild idea exerted more or less influence in the United States, Canada, Australia, New Zealand, South Africa, Japan, Russia, France, Germany, Hungary, and Italy. The National Guilds' League, the chief organization for the spread of guild principles, never had a large membership. In January, 1921, it had "something over 500." Its literary activity has been marked. From March, 1919, to May, 1923, it published *The Guild Socialist*. *The New Age* has steadily advocated guild socialism since 1912. The chief missionary work was done, however, though the books of important guildsmen such as Penty, Orage, Cole, Hobson, Douglass, Reckitt, Bechhofer, de Maetz, Taylor, and others.

GUILLAUME, CHARLES EDUARD (1860-). A Swiss scientist, born in Fleurier. He studied at several European universities and in 1883 was appointed assistant of the Bureau of International Poids and Measures. In 1902 he was associate director of the bureau, and from 1915, director. He was awarded the Nobel Prize in 1920 and was a member of many scientific societies. He wrote *Nickel and Its Alloys* (1898), *Application of Nickel Steels* (1904) and many other works on scientific subjects.

GUISEZ, JEAN (?-). A French surgeon, authority on the ear, nose, and larynx and on the use of the bronchoscope, his status in his country corresponding to that of Chevalier Jackson in the United States. He has produced a number of authoritative works comprising *Du Traitement Chirurgicale de l'Éthmoroïde Purulente* (1902); *Tracheobronchoscopie et Esophagoscopie* (1905); *La Pratique Otorhino-laryngoscopique* (3 vols., 1908); *Esophagoscopie Clinique et Thérapeutique* (1911); *Diagnose, Traitement, et Expertise des Séquelles Otorhino-laryngologiques* (1921); and *Diagnose et Traitement des Rétrécissements de l'Esophage et de la Trachée* (1923).

GUITERMAN, ARTHUR (1871-). An American author and poet, born in Vienna, and educated at the College of the City of New York. He did editorial work on the *Woman's Home Companion*, *Literary Digest*, and other magazines. In 1912-15 he lectured at the New York University School of Journalism. Among his works are: *Betel Nuts* (1907); *The Laughing Muse* (1915); *The Mirthful Lyre* (1918); *Ballads of Old New York* (1920); *Chips of Jade* (1920); *A Ballad Maker's Pack* (1921);

and *The Light Guitar* (1923). These were mostly light verse. Mr. Guiterman has contributed to *Life* and other periodicals.

GUITRY, SACHA (1885-). A French actor and writer, son of Lucien Guitry (see Vol. X). He has written many comedies for the stage. Among the best known are *Les Nuées d'Aristophane*; *La Clef*; *Le Crin*; *Petite Hollande*; *Le Muffe*, *Un Sujet de Roman* (1923). As a playwright he works on the assumption that audiences do not want "too much realism" but recreation and amusement. His *Deburau* and *The Grand Duke* were successful in New York with Lionel Atwill in the leading parts.

GULICK, SIDNEY LEWIS (1860-). An American missionary, born at Ebon, Marshall Islands, and educated at Dartmouth College and Union Theological Seminary. He was ordained to the Congregational ministry in 1886 and in the next year went to Japan, where he remained for 27 years doing missionary work. At the same time he held the chair of theology at Dolshisha, Kyoto (1906-13) and lectured at the Imperial University at Kyoto (1907-13). He was secretary of the National Commission on American-Japanese Relations (1921-). Among his works are: *Evolution* (1910); *The American-Japanese Problem* (1914); *The Fight for Peace* (1915); *America and the Orient* (1916); *American Democracy and Asiatic Citizenship* (1918); and *The Korean Situation* (1919, 1920).

GUNNERY, NAVAL. The development of naval gunnery during the War was along lines laid down several years previous. The sole innovation was "spotting" the fall of projectiles by means of aircraft. This was used only on a few occasions and in comparatively minor operations against works on shore. No vessels were fitted to carry, send out, and receive airplanes early enough to take part in purely naval warfare. The German airships did much scouting but little spotting, and airships were not yet, in 1924, to be depended on for "spotting" except in the vicinity of their bases; while observation or kite balloons towed by ships had proved unsatisfactory except under favorable conditions. It is to be expected that when fleets and squadrons are accompanied by aircraft carriers, when all large vessels carry one or more airplanes or seaplanes, and when even destroyers and submarines may carry folding seaplanes, i.e. airplanes fitted to take off from and alight on the water, the conditions will be different; and aircraft may be as useful for "spotting" at sea as they are on shore.

"Director" firing, in which guns are laid in accordance with directions electrically transmitted from a central director station, received ample verification of its importance by the experiences of the War. It was yet susceptible of great improvement by the better training of the men at the guns and in the director station and by greater accuracy and efficiency of observing instruments and of the means and methods of combining their readings. These instruments consist of telescope sights on the guns and in the director tower or station, range finders, range clocks or keepers, change-of-range indicators, deflection indicators, course indicators, and mapping or combining apparatus. The range finder most in use during and after the War is the Barr and Stroud. (See NEW INTERNATIONAL ENCYCLOPEDIA, Vol. XIX,

p. 542). The range keeper is a dial or other form of register in the central station by which the range indicators at the guns are controlled. Change-of-range indicators are automatic calculating machines which, given the observed range at two moments, continue to apply the rate of change and indicate the probable range after each small interval of time. When new ranges are supplied to it, the ranges are corrected in accordance with the new rate. The ranges shown on the range keeper and range indicators at the guns are derived from the change-of-range instrument, and it may be directly connected to both; in this case the corrections to the range due to observed fall of the shot are applied to the ranges as supplied to the change-of-range instrument instead of to the range keeper. Deflection indicators keep track of the observed fall of the projectiles to the right or left of the target and transmit it to suitable dials at the guns, where the gun-sights are set in a new angle with the axis of the bore in order to correct the ascertained error due to various causes such as speeds of ship and target, changes of course, air currents, etc. Course indicators are used in connection with the plotting or combining apparatus or diagram or for solving the enemy's course and speed. The director tower or station is directly connected with the central station or plotting room and with the guns. The observer at the director sight fires the battery in whole or half salvos or singly in accordance with instructions. The fall of the projectiles is noted, and if necessary, corrections are made in range or deflection. The foregoing gives only a general idea of modern methods of the control of gun fire such as were used in the War and afterward. The details and the instruments used are closely guarded secrets, but the work performed is roughly as described. See ARTILLERY and ORDNANCE.

GUNS. See ARTILLERY.

GUNS, NAVAL. The calibre and power of the heavy guns of battleships increased steadily from 1910. By the terms of the Limitation of Armaments Treaty the maximum calibre was fixed at 16 inches, and guns of this calibre will probably be carried by all first class battleships and battle cruisers built in future. The length of the guns will be 45 or 50 calibres and the service muzzle velocity about 2800 feet per second. Higher velocities could readily be obtained, but they would greatly shorten the effective life of the gun; at 2800 feet the life is short enough. As "spotting" (of the fall of projectiles) from kite balloons or other aircraft will be possible in future naval battles, high-angle and long-range firing is being sought, and the gun mounts of recent battleships are arranged for an elevation of 30° or more. The largest calibre of gun that can be carried by cruisers under the treaty is 8 inches, and all 10,000-ton cruisers of modern design will carry six or eight 8-inch guns on high angle mountings.

The increased size of destroyers and flotilla leaders has caused some increase in the calibre of the guns in the auxiliary battery of battleships. The 43,200-ton battleships for the United States Navy, which were under construction but were scrapped by the treaty, were to have carried 6-inch guns in their auxiliary battery, and the new 35,000-ton battleships building in England are so fitted; but the Japanese, in their new battleships which were scrapped, con-

tented themselves with a very numerous battery (20 guns) of 5.5-inch calibre. The naval gun which was receiving widest attention in 1924 was the anti-aircraft weapon. The new British battleships were to carry 12 of these of 4-inch calibre. Much larger guns, using an improved shrapnel-shell, have been considered, but their general adoption awaits some convenient form of semi-automatic loading while held in the firing position. The new 10,000-ton Japanese light cruisers were reported to be fitted with 4.7-inch guns for use against either horizontal or aircraft targets. The details of the design were unknown in 1924. Automatic guns of unusual length and high velocity, firing projectiles of extra length and of calibres from 0.5-inch to 1.5-inch, were advocated by many naval officers. Such guns would have nearly as great range and sustained velocity as the present 4-inch guns, combined with a vastly increased number of projectiles and much greater ease of operation. See ARTILLERY; ORDNANCE; VESSEL, NAVAL; PROJECTILE, NAVIES OF THE WORLD.

GÜNTHER, SIEGMUND (1848-1923). A German geologist (see Vol. X). He became editor of the *Munchener Geographische Studien* in 1896 and published, in the period 1914-24, *Das Zeitalter der Entdeckungen* (1919), *Geschichte der Naturwissenschaften* (1919), and *Lehren der Revolution* (1920).

GURLITT, CORNELIUS (1850-). A German architect, art critic and historian, born in Nischwitz. After some years of activity as an architect in Cassel and Dresden, he was commissioned to write a work on the art monuments of Saxony. This publication, sumptuously illustrated, appeared in installments from 1894 to 1919. Gurliitt is the author of many works on art, of which the following are of general interest: *Kunst und Künstler am Vorabend der Reformation* (1890); *Beiträge zur Geschichte der Gothik* (1892); *Sir Edward Burne-Jones* (1894); *Die Kunst des Neunzehnten Jahrhunderts* (1900); *Geschichte der Kunst* (1902); numerous monographs on cities, including Berne, Zurich, Lyons, Liège, and Cambridge (1903-08); *Constantinopel* (1907); *Das Französische Sittenbild im Achtzehnten Jahrhundert* (1912); *Schutz der Kunstdenkmäler im Kriege* (1915); *Die Klosterbauten in Belgien*, with Professor Clemen (1916); *Handbuch des Städtebaus* (1920); and *Pflege der Kirchlichen Kunstdenkmäler* (1921).

GUSEV-ORENBURGSKY, S. I. (1867-). A Russian novelist. His novels are realistic studies of the life of the Russian clergy in the rural districts and are filled with revolutionary feeling. He is the author of *Short Stories* (1899-1916), *The Land of the Fathers over the Meadow* (1909), and *Darkness* (1915).

GUTHRIE, WILLIAM NORMAN (1868-). An American clergyman, born at Dundee, Scotland, educated at the University of the South, and from 1889 to 1910 lecturer and professor of literature at several universities, including the University of Chicago. In 1910 he became rector of the Church of St. Mark's-in-the-Bow-erie, New York City. He attracted attention, in the latter part of 1922, by stating that dancers would be trained to interpret religion, and in March, 1923, he held an Egyptian sun-god dance at his church, and from time to time it was announced that certain pagan rites were celebrated there. Bishop Manning asked for an explanation, but was not satisfied of the pro-

priety of the dances and vetoed them in January, 1924. The rector continued the services, however, and in March, 1924, St. Mark's was deprived of episcopal ministrations pending the time when the Bishop's counsel should be heeded. His publications include: *Beyond Disillusion, a Dramatic Study of Modern Marriage* (1915); *Uncle Sam and Old World Conquerors* (1915); *The Gospel of Osiris* (1916); *Leaves of the Greater Bible* (1917); and *The Religion of Old Glory* (1919).

GUYER, MICHAEL FREDERICK (1874-). An American zoölogist, born at Plattsburg, Mo., and educated at the University of Missouri, the University of Chicago, and the University of Nebraska. He was assistant in zoölogy at the University of Nebraska (1894-97), professor of zoölogy at the University of Cincinnati (1900-1911), and professor of zoölogy at the University of Wisconsin (1911-). Professor Guyer published articles on cytology, genetics, and the transmission of acquired defects through the influence of antibodies, as well as *Animal Micrology* (1906; rev. ed., 1917), and *Being Well Born* (1916).

GYMNASTICS. See **SPORTS**.

GYPSUM. The production of gypsum and gypsum products remained an industry of ever growing importance in 1914-24. During this time the production of crude gypsum in the United States never fell below 2,000,000 tons, and in 1922 it amounted to 3,779,949 short tons, with a value for the crude and calcined products sold of \$29,361,151. In addition to the gypsum produced in the United States, crude, ground, or calcined gypsum to the amount of 410,937 tons, valued at \$552,516, was imported into the United States, of which 405,912 short tons, valued at \$539,996, came from Canada. The Canadian gypsum was largely sold in the vicinity of New York City. New York State is the largest producer, with Michigan, Ohio, Iowa, Texas, Nevada, and Oklahoma following in the order named and together accounting for over 80 per cent of the United States output. The accompanying table indicates the uses of the 1922 production of gypsum.

According to the United States Geological Survey, the 3,779,949 short tons of crude gyp-

GYPSUM PRODUCED AND SOLD IN THE UNITED STATES IN 1922, BY USES

Calcined		
	Short tons	Value
Stucco	396,990	\$2,813,561
Neat plaster	1,333,261	12,126,811
Sanded plaster . . .	80,455	1,165,771
Mixed plaster	^a 218,650	^a 1,914,572
Plaster of Paris, molding, casting plaster, etc. .	^b 126,288	^b 1,198,819
Keenes cement	21,991	324,316
Plaster board	42,088	945,171
Wall board	120,591	4,500,725
Partition tile	68,338	915,449
Roof tile	^c	^c
Special tile or blocks .	44,834	368,068
Other purposes	^d 37,779	644,542
	2,491,265	26,917,805
Crude	770,725	2,443,346
		29,361,151

^a Includes small quantity of wood fiber plaster.

^b Includes dental plaster and plaster sold to plate-glass works.

^c Included under "Other purposes"

^d Includes roof tile and material used for pointing up wall boards.

sum produced in the United States in 1922 were an increase over 1914, when the production was 2,476,465 tons. The sales of agricultural gypsum amounted to 101,904 tons, valued at \$387,203, in 1922, as compared with the 1921 sales of 104,066 tons, valued at \$490,902. Gypsum was used not only for fertilizer but in connection with insecticides and as carriers for dust sprays used in combating the boll weevil. The sales of gypsum for use in Portland cement, paint, and other compounds, however, showed an increase in quantity and in value during the period from 1914 which amounted, in 1922, to 663,821 tons, valued at \$2,056,143.

Important applications of this material were gypsum blocks or tiles for nonbearing partitions in fireproof buildings and employment in roofs and floors. Gypsum wall boards by 1924 had become an important industry. In the manufacture of gypsum, leading developments were the use of rotary calciners and ball mill grinding, as well as mechanical packers.

GYPSY MOTH. See **ENTOMOLOGY**, **ECONOMIC**.

GYRO PILOT. See **NAVIGATION**.

HAAN, WILLIAM GEORGE (1863-1924). An American army officer, born at Crown Point, Ind. He graduated from the United States Military Academy in 1889, and began his military career as Lieutenant in the 1st Artillery. He was promoted through the grades, and when the War broke out in 1914 he was a member of the General Staff. In 1917, he commanded the 57th Field Artillery Brigade at Camp MacArthur, Texas, and in 1918 the 32d Division at the Marne, Oise-Aisne, and the Meuse-Argonne offensives. He commanded the 7th Army Corps in the Army of Occupation in Germany from November, 1918, to April, 1919. On his return to the United States in 1919 he was appointed assistant chief of staff and director of war plans division of the General Staff and was made a major-general in the regular army on Mar. 8, 1921.

HAAS, ARTHUR E. (1884-). Professor of physics at the University of Vienna, born at Brunn and educated at the Gymnasium and the universities of Vienna and Göttingen. He taught at the University of Vienna in 1912, and in 1913 was appointed professor in the University of Leipzig. He returned to Vienna in 1921. He published many scientific articles, and also the following works: *Entwicklungsgeschichte des Satzes von der Erhaltung der Kraft* (1909); *Geist des Hellenismus in der Modernen Physik* (1914); *Grundgleichheit der Mechanik, dargestellt auf Grund ihrer Geschichtlichen Entwicklung* (1914); *Einführung in die Theoretische Physik* (1919); *Naturbilder der Neuen Physik* (1920).

HAASE, HUGO (1863-1919). A German politician, born at Allenstein, East Prussia, and educated at the public school, the Gymnasium, and the University of Königsberg. He began practicing law in 1889, and was a member of the Reichstag from 1897 to 1907, being elected again in 1912. In 1914 he was the leader of the Social Democratic party in the Reichstag, but in 1916 he became the leader of the Independent Socialists. After the revolution of 1918, he was chosen to be one of the six commissaries who conducted the first provisional government of the new republic. His socialistic views were rather moderate than extreme. He was fired on by an assassin on Nov. 7, 1919, and died from the wounds received.

HABER, FRITZ (1868-). A German chemist (see VOL. X). He directed the Kaiser Wilhelm Institut for physical chemistry and electrochemistry in Berlin. He specialized on electrochemical investigations and received the Nobel prize for chemistry in 1919.

HACKETT, FRANCIS (1883-). A literary critic, born in Kilkenny, Ireland. He was educated in Ireland and came to America in 1900. He was with a law firm in New York in 1902 and did editorial work for the Chicago *Evening Post*, 1906-11. He has been associate

editor of the *New Republic* since 1914. Besides his numerous articles in magazines he wrote *Ireland, A Study in Nationalism* (1918); *Horizons* (1918); *The Invisible Choir* (1920). He has been one of the exponents of the modern school of literary criticism and has devoted much attention to modern political movements. In 1924, he contributed a series of articles to the *Survey*, on the League of Nations, following his visit to the League buildings in Geneva.

HACKETT, JAMES KETeltas (1869-1926). An American actor (see VOL. X), best known for Shakespearian characterizations. He played *Macbeth* (1916); *Out There* (1918); *The Better 'Ole*; *The Rise of Silas Lapham* (1919); *Macbeth* (in London and Paris, 1920); *Othello* (Paris and London, 1922). When he returned to the United States in 1924, he was given a public reception at the New York City Hall (the first one ever accorded to an actor). During the spring of that year, he played *Macbeth* in New York, with Clare Eames as Lady Macbeth.

HADLEY, ARTHUR TWINING (1856-). An American educator (see VOL. X). Included among his recent works are *Undercurrents in American Politics* (1915), *The Moral Basis of Democracy* (1919), and *Economic Problems of Democracy* (1923). He resigned from the presidency of Yale University in 1920, and later became a director of the Atchison, Topeka and Santa Fé Railway.

HADLEY, HENRY KIMBALL (1871-). An American composer (see VOL. X). He resigned as conductor of the San Francisco Symphony Orchestra in 1915 and returned to New York, to devote his entire time to composition. In 1920, he was appointed associate conductor of the Philharmonic Society, and in 1924 also regular conductor of the Worcester Festival. In 1921 and 1922 he conducted the first half of the Philharmonic Society's series of summer concerts at the Stadium, and during the winter of 1921-22 appeared as guest conductor of the San Carlo Opera Company. He wrote four operas, which were all produced soon after their completion: *Azora, Daughter of Montezuma* (Chicago Op. Co., 1917); *Bianca* (won the Hinshaw prize, New York, 1918); *The Garden of Allah* (New York, 1918); *Cleopatra's Night* (Met. Op. House, 1920). The more important of his recent works include two overtures, *Othello* and *The Spirit of the Elements*; a tone-poem, *The Ocean*; a cantata, *Prophecy and Fulfillment*; *Ode to Music* for chorus and orchestra (Worcester Festival, 1917); and an oratorio, *Resurgam* (Cincinnati Festival, 1923).

HAFNIUM. See PHYSICS.

HAGEDORN, HERMANN (1882-). An American author, born in New York City, and educated at Harvard University, University of Berlin and Columbia University. From 1909 to 1911, he was instructor in English at Harvard. He published, among other works: *The Silver Blade* (1907); *The Woman of Corinth*

1908); *A Troop of the Guard, and Other Poems* (1909); *Poems and Ballads* (1912); *Faces in the Dawn* (1914); *You Are the Hope of the World* (1917, 1920); *Theodore Roosevelt* (1919, 1921); *That Human Being, Leonard Wood* (1920); *Roosevelt in the Badlands* (1921).

HAGEMANN, C. A. CARL (1871-). A German stage manager and author. He studied at Rostock, Berlin and Heidelberg, has managed theatres at Mannheim and Hamburg, and after 1921 was director of the principal theatre in Wiesbaden. He has written *Geschichte des Theaterzettels* (1900), *Regie, die Kunst der szenischen Darstellung* (1921), *Die Kunst der Bühne* (1923), a life of Oscar Wilde, and other works.

HAGEN, JOHANNES G. (1847-). An Austrian Jesuit and astronomer (see VOL. X). He was professor of mathematics and physics at American colleges, among them Georgetown University, and directed the observatory at the Vatican. He published *Die wunderlichen Sterne* (1920).

HAGEN, WALTER C. (1892-). An American professional golfer, born at Rochester, N. Y. He rounded out a record that never has been equaled for tournament play by winning the British open championship at Hoylake, England, in 1924, after having been the first United States player to bring this coveted trophy across the seas in 1922. He also has been the American open title holder twice, North and South open champion twice, Western open champion twice, metropolitan open champion twice, French open champion once and Professional Golf Association champion once.

HAGGARD, SIR HENRY RIDER (1856-1925). An English novelist (see VOL. X). During the War he served with the Royal Colonial Institute of which he was elected vice-president in 1917. He was also a member of the Empire Settlement Committee (1917). Among his later works are: *The Holly Flower* (1915); *The Ivory Child* (1916); *Love Eternal* (1915); *The Ancient Allan* (1920); *The Virgin of the Sun* (1922).

HAGGERTY, MELVIN EVERETT (1875-). An American psychologist. He was born at Bunker Hill, Ind., and was educated at Chicago and Harvard universities. After teaching at Indiana University, he became, in 1915, professor of educational psychology at the University of Minnesota. He was director of the psycho-educational clinics at that institution, and in 1920 he was made dean of the College of Education. After the Armistice he was attached to the Surgeon-General's office, in charge of the reeducation of disabled soldiers. He served on the Virginia Education Commission and on the school surveys of North Carolina (1920) and New York State (1921).

HAGOOD, JOHNSON (1873-). An American army officer, born at Orangeburg, N. C. He graduated from the United States Military Academy in 1896, and began his military career as second lieutenant of the 2d Artillery. He was promoted through the grades, served in the Philippines (1913-15), and commanded the First Expeditionary Brigade, Coast Artillery Corps, arriving in France on Sept. 11, 1917. He headed the board that created the service of supply and was its chief of staff until the Armistice. He took part in the Meuse-Argonne offensive, and on Nov. 30, 1918, established headquarters at Hohn, Germany. He returned to the

United States in 1919, commanded the South Atlantic Coast Artillery District during 1920-21, and was sent again to the Philippines, in November, 1921.

HAHN, HERMANN (1868-). A German sculptor, born in Bavaria. At first, he was apprenticed to a woodcarver, then studied industrial art and finally entered the Academy at Munich. He traveled in the Orient and in America. His principal works are a "Goethe" monument in Chicago (1914), "Emil Rathenau" in Berlin (1916), "Goethe" in Wiesbaden (1919), "Blucher" in Kiel (1920), and an equestrian bronze in Hamburg (1919). His most recent works are a Bavarian monument for Munich, a war monument for Ludwigshof and a monumental fountain for Cassel.

HAIG, DOUGLAS, first EARL (1861-). An English general born in Fifeshire and educated at Brasenose College, Oxford. After serving in the Sudan and in South Africa he held important posts in India, being chief of staff from 1909 to 1912. In 1912-14 he was general officer in command at Aldershot, and commanded the first army of the British Expeditionary Force in France, distinguishing himself in the retreat from Mons, at the Aisne, at Ypres and Neuve Chapelle. In 1915, he succeeded Sir John French as commander-in-chief of the Expeditionary Forces in France and Flanders, holding that post until 1919. During 1919-20, he held the office of field-marshal commander-in-chief of the forces in Great Britain. He wrote *Cavalry Studies* (1907). See WAR IN EUROPE, *Western Front*.

HAINES, THOMAS HARVEY (1871-). An American psychologist. He was born at Moorestown, N. J., and was educated at Haverford College and Harvard University. He studied neurology and psychiatry at Munich, Zurich and London, and received a medical degree from Ohio State University. He was first assisting physician at the Boston Psychopathic Hospital (1913-14) and clinical director of the Ohio Bureau of Juvenile Research (1914-17). From 1915 to 1920, he was professor of nervous and mental diseases at Ohio State University. Author of the mental deficiency bills of Tennessee and Mississippi, he took an active part in social work. His published writings include a monograph on *Mental Measurement of the Blind* (1915).

HAINISCH, MICHAEL (1856-). A president of the Austrian republic. He was a lawyer by profession and had been an official of the treasury department. For many years he took no active part in politics but devoted his time to reading and study. He was chosen Federal president in 1921, largely because of his friendliness with all political parties. He wrote many books on sociological subjects.

HAITI. An independent republic occupying the western four-elevenths of Haiti Island. Santo Domingo (q.v.) is the name of the remaining portion. Area of the republic estimated at from 10,204 to 11,072 square miles. Population in 1912 (estimate), 2,500,000; in 1923 (estimate), 2,045,000. Negroes made up 90 per cent of the population. Port-au-Prince, the capital, had 125,000 inhabitants in 1923.

Industry, Trade, Government. Agriculture continued to engage the majority of the population. Coffee culture occupied the place of leading importance, its export quantity in 1923 constituting 65 per cent of the total trade.

Other important crops were cotton, sugar, tobacco. Logwood and other valuable woods entered into the foreign trade. In 1923, exports totaled \$14,591,012, as against \$10,712,210 in 1922, and \$17,285,485 in 1913. For the same years, imports were \$14,157,963, \$12,330,271, \$9,876,555. As before, imports came largely from the United States, while the exports went to France. American intervention in 1915 led to the appointment, in the following year, of a group of American officials to the posts of financial-adviser, receiver-general of customs, chief engineer, sanitary engineer, and chief of gendarmerie. The result was an increased stability in fiscal affairs. Expenditures for 1913-14 had been \$8,127,000: revenues, \$6,282,000. In 1922-23, revenues were \$6,496,889 and expenditures \$5,818,746. In 1912, the public debt amounted to \$12,763,000 and 119,286,000 francs, besides an unfunded debt of \$7,077,000. In July, 1923, the total public debt was \$19,329,805. In October, 1922, great interest was aroused in Haitian affairs by the action of the New York National City Bank which floated for Haiti a bond issue of \$16,000,000 to be secured by a second charge on customs and a first on internal revenues. The Haitian government received 92 per cent of the nominal value. The loan was used for the conversion of outstanding loans, particularly the French loan. As a result of American activity, Haiti was provided with a well-trained constabulary, officered by American marines. The constabulary consisted of 2688 men.

History. The internal disorders and upheavals which Haiti had experienced during the preceding years continued throughout 1914. President Davilmar Theodore was overthrown on Feb. 8, 1914, by Oreste Zamor, but regained control in October, to be ousted again by Vilbrun Guillaume Sam early in March, 1915. President Guillaume succeeded at first in firmly establishing his authority, but owing to his dictatorial methods and the brutal acts committed by his followers, notably the massacre of some 200 political prisoners, he was overthrown and killed in the course of a violent uprising at Port-au-Prince at the end of July, 1915. Immediately thereupon American troops were landed and took possession of the country. Haiti had previously become involved in serious difficulties with English, French, and German creditors, and on several occasions American troops had been landed. In the spring of 1915 President Guillaume had been informed that he must turn over to United States officials the administration of Haitian customs, in order to assure payment of foreign obligations. This he had refused to accept. Following the murder of Guillaume, United States marines occupied the country. Martial law was declared without the consent of Haiti, and American officials took charge of the greater part of the administration, although the Haitian civil government remained nominally in power. On Aug. 10, 1915, Sudre Dartiguenave was elected president by the Haitian Assembly, and on Sept. 16, 1915, a convention was signed between the United States and the Haitian government. After the American forces of occupation had successfully stamped out all armed opposition in the interior, this convention was ratified by the Haitian Chamber on Oct. 6, 1915, and by the Senate on November 3. In ratifying the treaty the Haitian Assembly had been effectively coerced by

the United States withholding all funds. Pending ratification by the United States Senate, which took place in May, 1916, a *modus vivendi* was reached for the immediate application of the treaty. The provisions were as follows: establishment of a Haitian receivership of customs under American control; establishment of a native constabulary force under the command of American officers; establishment of American control over Haitian finances to an extent necessary to safeguard the interests of the Haitian people and their American creditors; a term of 10 years during which the treaty was to remain in force, with the possibility of extending it at the expiration of that period if either of the signatories should so desire. Haiti thus became an American political and fiscal protectorate for at least 10 years, during which the United States agreed to intervene for the maintenance of Haitian independence and an orderly government if that should become necessary.

On July 20, 1918, Haiti entered the War on the Allies' side, ostensibly because of the sinking by German submarines of a French vessel which had Haitian citizens aboard. During the same year a new constitution was drafted, and on submission to a plebiscite on June 19, approved by a large majority. The chief novelty of this constitution was a clause providing that foreigners residing in the country and societies formed by them should have the right to own real property. Although constitutional government was formally in existence, the actual administration was in the hands of American officials. The American occupation resulted in a marked improvement of the economic and social conditions of the country. Particularly, town sanitation and the construction of modern roads progressed rapidly. Public order was guaranteed by the establishment of an efficient gendarmerie. These benefits, obvious results of the American occupation, nevertheless failed to reconcile a large part of the Haitian people with the existing status. Charges were advanced in Haitian and American quarters that the American force of occupation, composed exclusively of whites, was guilty of revolting acts of brutality against the Negro population of Haiti. The charges resulted during 1921 in an investigation by a committee of the United States Senate, the report of which on the whole exonerated the American troops. On Oct. 9, 1922, the National City Bank of New York offered a Haitian loan of \$16,000,000 in 30-year bonds, at 6 per cent. This aroused protests from the Haitians and criticism in the United States. By the unanimous vote of the Legislature, Luis Borno was elected president on Apr. 11, 1922, to replace President Dartiguenave, whose term had expired. In the spring of 1924 the American government withdrew its forces from the interior, leaving only skeleton forces in certain seaports. At the same time it was declared that because of the inability of the Haitians to guarantee the continuance of orderly government, complete evacuation was not yet in sight.

HALBE, MAX (1865-). A German dramatist and novelist (see Vol. X). His recent works are *Io*, a novel (1918), *Schloss Zeitvorbei*, a drama (1918), *Hortense Ruland*, a tragedy (1920), and *Kikekiki*, a comedy (1921).

HALDANE, JOHN SCOTT (1860-). (See Vol. X.) This British physiologist resigned

his professorship to become director of the Mining Research Laboratory at Birmingham. After 1914, he wrote the following books: *Organization and Environment* (1917); *The New Physiology* (1919); *Mechanism, Life and Personality* (1921); and *Respiration* (1922).

HALDANE, Rt. Hon. RICHARD BURDON, first Viscount of Cloan (1856-). A British philosopher and statesman (see Vol. X). He was the host of Einstein during the visit of the famous scientist to England. In his work on *The Reign of Relativity* (1921) he sought to link the physical theory with the general philosophy of idealistic relativism. *The Philosophy of Humanism* (1922) was published as the ethical counterpart to the idealistic criticism of science. Viscount Haldane was Lord Chancellor in the Labor party government which came into office in England in 1924.

HALE, GEORGE E. (1868-). An American astronomer (see Vol. XI). He received the Bruce medal of the Astronomical Society of the Pacific in 1916, the Janssen medal of the Astronomical Society of France in 1917, the Galileo medal, Florence, in 1920, and the Actonian prize given by the Royal Institution in 1921.

HALÉVY, DANIEL (1872-). A French man of letters. He was educated at the Sorbonne, and devoted himself to history and criticism. By family tradition he inherited a cultural liberalism which was to find expression in the ideology of Dreyfusism. Before the War, he was affiliated with the group of Charles Péguy and the *Cahiers de la Quinzaine*, a fortnightly series of pamphlets, novels, and books of criticism and philosophy. After the Armistice, Halévy tried to revive Péguy's tradition on a more modest scale by editing the collection of the *Cahiers Verts*. His works include: *Essai sur le Mouvement Ouvrier en France*; *La Vie de Frédéric Nietzsche*; *Luttes et Problèmes*; *La Jeunesse de Proudhon*; *Charles Péguy et les Cahiers*; *Le Courrier de M. Thiers*; *Vaubain*; *Une Visite aux Paysans du Centre*.

HALÉVY, ELIE (1870-). A French philosophical writer. He was born at Etretat, and was educated at the Ecole Normale Supérieure. He was professor at the Ecole Libre des Sciences Politiques. His works include an analysis of Plato's philosophy of science, *La Théorie Platonicienne des Sciences* (1896); three volumes on the English utilitarians and radicals, *La Formation du Radicalisme Philosophique* (1901-04); and *Histoire du Peuple Anglais au XIX^e Siècle* (2 vols., 1913, 1923).

HALL, FRANCIS JOSEPH (1857-). An American Protestant Episcopal theologian (see Vol. X). He became professor of dogmatic theology in the General Theological Seminary in 1913. Among his later works are: *The Incarnation* (1915); *The Bible and Modern Criticism* (1915); *The Passion and Exaltation of Christ* (1918); *The Church and the Sacramental System* (1920); *The Sacraments* (1921).

HALL, GRANVILLE STANLEY (1846-1924). An American educator (see Vol. X). He became editor of the *Journal of Applied Psychology* in 1917 and has published *Jesus the Christ in the Light of Psychology* (1917), *Morale: The Supreme Standard of Life and Conduct* (1920), *Recreations of a Psychologist* (1920), and *Sensescence* (1922). He retired from the presidency of Clark University in 1920.

HALOGEN GROUP. See CHEMISTRY.

HALSTEAD, ALEXANDER SEAMAN (1861-). An American naval officer, born at Philadelphia, Pa. He graduated from the United States Naval Academy in 1883 and was promoted through the grades, becoming captain in 1911. He served in the Spanish-American War and took part in the battle of Manila Bay. After commanding several battleships, he became supervisor of New York Harbor in 1915. He attended the Naval War College at Newport, R. I. during 1916-17; was commander of the district of Brest, France, during 1918-19, and commanded the naval forces in France in 1919. In October, 1919, he became commandant of the Navy Yard at Portsmouth, N. H., and remained there until 1920, when he was appointed commandant of the 12th Naval District at San Francisco. He was raised to the rank of rear-admiral on July 1, 1919.

HAMBIDGE, JAY (1867-1924). An American artist, born in Canada. He was a pupil at the Art Students' League in New York and of William Chase, and a thorough student of classical art. He conceived the idea that the study of arithmetic with the aid of geometrical designs was the foundation of the proportion and symmetry in Greek architecture, sculpture and ceramics. Careful examination and measurements of classical buildings in Greece, among them the Parthenon, the Temple of Apollo at Bassæ, of Zeus at Olympia and Athenæ at Egina made him formulate the theory of dynamic symmetry, as demonstrated in his work, *Dynamic Symmetry: the Greek Vases* (1920). It created a great deal of discussion, an English critic saying that Hambidge did not try to formulate a new theory, but to recover a lost technique. He found a disciple in Dr. Lacey D. Caskey, the author of *Geometry of Greek Vases* (1922).

HAMILTON, JOHN McLURE (1853-). An American portrait painter and illustrator (see Vol. X). He served on the jury of awards at the Panama-Pacific International Exposition, 1915. In 1918 he was awarded a gold medal, Pennsylvania Academy of Fine Arts. A book by him, *Men I Have Painted*, appeared in 1921.

HAMILTON, SIR IAN (1853-). A British general (see Vol. X). At the outbreak of the War, he was given command of the 4th Army, which he organized in Egypt. In 1915 he was given charge of the land forces operating at Gallipoli but was relieved of this command in October of the same year. The failure of the Gallipoli enterprise resulted in severe criticism of his plan of campaign. He published an elaborate defense in the form of his *Gallipoli Diary*, in 1920. He was promoted to the rank of general in 1914.

HAMILTON COLLEGE. A nonsectarian college of liberal arts at Clinton, N. Y., founded in 1812. The enrollment increased steadily from 200 in 1914 to 350 in 1923-24. In 1922, the Board of Trustees unanimously voted to limit the number of students to 400, thereby definitely establishing Hamilton as a small college. During the decade the number of members of the faculty was increased from 20 to 31, the library from 62,000 volumes to 100,000 volumes and 25,000 pamphlets and the productive funds from \$1,100,000 to \$3,370,000. The covered playing field, called the Sage Building was completed in 1922, and in 1923-24 plans were in progress to provide a new laboratory to house the departments of biology and geology, and the

museum of natural history Frederick C. Ferry, LL.D., succeeded Melancthon W. Stryker as president in 1917.

HAMLIN, CHARLES SUMNER (1861-). An American lawyer and public official (see Vol. X). From 1914 until 1916, he was governor of the Federal Reserve Board, and was reappointed a member of the board for the term 1916-26. He published the *Index Digest of the Federal Reserve Bulletin* (1921).

HAMLIN UNIVERSITY. A coeducational college under the Methodist Episcopal Church at St. Paul, Minn., founded in 1854. The student enrollment increased from 251 in 1914 to 530 in 1923-24, the teaching staff from 15 to 38, and the annual income from \$52,000 to \$185,565. The endowment rose from \$750,000 to \$1,187,000, and a campaign for \$1,500,000 for further buildings and increased endowment was planned for the fall of 1924. A new dormitory for women was completed in 1922 at a cost of \$201,851, and a new athletic field and grandstand at a cost of \$43,000. President, Samuel F. Kerfoot, D.D.

HAMMANN, OTTO (1852-). A German journalist and politician, born at Blankenhain. He followed a journalistic career from 1877 to 1893. From 1894 until 1916, he was director of the press section of the German Foreign Office, in this capacity acting as adviser to Prince von Bülow, and, in the nineties, taking the part of Count Caprivi, the Imperial Chancellor, and Baron Marshall von Bieberstein, the Foreign Secretary, against Bismarck's followers. After the formation of the German Republic, he published three volumes of reminiscences, in which he brought to light much of what he knew about the German secret policy: *Der neue Kurs, Erinnerungen* (1918); *Zur Vorgeschichte des Weltkrieges* (1919); *Um den Kaiser, Erinnerungen aus den Jahren 1906-09* (1919).

HAMMERSTEIN, OSCAR (1847-1919). An American theatre manager (see Vol. X). For the last 15 years of his life he worked to conquer operative inertia in New York City, and with his keen understanding of the American public, he succeeded in stimulating public interest in the opera. He built the Manhattan Opera House and did much to enliven the Metropolitan Opera House, by securing many artists of note, among them Mary Garden and Tetrazzini.

HAMMOND, JOHN HAYS, JR. (1888-). An American inventor, born at San Francisco and educated at the Sheffield Scientific School of Yale University. He invented a wireless-controlled torpedo for coast defense and a system for firing torpedoes from battleships; also incendiary projectiles which were employed in the War, a radio system for the control of ships, and a system of aeroplane coastal patrol. He also took out a great number of patents for inventions in radiotelegraphy and telephony, among them being one that gives complete isolation of the sender and receiver of radio messages, so that there is no "listening in" possible. He was vice-president of the Radio Corporation of America and a member of many American and foreign organizations.

HAMOR, WILLIAM ALLEN (?-). An American chemist, born at Du Bois, Pa., and educated at the University of Pittsburgh. He was research chemist at the College of the City of New York, 1907-14, and assistant to the director of the Mellon Institute of Industri-

al Research at Pittsburgh, 1914-16. He was major in command of the Chemical Warfare Service of the United States Army in 1917 and served in France for 10 months as assistant chief of the Technical Division of the Chemical Warfare Service. He wrote. *History of Chemistry* (1909); *The American Petroleum Industry* (1916); *The Examination of Petroleum* (1920); *American Fuels* (1921).

HAMP, PIERRE (pseudonym of BOURILLON) (1876-). A French novelist. He was educated in the French technical schools and became a functionary in the railroad administration. It was there that he collected his observations for his series of impressionistic novels on *La Peine des Hommes* (Men in Labor). These novels combine, at times very successfully, a sociological documentation and artistic presentation of human experience. His works include *Marée fraîche* (1908); *Vin de Champagne* (1909); *Le Rail; Vieille Histoire* (1912); *L'Enquête* (1914); *Gens* (1917); *Le Travail Invincible* (1918); *Les Métiers Blessés* (1919); *La Victoire Mécanicienne; Les Chercheurs d'Or* (1920); *La Dérive du 4542; Compound 300 H.P. No 243; Le Cantique des Cantiques* (1922).

HAMPDEN, WALTER (1879-). An American actor born in Brooklyn, N. Y. He studied at Harvard, 1896-97, and took his bachelor's degree from the Polytechnic Institute, Brooklyn, in 1900. He first appeared on the stage in England, with F. R. Benson's company in classical repertoire, in 1901, and then for three seasons was leading man at the Adelphi Theatre in London. In 1905, he appeared in *Hamlet*, succeeding the younger Irving. He came to the United States in 1907, supporting Mme. Nazimova, and then appeared in *The Servant in the House* (1908), *The Master Builder*, *The Yellow Jacket*, *Salome*, and other plays. He toured the country widely with his Shakespearian repertoire, his *Hamlet* in particular being a vigorous, fresh, and princely interpretation. His greatest single triumph has been *Cyrano de Bergerac*, which was judged to be the outstanding play in New York City during 1923-24. With his remarkable histrionic ability and insight into character, he gives a masterly presentation of Rostand's heroic comedy.

HAMPTON NORMAL AND AGRICULTURAL INSTITUTE. This institution, situated at Hampton, Va., two miles from Old Point Comfort, was founded by Gen. Samuel Chapman Armstrong in 1868 for the practical education of Negro and Indian youth.

The school opened in 1868 with two teachers and 15 students in a plantation house, grist-mill, and army barracks. By 1924, it had developed into an industrial village, with about 2200 students (900 boarders, 400 in the Whittier Training School, and 900 in the summer school and extension classes), over 300 teachers and other workers, 149 buildings, and 1000 acres of land. There was a well-equipped trade school where 14 trades were taught, with a graduate course in the building trades. The normal, agricultural, domestic science, and business schools offered courses of collegiate grade. The Institute was controlled by a board of 17 trustees, Chief Justice Taft having been president of the board since 1914. The endowment fund, which amounted to about \$4,688,000, provided inadequate support, the budget for 1923-24

amounting to \$480,000, and the Institute was therefore partly dependent on public philanthropy. Hampton Institute was probably the first school in the country to combine successfully the training of the hand with that of the mind and character. Rev. James E. Gregg, D.D., succeeded the late Hollis Burke Frissell as principal in 1918.

HAMSUN, KNU (1859-). A Norwegian author, born in Lom, Gudbrandsdal. Son of a tailor, he became a cobbler's apprentice. At 18 he had printed a poem and a novel. Hoping to become a Unitarian minister he went to America and tried various employments, which included lecturing on French literature. He went back to Christiania and attempted authorship without success, but after three years on a Newfoundland fishing boat his writing of *Sult* at once gave him prominence among the young authors of the North. Among his best known volumes are *Shallow Soil* (1914) and *Growth of the Soil* (1920). *Pan* (1894), his first love story, was republished in 1920. *Hunger* is another of his famous books. See SCANDINAVIAN LITERATURE, *Norwegian*.

HANEY, LEWIS HENEY (1882-). An American economist, born at Eureka, Ill., and educated at Wesleyan University, Bloomington, Ill. He was a lecturer at New York University in 1908, afterwards teaching in the universities of Iowa and Michigan, and from 1912 to 1916 he was professor of economics at the University of Texas. In 1916, he was in charge of the Federal Trade Commission's gasoline investigation, and in 1920-21, he was in charge of the cost of marketing division of the United States Bureau of Markets. In 1920, he became director of the New York University Bureau of Business Research and professor of economics. He wrote *A Congressional History of Railways* (vol. i, 1908; vol. ii, 1910); *History of Economic Thought* (1911; rev. ed., 1919); *Business Organization and Combination* (1913); and various articles on economic subjects for periodicals.

HANIHARA, MASANAO (1876-). A Japanese diplomat, who came to the United States in 1902 as a member of the Japanese Embassy at Washington, was consul general at San Francisco in 1916-17, then returned to Japan as director of the Bureau of Commerce of the Japanese Foreign Office. He was a member of the Ishii Mission from which came the Ishii-Lansing agreement. He was also an influential member of the Washington Disarmament Conference. In December, 1922, he was appointed ambassador to the United States, and arrived in Washington in February, 1923. His protest, in April, 1924, on the passage of the immigration law by the United States government because it would bar the admission of Japanese to the country, was interpreted as "a veiled threat" by the Senate, and had quite an opposite effect from that intended. After the passage of the bill, it was rumored that Hanihara was to be recalled by the Japanese government. Although this was denied, it was soon announced that he would visit Tokyo on leave of absence.

HANNAY, JAMES OWEN ("GEORGE A. BIRMINGHAM") (1865-). An Irish novelist (see VOL. X). He published *Minnie's Bishop and Other Stories* (1915); *Gossamer* (1915); *The Island of Mystery* (1918); *Up the Rebels* (1919); *Good Conduct* (1920); *Lady Bounti-*

ful (1921); *A Public Scandal* (1923), and others.

HANOTAUX, GABRIEL (1853-). A French historian and diplomat (see VOL. X). He wrote, *Histoire de la Guerre de 1914*; *L'Histoire et les Historiens*; *Le Traité de Versailles*; *Histoire de la Nation Française*.

HANSEN, NIELS EBBESEN (1866-). An American horticulturist, born in Denmark. In 1873, he came to the United States and graduated from the Iowa Agricultural College in 1887. From 1891 to 1895, he was assistant professor of horticulture at the Iowa Agricultural College and from the latter date, professor of horticulture at the South Dakota Agricultural College and Experiment Station. Professor Hansen made explorations in Europe, Asia and Africa, collecting new economic seeds and plants, and originating new fruits, especially the Hansen hybrid plum. He also introduced, from Turkestan and Siberia, new varieties of alfalfa, and imported the Siberian fat-rumped sheep. He wrote numerous horticultural bulletins and papers and was also author of a *Handbook of Fruit Culture and Tree Planting* (1890), and *Systematic Pomology* (with J. L. Budd, 1903). Professor Hansen was awarded the George Robert White medal for eminent service in horticulture by the Massachusetts Horticultural Society in 1917.

HANSON, HOWARD (1896-). An American composer, born at Wahoo, Neb. Having received his first training at the Luther College Conservatory (Neb.), he continued his studies at the School of Music of the University of Nebraska, at the Institute of Musical Art in New York, under P. Goetschius, and at the Northwestern University, Evanston, under P. Lutkin and A. Oldberg. In 1916-19, he taught theory and composition at the College of the Pacific, San José, Cal., and 1919-21 was dean of the School of Fine Arts. In 1921, he was the first recipient of a newly endowed fellowship in composition, awarded by the American Academy in Rome. The fellowship, determined by a composition in a prescribed form and submitted in open competition, provides for a three years' residence in Rome, with privilege of travel, and an annual allowance of \$2000. In 1924, after his return to the United States, he was appointed director of the Eastman School of Music of the University of Rochester. He appeared as conductor of his own works with several of the leading American symphony orchestras. In 1923, he conducted a programme of American music with the Augusteo orchestra in Rome. His works include: a *Nordic Symphony*; the symphonic poems, *North and West*, *Lux Aeterna*, *Exaltation*, and *Before the Dawn*; a *Symphonic Rhapsody*; a piano concerto; two piano quintets; and *The Soul of Sequoia*, a festival play for the California Redwood Park Festival (1920). He was commissioned to write a string quartet for the Berkshire Festival of 1925 and a choral work for the Leeds Triennial Festival of 1925.

HANSON, OLE, (1874-). An American public official, born in Racine County, Wis. He was educated privately and after studying law was admitted to the bar. For many years he was engaged in real estate business in Seattle. He was a member of the House of Representatives, where he advocated measures favorable to labor. He was elected mayor of Seattle in 1918 and gained national prominence by prompt

and decisive measures in meeting and overcoming a general strike in February, 1919. He wrote *Americanism versus Bolshevism* (1920).

HAPGOOD, NORMAN (1868-). An American editor and critic (see Vol. X). He was editor of *Harper's Weekly* (1913-16), and American Ambassador from the United States to Denmark from February to December, 1919. Beginning in 1923, he was editor of *Hearst's International Magazine*.

HARA, TAKASHI (1854-1921). A Japanese prime minister. He served as an official in the Foreign Office at home and abroad, attaining the rank of vice-minister in 1895. In 1900, he was one of the organizers, together with the late Prince Ito, of the Seiyu-kai party and soon afterwards was made Minister of Communications. He held that portfolio again in the Seiyu-kai ministry of 1906-08. He was again a cabinet minister in 1915, holding the portfolio of Home Affairs and in 1918 became premier. He was strongly self-assertive as prime minister and practically dominated the government. In general, he was opposed to the too rapid absorption of European ideas. Other features of his policy were the more complete cooperation between the military and other branches of government service and a spirit of conciliation in foreign affairs. Many attempts were made to overthrow his cabinet, the opposition attacking it for its policy toward China in the matter of the 21 demands and for its Siberian policy, and demanding that the Japanese troops be withdrawn. Latterly negotiations with China over Shantung and the policy of the conference at Darien, in which Japan had hoped to come to an agreement with the Far Eastern republic of China, tended to sharpen the hostility between the political parties. His assassination, which occurred at Tokyo, Nov. 4, 1921, was just at the time when the Japanese delegation was gathering for the Washington Conference. See *JAPAN, History*.

HARAHAN, WILLIAM JOHNSON (1867-). An American railway official born in Nashville, Tenn., and educated at St. John's College, New Orleans. After holding several important positions, he was appointed chief engineer of the Illinois Central Railroad in 1902. He became general manager in 1904 and in 1907 was appointed assistant to the president of the Erie Railroad. He was vice-president of that road in 1911-12 and 1912-18 was president of the Seaboard Air Line, of which he was also Federal manager. He was a member of the United States Railway Board of Adjustment and became president of the Cincinnati and Ohio Railway and the Hocking Railway in 1920.

HARBEN, WILLIAM N (ATHANIEL) (1858-1919). An American story-writer (see Vol. X). His last three publications were *The Inner Law* (1915), *Second Choice* (1916), and *The Triumph* (1917).

HARBORD, JAMES GUTHRIE (1866-). An American army officer, born at Bloomington, Ill., and graduated from the Kansas State Agricultural College at Manhattan, Kan., in 1886 and from the Infantry and Calvary School in 1895. He joined the 4th Infantry as a private in 1889, and reached the rank of colonel in 1903, in which year he went to the Philippines where he remained till 1914. He was chief of staff in the American Army in France during 1917-18, and commanded the Marine Brigade near Château-Thierry during June and July,

1918. He also served at Soissons, and commanded the Service of Supply during 1918-19. He was chief of the American Military Commission to Armenia in 1919.

HARDEN, MAXIMILIAN (ISIDORE WITTKOVSKY) (1861-). A German journalist and author (see Vol. X). It is said that during the War Harden was the most famous, feared, admired, and hated journalist in Europe. Ex-Ambassador Gerard declared that Harden voiced the only protest in Germany against the sinking of the *Lusitania*. He praised China for her anti-German attitude, admired President Wilson whenever he did anything especially obnoxious to Prussian pride, scoffed at the idea of a victorious German peace, and, in fact, made each copy of his newspaper *Die Zukunft* (which he had founded in 1892) of especial interest to German statesmen. The intrepid editor was put in jail at various times, but no physical harm came to him till 1922, when an attempt was made to assassinate him. He was twice suggested for the post of ambassador to the United States, once in 1919, and again in 1921.

HARDING, WARREN GAMALIEL (1865-1923). The 29th President of the United States, elected in November, 1920. He was born at Corsica, Morrow Co., Ohio, Nov. 2, 1865, and studied at the Ohio Central University. Entering the newspaper business, he became editor and publisher of the Marion (Ohio) *Star*. He ran for the office of governor of Ohio in 1910, but was defeated. In 1914, he was elected a Republican member of the United States Senate for the term of 1915-21. He nominated Mr. Taft in 1912 and was chairman of the Republican Convention in 1916, making the keynote speech. In politics he belonged to the "stand-pat" element which was bitterly opposed to the "insurgents" led by Roosevelt. He was a strong supporter of President Wilson's war policies during the conflict, but in the treaty fight he stood with Senator Lodge and signed the famous "round-robin" disapproving the linking of the League of Nations with the Peace Treaty. He voted for the submission of the Prohibition and Woman Suffrage Amendments, and in general supported the policies of the majority of his party. In 1920, through the efforts of his friend, Harry M. Daugherty, afterwards Attorney General, he was put forward prominently as a candidate for the Presidency. At the convention he was nominated on the 10th ballot, receiving 692½ votes. His selection was somewhat of a surprise to the people at large. The most difficult question before the Republican candidate was that of the League of Nations. A strong element in the Republican party was bitter against any form of participation, whereas a smaller but more influential body, represented by such men as Mr. Hughes, Mr. Hoover, and Mr. Root, favored some sort of cooperation. Mr. Harding put forward the idea of an association of nations to which the United States would belong but reserving the right of independent action, and he also favored an international court of justice. During the two years before his death, signs of revolt against the Republican organization were evident, and in 1922 the Republican majority in the House was greatly reduced in the Congressional elections. An agricultural bloc was forming in Congress as a result of the dissatisfaction of the farmers, especially those in the West.

Shortly before President Harding's death, Shipstead and Magnus Johnson were elected to the Senate and a new third party movement was threatened. The most conspicuous feature of the latter days of his administration was his advocacy of the Permanent Court of International Justice, which was sharply attacked by Senators Johnson, Borah, and other irreconcilables. President Harding died at San Francisco, Cal., on Aug. 2, 1923, on his return trip from Alaska.

HARDING, WILLIAM P. G. (OLD) (1864-). An American banker born in Greene County, Ala. After graduating from the University of Alabama he entered the bank of J. H. Fitts and Company at Tuscaloosa, from there went to the Berney National Bank at Birmingham, Ala., and from 1902 to 1914 was president of the First National Bank of Birmingham. He became a member in 1914, and governor in 1916, of the Federal Reserve Board at Washington, and has been closely associated with financial transactions of the United States Government. He was managing director of the War Finance Corporation in 1918-19.

HARDY, THOMAS (1840-). An English novelist (see Vol. X). His already long list of works was lengthened by *Selected Poems* (1916), *Moments of Vision* (1917), and *Late Lyrics* (1922). *The Dynasts* was produced at the Kingsway Theatre, London, early in the War, and again in London in 1920.

HARKINS, WILLIAM DRAPER (1873-). American university professor and eminent chemist, born at Titusville, Pa. He was graduated from Stanford University in 1900, after which he studied at the University of Chicago, Massachusetts Institute of Technology, and at Karlsruhe, Germany. He began his teaching career as instructor of chemistry at Stanford University in 1898, and in 1900 was made head of the department of chemistry in the University of Montana. He was chemist in charge of the Anaconda Farmers' Association's investigation of smelter smoke from 1902 to 1910, and did research work for the Carnegie Institution at Washington in 1911. He was professor of physical chemistry at the University of Chicago in 1917. He gave many lectures on industrial research, was editor of the section on general and physical chemistry of *Chemical Abstracts*, and wrote many technical papers giving the results of original researches.

HARRIES, GEORGE HERBERT (1860-). An American general, born at Haverfordwest, in Wales. In 1895-96, he was president of the Metropolitan Railroad Company of Washington, and from 1897 to 1915 commanded the military and naval militia of the District of Columbia. During the Spanish-American War he was colonel of the 1st District of Columbia Infantry, United States Volunteers. In the recent War he served as a brigadier-general of the United States Army in 1917. He acted as chief of the United States Military Mission at Berlin, Germany, in 1918-19, and was appointed brigadier-general of the Officers' Reserve Corps in 1920. He was national commander-in-chief of the Military Order of the World War, 1920-22, and held office in many important organizations.

HARRIS, CORRA MAY (1869-). An American author (see Vol. X). Her later books include: *The Co-Citizens* (1915); *A Circuit Rider's Widow* (1916); *Making Her His Wife* (1918); *From Sunup to Sundown* (1919);

Happily Married (1920); *My Son* (1921); *The Eyes of Love* (1922); *A Daughter of Adam* (1923); *My Book and Heart* (1924).

HARRIS, WILLIAM LAUREL (1870-). An American mural painter (see Vol. X). He completed during this period his mural painting and decoration in the Paulist Church, New York, and fulfilled a similar commission for the Corpus Christi Chapel in that city.

HARRIS, FRANK (1856-). An English author (see Vol. X). Among his later works were *The Life and Confessions of Oscar Wilde* (1916), and *Contemporary Portraits* (1919, 1921).

HARRIS, HAROLD R. (?-). An American airman who made a world's record for speed for 1000, 1500 and 2000 kilometers at Dayton, Ohio, in 1923. He also made a record for duration, with a useful load of 551 pounds, on Mar. 27, 1924. Previously he held the records for duration and altitude with useful loads of 4408 and 6612 pounds respectively.

HARRIS, JAMES ARTHUR (1880-). An American botanist and statistician, born at Plantsville, Ohio. He was educated at the University of Kansas and at Washington University (Ph.D., 1903). He was assistant in botany (1901-03) at the Missouri Botanical Garden, instructor (1903-07) at Washington University, and botanical investigator at the Station for Experimental Evolution at Cold Spring Harbor, L. I. (1907-). His published work was mainly in biometry.

HARRISON, FRANCIS BURTON. See PHILIP PINES.

HARRISON, FREDERIC (1831-1923). A leader of the English Positivists, and philosophical writer (see Vol. X). During the War he was active in the anti-German propaganda, having been a constant critic of British indifference to the German peril, and having written for many years on the subject of the dangers of German imperialism. In 1917, in an open letter he urged the Allies to bind themselves to make no terms of any kind with the Hohenzollern or any other ruling house in Germany, all of whom he declared to be "treacherous, bloodthirsty, satanic." One of his sons lost his life in the war. Among his later works may be mentioned: *The German Peril* (1915); *On Society* (1918); *Jurisprudence and Conflict of Nations* (1919); *Obiter Scripta* (1919); *Notissima Verba* (1920).

HARRISON, HENRY SYDNOR (1880-). An American novelist (see Vol. X). His later works include *Angela's Business* (1915), *When I Come Back* (1919), *Saint Cecilia* (1922), and *Marriage* (1923), a volume of short stories.

HARSHBERGER, JOHN WILLIAM (1869-). An American botanist (see Vol. X). From 1911, he was professor of botany at the University of Pennsylvania, and from 1913 to 1921 he was in charge of ecology at the Marine Biological Laboratory, Cold Spring Harbor, L. I. He was a president of the Philadelphia Natural History Society, and a vice-president of the Ecological Society of America. Included among his later books are: *Vegetation of South Florida* (1914); *The Vegetation of the New Jersey Pine Barrens* (1916); *Pastoral Agricultural Botany* (1920).

HART, ALBERT BUSHNELL (1854-). An American historian (see Vol. X). Among his later works are: *Monroe Doctrine* (1915); *New American History* (1917); *School History of the United States* (1917); *America at War*

(1917), *Causes of the War* (1920). In addition, he edited *American Patriots and Statesmen* (1916). A discussion arose in 1923 as to the "Americanism" of his history textbook, *The Epoch of American History and National Ideals of History Traced*. The removal of his *School History of the United States* from New York City schools was recommended by an investigating committee.

HART, HASTINGS HORNELL (1851-). An American social worker, born at Brookfield, Ohio, and educated at Oberlin College and Andover Theological Seminary. He was ordained to the Congregational ministry in 1880. From 1883, when he became secretary of the Minnesota State Board of Corrections and Charities, he was identified with social work in the Illinois Children's Home and Aid Society, the Russell Sage Foundation, and other organizations. Among his numerous works are: *Preventive Treatment of Neglected Children* (1910); *A Social Welfare Programme for the State of Florida* (1918); *How to Give Wisely \$25,000 to \$1,000,000* (1921); *The Third Degree: Methods of Obtaining Confessions and Information from Persons Accused of Crime* (1921); *Employment for Jail Prisoners in Wisconsin* (1922).

HART, WILLIAM S. (1870-). An American motion picture actor born in Newburgh, N. Y. He began his work in motion pictures in 1914 after having acted on the legitimate stage for many years. He has appeared chiefly in Western pictures, among his best being *O'Malley of the Mounted* and *Travelin' On*. His most recent pictures are *Wild Bill Hickok*; *Singer Jim McKee*; *A Lighter of Flames*.

HARTFORD. The capital of Connecticut. The population increased approximately 40 per cent from 98,915 in 1910 to 138,036 in 1920. The number of persons engaged in manufacturing increased from 14,627 to 17,137 in 1917 and 26,264 in 1919; between 1909 and 1919, the value of the industrial products rose from \$40,500,000 to \$118,000,000. Bank clearings rose from \$261,494,106 in 1914 to \$567,980,369 in 1923, and deposits in discount banks from about \$46,000,000 to \$86,201,484; savings deposits increased from \$419.66 per capita in 1915 to \$612.85 per capita in 1924. The assets of the Hartford insurance companies increased from \$462,160,129 to \$1,084,057,101; \$1,088,071,199 was paid to policyholders and beneficiaries during the period. Several large office and commercial buildings were constructed.

HARTS, WILLIAM WRIGHT (1868-). An American army officer, born at Springfield, Ill., and graduated at the United States Military Academy. He had a long and varied career in the Engineers Corps of the United States Army, assisting or being in charge of construction work in nearly every part of the United States. President Wilson appointed him military aide in charge of public buildings and grounds, with rank of colonel, from 1913 to 1917. He built the Lincoln Memorial, the Arlington Memorial and the Red Cross Building. In 1917, he went to France with his regiment. He was chief of the American Mission at the British headquarters in 1918, and chief of staff, Army of Occupation in Germany, during 1919-20.

HARVARD UNIVERSITY. A nonsectarian, endowed, educational institution at Cambridge, Mass., founded in 1636. Many changes

were made in the methods of teaching and requirements for admission and graduation in the various departments at Harvard during the decade 1914-24. Important additions were made to the library and the several museums, and various schools were established or reorganized. A number of new buildings were completed and several private dormitories were purchased by the university. Partly through independent gifts and partly through the endowment fund campaign, begun in 1917 but postponed because of the War until 1919, the productive funds of the university were increased during the 10-year period, until the endowment in 1924 was in the neighborhood of \$55,000,000. The number of members of the teaching staff was increased during the period from about 800 in 1914 to 1057 in the year 1923-24, and the students in the university in the same period increased from about 4266 to 6733. Voting by alumni by postal ballots for overseers, who form one of the two governing boards of the university, was inaugurated in 1922.

Among the important changes in Harvard College was the additional method of admission, instituted as an experiment in 1923, whereby pupils having satisfactorily completed an approved school course, and ranking scholastically among the highest seventh of their graduating class, may, on the recommendation of their school, be admitted without examination. All seniors in the college, except those specializing in mathematics or the natural sciences, were required to pass general examinations in the field of their concentration, not only covering the courses taken by the individual, but requiring outside reading as well. This was an extension of the policy successfully practiced for a number of years in other divisions; it was first instituted in the division of history, government and economics in 1916, and gradually extended. The plan included the increasing use of the tutorial system, which was developed over a period of years, and in 1924 was to be extended to the division of modern languages.

The Engineering School as such, awarding the degree of S.B. after four years of undergraduate study, as well as higher degrees, was reorganized at Harvard in 1918, although the teaching of engineering at the university went back to 1847 and the founding of the Lawrence Scientific School. In 1920, it adopted new methods of instruction, training the students partly in the classrooms and partly in the neighboring industrial and engineering concerns, thus combining theoretical and practical experience. In the same year, it joined with the Graduate School of Business Administration in laying out a five-year programme of study in "business engineering."

Three other schools in the university were established during the decade. The Graduate School of Education for both men and women was founded in 1920, partly through the assistance of the General Education Board, and largely through money obtained by the endowment fund campaign. It was a school for the professional training of teachers, principals, and school superintendents, and for research in educational problems. In 1922, pursuant to an agreement between the Harvard Divinity School and the Andover Theological Seminary, the Harvard Theological School, nondenominational in policy, was organized, with Rev. Willard L. Sperry as dean. The School of Public Health,

closely allied with the Medical School, was also established in 1922 with the gift of \$2,000,000 from the Rockefeller Foundation, its dean being Dr David L. Edsall, dean also of the Medical School. The Dental School raised its standard of admission in 1921 by establishing as a prerequisite of enrollment at least one year of college work. In 1914, the faculty of architecture, in charge of the School of Architecture and the School of Landscape Architecture, was instituted as a separate faculty. In the Graduate School of Business Administration, instruction by the case system, such as was used in the Law School, was extended greatly during the decade.

The exchange of professors with France and with western colleges was continued; and in 1923, the exchange of tutors with English universities, a new departure along the lines of the established practice of exchanging professors, was inaugurated as an experiment.

During the War, and for some months before the entrance into it of the United States, Harvard maintained a Reserve Officers' Training Corps unit trained by six disabled French army officers. In 1919, this was changed to an artillery unit with courses counting toward the college degree. The college also offered a course in 1917-18 preparing undergraduates for admission to the Naval Reserve as ensigns, and courses in military and naval science and tactics.

A number of physical changes were made in and about the university. The Harry Elkins Widener Memorial Library was dedicated in 1915, as was the Cruft Memorial Laboratory for high frequency electrical work. In 1915, the rebuilding of the Gray Herbarium was completed, and the Dudley Memorial Gate and Clock Tower was built. The three freshman halls, Standish, Gore, and Smith, were occupied in 1914 for the first time. Other buildings completed between the years 1914 and 1924 included the Germanic Museum, the music building, containing the John Knowles Paine Concert Hall, the Dunbar Laboratory for research in cryogenic engineering, the *Crimson* building, which housed the undergraduate daily paper and the alumni weekly, and two war buildings still in use, that on the Delta used as the bursar's office, and the McKay Engineering Laboratory.

The commencement exercises, formerly held in Sanders Theatre, were transferred to the Harvard Stadium in 1916 for one year, and to Sever Quadrangle in the Harvard Yard in 1923. President, A. Lawrence Lowell, LL.D.

HARVEY, GEORGE (BRINTON MCCLELLAN) (1864-). An American editor and diplomat (see Vol. X). While at the Court of St James (1921-23), he was very much criticized in the United States for his obvious pro-British sentiments. He strongly opposed the League of Nations on the basis that it would jeopardize national sovereignty. In 1918, he established a *War Weekly Supplement to The North American Review*, and later called it *Harvey's Weekly*. The latter was used as a means of denouncing President Wilson's administration. Though not a delegate at the Republican National Convention of 1920, he was present and contributed largely to Warren Harding's nomination for the Presidency. The latter appointed him ambassador to England in 1921.

HASKELL, WILLIAM NAFEW (1878-).

An American army officer, born at Albany, N. Y. He graduated from the United States Military Academy in 1901; from the Infantry and Cavalry School in 1904, and from the Army Staff College in 1905. He was made captain in 1916 and in 1917 was appointed major of field artillery in the National Army. He served throughout the War, becoming lieutenant-colonel in the regular army in 1920. In France, he served as assistant chief of staff with the 77th Division and participated in several important campaigns. Following the close of the war, he acted as head of the American Relief Commission to Rumania and was later director-general of all relief in the Caucasus. In 1921-22 he served as chief of the American Relief Commission to Russia.

HASKINS, CHARLES HOMER (1870-). An American educator, born at Meadville, Pa. He graduated from Johns Hopkins University in 1887 and was instructor from 1889 to 1890. He served as instructor, professor of history and professor of European history at the University of Wisconsin from 1892 to 1902. In that year he joined the faculty of Harvard University as lecturer on history, becoming successively professor of history and Gurney professor of history and political science (1912). From 1918, he served as dean of the Graduate School of Arts and Sciences. In 1918-19, he was a member of the American Commission to Negotiate Peace and was also on several other commissions in Europe. From 1920, he was chairman of the American Council of Learned Societies and was a member of many foreign and American learned societies. He was the author of *The Normans in European History* (1915), *Norman Institutions* (1918), and *Some Problems of the Peace Conference* (with R. H. Lord, 1920). He was also editor of the *American Historical Series*.

HASSALL, ARTHUR (1853-). English historian (see Vol. X). In 1918, he wrote *France, Medieval and Modern*; in 1919, *A Handbook of British History*.

HASSAM, CHILDE (1859-). An American painter and etcher (see Vol. X). Especially interesting among his works during the decade were his flag pictures of Fifth Avenue, in which, with vitality and great effectiveness he caught the exultant spirit of flowing banners, as in "Allies Day." Within the decade he turned also to etching, his work in which was notable for its reticence and subtlety. Several important exhibitions of his drawings, etchings and water colors were held in New York. Among his awards during the period were the Altman prize, National Academy of Design, 1918; and the gold medal of honor, Pennsylvania Academy of Fine Arts, 1920. In 1919 he was made a member of the American Academy of Arts and Letters.

HASTINGS, JAMES (1860-). Scottish editor and Biblical scholar (see Vol. X). Besides continuing the series of dictionaries and encyclopædias begun some years ago, he started a series on *Great Christian Doctrines*, of which have appeared: Vol. I, *Prayer* (1915); Vol. II, *Faith* (1919); Vol. III, *Peace* (1921).

HASTINGS, THOMAS (1860-). An American architect (see Vol. X), member of the firm of Carrère and Hastings. He was a member of the National Academy and the American Academy of Arts and Letters, and was president of the Society of Beaux Arts Archi-

teets. In 1924, a design made by him for the war memorial for New York City was accepted.

HATCH, WILLIAM HENRY PAINE (1873-). An American theologian, born in Camden, N. J. He was graduated at Harvard in 1898, and received there his Ph.D. in 1904, after which he was graduated at the Episcopal Theological Seminary in Cambridge, Mass., and from the General Theological Seminary in New York City. After ordination to the Protestant Episcopal ministry in 1902, he held charges in Cambridge, Mass. (1902-03), Lake George, N. Y. (1904-05), and Lexington, Mass. (1905-08). In 1909, he went to the General Theological Seminary, becoming in 1913 professor of the language and literature of the New Testament. In 1917, he relinquished that place to accept a call to a similar chair in the Episcopal Theological Seminary in Cambridge. Dr. Hatch has published many articles and reviews and is the author of *The Pauline Idea of Faith* (1917), and with C. C. Edmunds, *The Gospel Manuscripts of the General Theological Seminary* (1918).

HAUK, MINNIE (1852-). An American soprano (see VOL. X). In the fall of 1912, a false report of her death was circulated in all the musical journals of the English-speaking world. The fact that this report was unfounded did not become known until in December, 1919, some friends issued a general appeal for assistance, as the artist had become destitute through the War and was almost totally blind. The appeal met with a generous response. In 1923, it was reported that a successful operation had brought about an improvement in her sight.

HAUPTMANN, GERHART (1862-). A German poet, dramatist, and novelist (see VOL. X). At the outbreak of the War he had a controversy with Romain Rolland, who had challenged him to protest against the crime of Louvain, which Hauptmann failed to do. Later he engaged in welfare work and was particularly active in caring for the wounded during the revolution in Berlin in 1919. His later writings comprise: *Der Bogen des Odysseus* (1914); *Parsival* (1915); *Der Ketzer von Soana* (1918); *Indipohdi* (1920); *Der weisse Heiland*, a dramatic phantasy (1920); *Anna*, a rural epic (1921); *Peter Brauer* (1921); *Phantom*, memoirs of a convict (1922); and *Kaiser Mazens Brautfahrt* (1924). Many of the addresses and lectures delivered by him during the last years have also been published. English translations of his works appeared in London and New York.

HAUSER, HENRI (1866-). A French historian and economist. He was educated at the Ecole Normale Supérieure, and passed through the academic hierarchy until he became professor at the faculty of letters in the Sorbonne. For the year 1922-23, he was the French visiting professor at Harvard University, lecturing on the history of capitalism.

An authority on the economic history of the latter Middle Ages and the Renaissance, Professor Hauser wrote illuminatingly on social conditions both of the past and present. During the War he published a number of tracts exposing Germany's plans for economic domination of the world's markets.

His works include: *François de la Noue* (1893); *Ouvriers du Temps Passé; XV^e-XVI^e Siècles* (1899); *L'Or* (1901); *L'Impérialisme Américain* (1905); *Les Sources de l'Histoire*

de France au XVI^e Siècle (4 vols., 1906-15); *Etudes sur la Réforme Française* (1909); *La France et ses Colonies* (1912); *Le Traité de Madrid et la Cession de la Bourgogne* (1912); *La Guerre Européenne et le Problème Colonial* (1915); *Economic Germany* (Eng. trans. 1915); *Germany's Commercial Grip Upon the World* (Eng. trans., 1917); *Les Routes Fluviales de l'Europe Nouvelle* (1918); *Propos d'un Ignorant sur l'Economie Nationale* (1923); *La Nouvelle Orientation Economique* (1924).

HAUSER, OTTO (1876-). An Austrian writer. He was born at Dianesch, Croatia, and studied at the University of Vienna. He is the author of *Weltgeschichte der Literatur* (1910); *Rassebücher, Rasse und Rassefragen* (1913); *Geschichte des Judentums* (1921), and other works of a critical and historical character. He translated Verlaine, Rossetti, Swinburne, Wilde, Van Eeden and others, prefacing the translations by illuminating essays, and compiled anthologies of Chinese, Japanese and Scandinavian poetry with appropriate appreciations. He has published his own works of fiction which include: *Lehrer Johannes Johansen* (1902); *Ein abgesetzter Pfarrer* (1904); *Lucidor der Unglückliche* (1905); *Angelika und Malvine* (1906); *Spinosa* (1908); *Die Familie Gessner* (1909); *Alt Wien* (1910); *Faustulus* (1911); *Der liebe Augustin* (1913); *Das Deutsche Herz* (1921); *Atlantis* (1921).

HAUSMANN, ERICH (1886-). A German physicist, born in Solinger, Germany. He was graduated at the Brooklyn Polytechnic Institute in 1908, then studied at New York University. Returning to the Polytechnic Institute he taught physics and electrical engineering, becoming professor of physics in 1918. In addition, he was a member of the graduate faculty at New York University during 1911-16 and was in charge of the department of physics during the summer of 1912. He specialized on methods of electrical communication transmission and traction, and on wave propagation along conductors. Dr. Hausmann has been very active in the Brooklyn Institute of Arts and Sciences, serving as vice president of its department of electricity (1909-21), and later as president. He is the author of *Electric Wave Propagation and Distribution along Conductors* (1911), *Telegraph Engineering* (1915), *Dynamo Electric Machinery* (1922), and, with others, of *Alternating Current Machines* (1908), *Direct Current Machines* (1909), *Electric Traction and Transmission Engineering* (1912), and *Physics Laboratory Experiments* (1917).

HAVERFORD COLLEGE. An institution under the control of the Society of Friends at Haverford, Pa., founded in 1833. Haverford grew steadily during the decade 1914-24 with the exception of the war years. At the beginning of that period, the enrollment was 176, the faculty numbered 22, the library contained 62,000 volumes and the productive funds amounted to \$1,100,000; and in the year 1923-24, the enrollment was 224, the faculty numbered 25, the library contained 93,000 volumes and the productive funds had trebled, totaling \$3,648,952. The Isaac Sharpless Science Hall for physics and biology was built in 1919, and the children of Gideon Scull gave \$146,000 in 1916 to establish a chair in English Constitutional History. William Wistar Comfort, Ph.D., LL.D., succeeded Isaac Sharpless, Sc., LL.D., as president in 1917.

HAWAIIAN ISLANDS, or **HAWAII** A territory of the United States, consisting of a group of islands in the north central Pacific Ocean. Total area. 6449 square miles. The population of Hawaii increased from 191,909 in 1910 to 255,912 in 1920. The population on June 30, 1923, was estimated at 298,500. There is a great diversification of races among its population, and with the exception of the native Hawaiians, all are increasing. The Japanese form the largest proportion; they numbered 79,675 in 1910, and 109,274 in 1920. The Portuguese are second, with 22,301 in 1910 and 27,002 in 1920. The native Hawaiians decreased from 26,041 in 1910 to 23,723 in 1920. The other races forming the population, with their numbers, in 1910 and 1920, are as follows: Asiatic Hawaiian, 3734, 6955; Caucasian Hawaiian, 8722, 11,072; Porto Rican, 4890, 5602; Spanish, 1190, 2430; other Caucasian, 14,867, 19,708; Chinese, 21,674, 23,507; Filipino, 2361, 21,031; Korean, 4533, 4950; negro, 695, 348; all other, 310, 876.

Agriculture. The agriculture development of the Territory is under the Bureau of Agriculture and Forestry and the College of Hawaii. In addition to these, there are the Federal Experiment Station which is assisted financially by the Territory and the Hawaiian Sugar Planters' Association's Experiment Station, which meets the needs of the sugar industry. Up to July 1, 1915, the work of the Bureau was supported by a special income tax. Following that year, specific appropriations were made out of the general revenues. The United States census of 1910 showed a total area of 305,053 acres of cultivated agricultural lands in the Territory. The maximum of the possible cultivable land is about 400,000 acres. The number of farms in the Territory increased in the decade 1910-20 from 4320 to 5284. The land in farms increased from 2,590,600 acres in 1910 to 2,702,245 in 1920, while the improved land in farms increased from 305,053 acres in 1910 to 435,242 acres in 1920. The percentage of the total area, in farms increased from 62.8 per cent in 1910 to 65.5 per cent in 1920. The value of farm property increased from \$96,363,229 in 1910 to \$151,129,085 in 1920, and the average value per farm increased from \$22,306 in 1910 to \$28,601 in 1920. The chief agricultural industry in the islands was the growing of sugar cane. The acreage under cultivation in 1909 was 156,230, and the sugar cane was harvested in 1919 from 123,165 acres. The production of sugar cane increased from 4,240,238 tons in 1909 to 4,862,707 tons in 1919, while the value increased from \$26,305,747 in 1909 to \$37,558,265 in 1919. The rice production was second in importance. Rice is the most important cereal grown. The acreage, however, decreased from 9425 in 1909 to 5801 in 1919. The production decreased from 41,827,900 pounds in 1909 to 29,571,845 pounds in 1919, while the value decreased from \$1,068,293 in 1909 to \$1,577,421 in 1919. The production of coffee showed remarkable development during the decade. The acreage increased from 3727 in 1909 to 5687 in 1919, while the production increased from 9,834,026 pounds in 1909 to 19,883,650 pounds in 1919. The value increased from \$213,085 in 1909 to \$741,315 in 1919. The production of fruits of all kinds was one of the chief industries of the island. The growing and canning of pineapples assumed great impor-

tance. This increased from 12,361,695 pounds in 1909 to 299,981,433 pounds in 1919, while the value increased from \$331,162 in 1909 to \$3,545,385 in 1919. Other fruits produced were avocados, bananas, figs, oranges and papayas. The number of farm owners increased from 963 in 1910 to 1419 in 1920. The managers decreased from 249 in 1910 to 126 in 1920, and the tenants increased from 3108 in 1910 to 3739 in 1920. The white farmers increased from 753 in 1910 to 892 in 1920; the colored farmers from 3567 in 1910 to 4392 in 1920. The Department of Agriculture and Forestry and the Agricultural Experiment Station did work with excellent results, especially in the decade 1914-24. Largely through the efforts of the Agricultural Experiment Station, agriculture became more diversified. Twenty years ago sugar was the only large agricultural industry. Through the experiments carried on, it was discovered that pineapples could be grown with great success, and the rapid growth of this industry is shown by the fact that the canned pineapples produced in 1903 were valued at \$7500, whereas the value in 1921 was \$29,841,000. The Experiment Station was particularly successful in discovering and destroying plant pests which were destroying sugar cane and fruits. An Extension Division was established in 1914 and during the decade developed numerous helpful points of contact with the various agricultural interests throughout the country.

Manufactures. The chief industries of Hawaii were based largely on the production of sugar. The number of establishments decreased from 500 in 1909 to 496 in 1919. The wage earners, however, increased during the same period from 5904 to 9969. The capital invested was \$23,875,000 in 1909 and \$48,851,000 in 1919. The value of products increased from \$47,404,000 in 1909 to \$133,096,000 in 1919. There were 43 establishments in 1919 connected with the manufacture of sugar, compared with 46 in 1909. The value of the products of these increased from \$35,959,822 in 1909 to \$80,236,244 in 1919. In 1909, there were 74 establishments engaged in the cleaning and polishing of rice, as compared with 69 in 1919. The value of the product increased from \$2,238,667 in 1909 to \$5,436,455 in 1919. Ten establishments in 1909 were engaged in canning and preserving, as compared with nine in 1919. The value of the product increased from \$1,591,073 in 1909 to \$18,997,975 in 1919. These industries practically comprised the most important part of the manufacturing done in the Territory. Printing and publishing, cleaning and polishing of coffee, the production of lumber, the making of confectionery and ice-cream were other manufacturing industries. Honolulu and Hilo are the chief manufacturing cities. In Honolulu, in 1909, there were 236 establishments and 241 in 1919. Hilo had no manufactures in 1909, but had 57 establishments in 1919. The value of the manufactures of Honolulu increased from \$10,704,744 in 1909 to \$43,611,175 in 1919. The industries of Hilo had a product valued at \$5,612,196 in 1919.

Education. The educational problems of Hawaii were unusually difficult from the mixture of populations, and the Territory's comparatively rapid increase. There were 161 schools in 1913, and 25,631 pupils. The cost of maintenance was \$677,799. In 1923, there

were 175 public and 60 private schools. In the public schools were 48,730 pupils and in the private schools 8470, or a total of 57,200. In 1914, there were, in the public schools, 10,329 Japanese. This number had increased in 1923 to 23,947. The Chinese increased from 2638 in 1914 to 4616 in 1923. The Hawaiians increased from 3288 in 1914 to 3565 in 1923. The Anglo-Saxons increased from 737 in 1914 to 1448 in 1923. During the decade 1913-23, great attention was given to the proper development of the educational system, especially with regard to agriculture and manual education. In the latter part of the period, widespread interest was manifest in a reorganization and re-direction of the public school curriculum for the purpose of giving adequate recognition to agricultural and manual training. One of the most significant educational developments over the period was the rapid rise of professional interest and self-improvement on the part of the teaching staff. The Hawaiian Educational Association, which embraces the whole Territory, held annual conventions. The junior high schools were established during the decade and these became very popular among the people and greatly increased the interest in educational work wherever established. In 1923, there were five of these schools. The University of Hawaii, established in 1907, formerly the College of Hawaii, afforded opportunity for higher education. The enrollment increased from 144 in 1914 to 701 in 1923. The relations of the university and the community at large became much closer through the work of the extension department. Two industrial schools, one for boys and one for girls, were also maintained.

Trade and Commerce. The development of trade and commerce in the decade 1913-23 is indicated by a comparison of several years during that period. In 1914, the total of imports and exports amounted to \$77,144,329, of which \$41,594,072 were exports and \$35,550,257 imports. In 1918, the total trade was \$132,347,810, of which \$80,546,606 were exports and \$51,801,204 imports. In 1920, the total trade amounted to \$168,063,451, of which \$104,779,804 were exports and \$63,283,647 imports. In 1923, the total trade amounted to \$147,645,131, of which \$72,768,317 were exports and \$64,876,814 imports. The exports to the United States in 1914 amounted to \$40,678,827 and the imports from the United States to \$29,267,699. In 1923, the exports to the United States amounted to \$81,495,984 and the imports from the United States to \$56,837,991. The total amount of raw sugar exported increased from 1,089,389,928 pounds, valued at \$32,108,518 in 1914, to 1,193,351,278 pounds valued at \$54,232,769 in 1923. Fruits and nuts exported in 1914 were valued at \$5,061,525 and in 1923 at \$24,122,234, constituting the two largest groups of export. Other important exports were coffee, rice, and hides. By far the largest trade was carried on with the United States, but there were important trade relations with Australia, British India, Canada, Japan and the United Kingdom.

Transportation. The mileage of steam railroads in Hawaii increased from 307.43 in 1914 to 335.72 in 1923. There were steam railroads on all the islands operating on regular schedules, most of them carrying passengers. In addition, plantations possessed their private railway

equipment for transporting cane and laborers. Passengers carried on all the railroads increased from 1,345,055 in 1914 to 1,958,548 in 1923. The only street railway existing in the Territory was in Honolulu, where an electric line was being operated. Traffic with the mainland was maintained by a number of steamship lines from New York and the west coast of the United States. In 1922, direct passenger and freight service was established between Los Angeles and Honolulu. Inter-island service was maintained by large and well-equipped steamboats.

Finance. The bonded debt of Hawaii at the beginning of the fiscal year 1914-15 was \$6,844,000. This was increased, until on June 30, 1920, it amounted to \$10,894,000. Further increases brought the bonded outstanding debt, on July 30, 1923, to \$14,649,000. A large part of this debt was incurred for public improvement and authorized by the Legislature during the decade 1913-23. The increase in receipts and disbursements during the decade will be noted by a comparison of the figures for several years of the period. In the fiscal year 1914-15, the total receipts amounted to \$4,905,149 and the disbursements to \$4,446,415. For the fiscal year 1920, the receipts amounted to \$10,925,406 and the disbursements to \$10,949,897. In 1923, the total receipts amounted to \$12,996,542 and the disbursements to \$11,533,819. The gross assessed value of real and personal property increased from \$161,187,226 in 1914 to \$293,104,297 in 1923. The taxes collected on real property increased from \$1,068,297 in 1914 to \$4,726,256 in 1923. On personal property the taxes increased from \$868,613 in 1914 to \$3,503,124 in 1923.

Banking. The number of banks in the Territory increased from 19 in 1914 to 29 in 1923, while the commercial deposits increased from \$10,371,874 in 1914 to \$31,610,007 in 1923. Deposits in the savings banks increased from \$6,275,790 in 1914 to \$21,755,731 in 1923. There were, in 1923, two national banks, a decrease from the five of 1914. One of these was at Honolulu and the other at Scofield.

Health and Sanitation. Nearly all the public health work in the Territory was done by the Territorial Department of Public Health, and during the decade 1913-23 much satisfactory work was accomplished. The death rate per thousand in population decreased from 15.03 in 1914 to 12.54 in 1923. Campaigns for the eradication of rats and mosquitoes were carried on during this period. For many years plague had been endemic in the Hamaqua district and the island of Hawaii, and the object of these campaigns was the destruction of rats which acted as carriers of the germs of the plague. In 1923, nearly 200,000 rats were destroyed. Several cases of plague occurred each year. Material progress was made in the decade in the campaign against tuberculosis. Education and publicity work was carried on in the public press and lectures and sanatoria were maintained for persons suffering from this disease. The Hawaiian race is especially susceptible to tuberculosis. Nearly one out of every 100 persons of this race have the disease or traces of it. Institutions were maintained on the island of Molokai and other localities in the islands for the treatment of leprosy. The number of persons suffering from this disease decreased from 638 in 1914 to 323 in 1923. The installa-

tion of sewage systems in Hawaii and other localities resulted in a great improvement in the sanitary conditions. The United States Public Health Service performed valuable services in the decade, having general charge of the examination of vessels entering the ports. It also aided the Territorial Board of Health in its rat campaigns and other functions of that department.

History. There was little of political interest of importance in the history of Hawaii in the decade 1914-24. During the entire period there was steady development in economic and other directions. A direct primary law, somewhat similar to the Berkeley system of double elections, was adopted by the Legislature of 1913 and elections were held under this law in 1915 and in the odd years thereafter. Sessions of the Legislature are also held biennially. The Legislature of 1915 passed much legislation of an advanced character. The laws relating to taxation were amended and ample provision was made for the encouragement of immigration in the Territory. In 1916, the government created the Hawaii National Park, which was the first national park lying outside the continent of the United States. In this park were included the three volcanoes, Kilauea, Mauna Loa, and Haleakala. With the entrance of the United States into the War, Hawaii took on added importance as a naval station, and it became the largest military outpost of the United States. The National Guard was brought in numbers and plan of organization to the maximum that could be obtained under voluntary service. Four regiments and other units were organized. This organization policed the islands, thus relieving the regular army of this duty. At the outbreak of the War, there were eight German merchant vessels and gunboats interned in the port of Honolulu and several merchantmen in the port of Hilo. These were seized by the United States government and placed at once in commission. The Legislature in 1917 created a commission to conserve and regulate the food supply, revised banking laws, and made provision for the citizens absent in the army and navy. On July 1, 1918, the first and second regiments of Hawaiian infantry were drafted into the national service. Owing to the greatest storm in the history of the Territory, a special session of the Legislature was held in this year and appropriations made to rebuild bridges and other public works destroyed by the storm. On Aug. 21, 1919, the Secretary of the Navy opened the new concrete drydock at Pearl Harbor on the island of Oahu. There was a serious strike on the sugar plantations in February, 1920, which lasted until June, when the laborers decided to return to work on the conditions that prevailed before the strike. At the legislative session of 1921 an act was passed raising the limit of outstanding bonded indebtedness to \$16,500,000. A court of domestic relations was created and hours of child labor were regulated. A measure was passed also creating an emergency labor commission. The Legislature of 1923 authorized the preparation of a statement defining and emphasizing the status of the Territory, which was entitled "Hawaii's Bill of Rights." This statement was designed to emphasize the unique position held by Hawaii among the Territorial possessions, in that it had always been a source of Federal revenue

while it had been uniformly deprived of the benefits of the Federal appropriations. The Legislature of 1923 amended the election laws, revised the Territorial tax law, increased the bonded indebtedness, amended the workmen's compensation act, and passed a uniform law on aeronautics. Conferences of Pacific leaders organized by the Pan-Pacific Union and held at Honolulu met in various years during the decade. A conference of scientists was held in 1920, a conference of educators in 1921, a conference of journalists in the same year, and a conference of commerce and finance in November, 1922. In addition, a conference on education was held in connection with the World Conference on Education which met in San Francisco in July, 1923.

HAWK, PHILIP BOVIER (1874-). An American physiological chemist, born at East Branch, N. Y. He was graduated in 1898 at Wesleyan and studied at Yale and Columbia Universities, taking his Ph.D. at the latter in 1903. During 1901-03 he was assistant in physiological chemistry at Columbia and then went as demonstrator of that subject to the University of Pennsylvania. He held a similar professorship at Illinois in 1907-12 and later accepted the chair of physiological chemistry and toxicology at Jefferson Medical College in Philadelphia. Dr. Hawk made a specialty of such subjects as metabolism, animal acids, food and nutrition, and the drinking of water, on all of which he has published papers. He was a member of the International Congress of Alimentary Hygiene held in Brussels in 1910 and of the Ninth Congress of Applied Chemistry held in New York in 1912. During the war with Spain he served on coast defenses with the Connecticut volunteers. Besides editing the *Journal of Metabolic Research*, he was an associate editor of *Chemical Abstracts*. He is the author of a series of articles on food in *The Ladies Home Journal*; of *Practical Physiological Chemistry* (1907), and of *What We Eat and What Happens to It* (1919).

HAWKES, HERBERT EDWIN (1872-). An American educator, born at Templeton, Mass. He graduated from Yale University in 1896 and was instructor of mathematics in that university in 1898. After postgraduate studies in Germany, he was appointed assistant professor of mathematics at Yale in 1903, serving until 1910, when he became professor of mathematics in Columbia University. In 1917-18, he was acting dean of Columbia College and from 1918, dean. He is the author of *Advanced Algebra* (1905), and *Higher Algebra* (1913), and the coauthor of several other books on mathematics. He has conducted important researches in hyper-complex numbers.

HAWKINS, ANTHONY HOPE (1863-). An English novelist known as "Anthony Hope" (see Vol. XI). He published: *A Young Man's Year* (1915); *Captain Dieppe* (1918); *Beaumaroy Home from the Wars* (1919); *Lucinda* (1920).

HAWLEY, RALPH CHIPMAN (1880-). An American forester, born at Atlanta, Ga. He graduated from Amherst College in 1901 and from the Yale School of Forestry in 1904. After serving with the United States Forest Service, he was assistant State forester of Massachusetts in 1906-07. From the latter date, he was professor of forestry at the Yale School of Forestry. Professor Hawley is the

author of *Forestry in New England* (1912), *A Manual of Forestry* (1918), and *The Practice of Silviculture* (1921).

HAWORTH, PAUL LELAND (1876-). An American author, born at West Newton, Ind. He graduated from Indiana University in 1899 and took postgraduate courses in history at Columbia University. He was a member of the faculty of several schools and colleges, including the Michigan Northern State Normal School, Columbia University and Bryn Mawr College, from 1906 to 1911. In 1916, he made explorations in the Canadian Rockies and revisited the same region in 1919, discovering new lakes and mountains. In 1918-19, he was acting professor of history at Indiana University and was a member of the Indiana House of Representatives in 1920-21. He was the author of: *The Path of Glory* (1911); *America in Ferment* (1915); *George Washington, Farmer* (1915); *The United States in Our Own Times, 1865-1920*; (revised, 1924); *Trail Makers in the Northwest* (1921).

HAWTHORNE, CHARLES WEBSTER (1872-). An American painter (see VOL. XI). Among his awards during the period were the Altman prize, National Academy of Design, 1915; the Temple medal, 1915, and the Lippincott prize, 1923, Pennsylvania Academy of Fine Arts. In his later paintings, among them, "Fisherman and Daughter," and "Adoration," there was still a spirit reminiscent of the Italian primitives.

HAY, WILLIAM HENRY (1860-). An American army officer, born in Jefferson County, Fla. He was graduated from the United States Military Academy in 1886, entered the United States Army as second lieutenant of the Third Cavalry, and continued in the service until his retirement in 1923, in which year he was also made a major-general. As colonel, he commanded the 15th Cavalry in the Philippines in 1917 and in the recent War he had the 28th Division, participating in the campaigns of the St. Die sector, the Vosges, the Pont à Mousson sector, the Thiancourt sector, the Meuse-Argonne offensive, and the offensive of the 2d Army Corps. Later he served in the Inspector-General's office (1920) and then with the General Staff (1921). For his services he received the United States Distinguished Service Medal, the Croix de Guerre with two palms, and the French decorations of the Legion of Honor and the Black Star.

HAYAKAWA, SESSUE KINTARO (1889-). A Japanese actor and playwright, born in Tokyo. He studied at the University of Chicago and starred in moving-pictures with various companies, including his own. Among his productions, of which he is also author, are *His Birth-right*; *Hearts in Pawn*, and *Even unto Eternity*.

HAYES, CARLTON JOSEPH HUNTLEY (1882-). An American educator and historian, born at Afton, N. Y. He graduated from Columbia University in 1904, and after postgraduate courses at that university became lecturer in history in 1907, assistant professor in 1910, associate professor in 1915, and full professor in 1919. In the War he served as captain of the United States Military Intelligence Division of the General Staff in 1918-19. He is a member of many historical and other learned societies and is the author of *Sources Relating to Germanic Invasions* (1909); *British Social Politics* (1913); *Political and*

Social History of Modern Europe (1916); *Brief History of the Great War* (1920). He is also coauthor of *The League of Nations, Principle and Practice* (1919).

HAYES, DOREMUS ALMY (1863-). An American theologian (see VOL. XI). He published *Paul and His Epistles* (1915); *John and His Writings* (1917); *The Synoptic Gospels and the Book of Acts* (1919); *Great Characters of the New Testament* (1920); *New Testament Epistles* (1921).

HAYES, PATRICK JOSEPH (1867-). An American Cardinal, born in New York, and educated at Manhattan College, New York City, and the Catholic University of America. He was ordained priest in 1892, was president of Cathedral College from 1903 to 1914, and became rector of St. Stephen's Church in 1915. He was made Archbishop of New York in 1919. During the War he was appointed Catholic chaplain bishop for the United States Army and Navy. In 1924, he was nominated as Cardinal, and went to Rome to be formally inducted into the office.

HAYES, SAMUEL PERKINS (1874-). An American psychologist, born at Baldwinsville, N. Y. Educated at Amherst College, Union Theological Seminary, Columbia and Cornell Universities, he became professor of psychology at Mount Holyoke in 1906. He was also director of psychological research of the Pennsylvania Institution for the Blind, the Perkins Institution and the Massachusetts School for the Blind. He specialized in the psychology of the blind and published an important monograph on the *Mental Measurement of the Blind* (1915).

HAY FEVER. This affection tends to merge itself in the larger group of foreign protein sensitizations, and to range itself more and more with the asthmas and food intoxications. The former plan of inoculation in the spring with mixed pollens seems to be giving way more and more to a policy of identifying the specific exciter of the disease and immunizing against it. Within the decade 1914-24 Dr. Schleppegrell of New Orleans did much service in describing all plants that can set up hay fever and in giving them something of a rating as to their individual importance. In 1922, Dr. Vaughan of Richmond published the result of his experiments in isolating the offending plant in the individual case. Only when immunization with mixed pollens has failed will it become necessary to take these pains. In intractable cases, this author found that the patients were especially sensitive to the short ragweed pollen, although this does not mean that the individual is insensitive to all others. However, the patients in question recovered under injections of the pollen of this plant although, instead of the usual weekly injection, he employed daily injection, and it therefore is suggested that the latter plan be adopted in the obstinate case. In regard to the possibility that the patient in such cases has benefited by previous treatment, the author states that untreated subjects furnished the same result. In order to determine sensitivity to individual pollens, the skin reaction is employed. The author usually preferred to make successive routine tests with short ragweed, giant ragweed, timothy, daisy, sunflower, corn, orchard grass, goldenrod, etc., although with most of these plants reaction will be neg-

ative. This is evidently preferable to attempts at selection.

HAYS, WILLIAM CHARLES (1883-). An American architect, born in Philadelphia, Pa. He graduated from the University of Pennsylvania and studied in Paris, beginning the practice of his profession in 1895. In 1904, he removed to California. He became assistant professor of architecture at the University of California in 1906 and in 1917 was made acting director. He was consulting architect of that university and designed many of its buildings.

HAYS, WILLIAM HARRISON (1879-). An American lawyer, born at Sullivan, Ind. He was graduated at Wabash College in 1900, later studying law. In 1904, he was chosen a member of the Republican State Advisory Committee of Indiana and in 1910 he was elected city attorney of Sullivan, Ind. He became chairman of the Republican Central Committee of Indiana in 1910 and in 1918 was chosen chairman of the Republican National Committee, continuing in that office until 1921, when President Harding appointed him to his cabinet, as postmaster-general. This place he held for one year and then resigned to become president of the Motion Picture Producers and Distributors of America. During the War he was chairman of the Indiana State Council of Defense. He is a member of the Indiana State Bar Association and of the honor legal fraternity Phi Delta Theta, of which he was State president for Indiana and in 1920 was elected national president.

HAYWARD, WILLIAM (1877-). An American lawyer, born at Nebraska City, Neb. He was educated in Munich, Germany, and studied law at the University of Nebraska, beginning practice in Nebraska City in 1897. During the Spanish-American War he served as colonel of the 2d Infantry of Nebraska. He removed to New York in 1911 and became a member of the law firm of Wing and Russell. He was assistant district attorney for 1913-14, and was appointed member of the Public Service Commission in 1915. He resigned to improve and organize the 15th Infantry (colored) which later became the 369th United States Infantry. He commanded this organization in France and with it participated in many battles. He was awarded the Croix de Guerre, also decorations from the United States and foreign governments. In 1921, he was appointed United States Attorney for the Southern District of New York.

HAYWOOD, WILLIAM D. (?-). An American labor agitator (see VOL. XI). He became conspicuous early in 1917, when, as secretary of the Industrial Workers of the World (q.v.) with headquarters in Chicago, he was arrested on a charge of seditious conspiracy. He was sentenced to 20 years' imprisonment and to pay a fine of \$10,000, but was released on bail, and, in April, 1921, fled to Russia. In March, 1922, he headed a group of American members of his organization who were granted a concession to operate the Nadejdinsky Iron Works in Russia, and in August of the same year it was reported that some of these American I. W. W.'s had mutinied and were without sufficient food and shelter. Some went to deserted coal mines in the Kuznetsk Basin, Siberia, while others started for the iron mines in the Urals.

HAZARD, CAROLINE (1856-). An American educator (see VOL. XI). During the War she was prominent in the work of the

Woman's Council of National Defense (1916), the first Liberty Loan (1916), the War Savings Campaign (1917), and the United War Work Campaign (1918).

HAZEN, CHARLES DOWNER (1868-). An American historian (see VOL. XI). He was professor of history at Columbia University after 1916. His later works include: *Modern European History* (1917); *The French Revolution and Napoleon* (1917); *Alsace-Lorraine Under German Rule* (1917); *The Government of Germany* (1917); *Fifty Years of Europe* (1919); *Modern Europe* (1920). He also edited *Historical Essays by Lord Macaulay* (1921), and *The Kaiser vs. Bismarck* (1921).

HAZEN, SIR JOHN DOUGLAS (1860-). A Canadian lawyer and statesman (see VOL. XI). He represented Canada at the Imperial War Cabinet in 1917, and in 1917-19 was chairman of the Canadian Section of the International Fisheries Commission. He also became Chief Justice of New Brunswick in 1917, and in the following year was knighted.

HEADLAM, ARTHUR CAYLEY (1862-). An English theologian (see VOL. XI). His later works include: *The Miracles of the New Testament* (1914); *The Revenues of the Church of England* (1917); *The Study of Theology* (inaugural lecture, 1918); *The Doctrine of the Church and Christian Reunion* (Bampton Lectures, 1920).

HEALY, TIMOTHY (1855-). Irish Nationalist leader (see VOL. XI). In 1917, he published *The Great Fraud of Ulster*. On Dec. 4, 1922, he accepted from the British government the post of Governor-General of the Irish Free State, and two days later the new Irish orange, white and green flag took the place of the Union Jack over the public buildings in Dublin. He refused all the unnecessary honors to which his office of governor-general entitled him.

HEARING. See PSYCHOLOGY, EXPERIMENTAL; ADDITION.

HEARST, WILLIAM RANDOLPH (1863-). An American newspaper publisher (see VOL. XI). Although he took no active part as a candidate in politics in the decade 1914-24, he continued to exercise influence through his ever-increasing list of newspapers. After the purchase of the San Antonio Light in May, 1924, he had 24 papers in all parts of the country. He also was the owner of many magazines of wide circulation, including *Good Housekeeping*, *Cosmopolitan*, and *Hearst's International Magazine*.

HEART DISEASE. The enormous death rate and the increasing incidence of chronic heart disease strike the eye of the reader of mortality records and excite wonder as to the final outcome. This mode of decease is doubtless a result in part of the greater average duration of life, a greater proportion of citizens reaching the age at which degenerative diseases of the vital organs naturally occur. The exact causal factors cannot be visualized and it is customary to set these affections down as due to civilization, since the savage and primitive man show no such predisposition. Organic heart disease, hardening of the arteries and one form of chronic disease of the kidneys are so closely associated that they may be visualized as a single disease group, although not necessarily due to a single cause; for implication of one organ can readily bring about diseases in the others. Disease of the arteries leads to involvement of the heart,

as does also disease of the kidneys. Some idea of the prevalence of these affections may be obtained by a glance at one of the *Weekly Bulletins* of the New York City Health Department. Thus for the week ending Apr. 3, 1924, the total number of deaths lacked but one of 1700, and of this number 500, in round numbers, died of disease of the heart, arteries and kidneys.

Within the decade 1914-24, two casual factors received increasing emphasis. These were syphilis and so-called focal infection or medical sepsis, as it is sometimes called. Other factors vaguely evident may be summed up under defective personal hygiene, which includes improper eating and drinking, the stress of modern living, and in general the drawbacks of civilized existence. Since 1918, cardiac therapeutics seems to have been greatly enriched by the introduction of the drug quinidin, which already vies with digitalis in making it possible for a man to live and labor with advanced heart disease. Quinidin is even superior in some ways to the older remedy because it seems equal to an actual cure of cases of permanent loss of rhythm, indicating deep-seated disease. See ADRENALIN.

HEBER, CARL AUGUSTUS (1874-). A sculptor who was born in Stuttgart, Germany. He studied with Taft, in Chicago, and became a member of the National Sculpture Society in 1904. He was also a member of the New York Architectural League and well known for his designing of memorials. His work includes the "Champlain Memorial" at Crown Point, N. Y., the "Champlain Statue" at Plattsburg, N. Y., the "Schiller Monument" at Rochester, N. Y., the "Benjamin Franklin" at Princeton University and "Pastoral" exhibited at the Art Institute in Chicago. Among his awards were a bronze medal from the St. Louis Exposition in 1904 and a bronze medal from the Panama-Pacific International Exposition in 1915.

HECHT, BEN (1893-). An American author, born in New York City. He was educated in Racine, Wis., and began his journalistic career with the *Chicago Journal* in 1910. He joined the staff of the *Daily News* in 1914. From December, 1918, to December, 1919, he was correspondent in charge of the Berlin Office of News. He is the author of *Erik Dorn* (1921); *Gargoyles* (1922); *Fantazius Mallare* (1922); *The Egoistic* (drama); *The Florentine Dagger*; *1001 Afternoons* (1923); and short stories in the magazines.

HEDIN, SVEN ANDERS (1865-). A Swedish explorer and author (see Vol. XI). His works have been translated into many languages. After 1914 he published: *Andra varnunger* (1914); *Fyra tal* (1914); *Ett ord till Norges folk* (1914); *Tal till ungdomskräter, borgare och bonder* (1914); *Fran fronten i vaster* (1915); *Kriget mot Russland* (1915); *Till Jerusalem* (1917); *Bagdad, Babylon, Niniveh* (1917); *En levnads teckning* (1920); *Resare Bengt* (1921); and other works.

HEDJAZ. See ARABIA.

HEDRICK, EARLE RAYMOND (1876-). An American mathematician, born at Union City, Ind. He was graduated at the University of Michigan in 1896, then held fellowships at Harvard, and finally took his Ph.D. at Göttingen in 1901. During 1901-03 he was instructor of mathematics at the Sheffield Scientific School at Yale University, but in the latter year became professor of mathematics at the University of Missouri. During the War he served on the Di-

vision of Physical Sciences of the National Research Council. He became editor-in-chief in 1921 of the *Journal of the American Mathematical Association*, of which organization he was president in 1916. Dr. Hedrick edited *A Series of Mathematical Texts* and (with D. C. Jackson) the *Engineering Science Series*. He wrote *A Course in Mathematical Analysis* (1904); *An Algebra for Secondary Schools* (1908); and *Application of the Calculus to Mechanics* (1909).

HEGELE, WILHELM (1870-). A German novelist. He was born at Varel and studied at the universities of Berlin, Munich, Vienna and Geneva. He is the author of: *Sonnige Tage* (1898); *Nellys Millionen* (1899); *Pastor Klinghammer* (1903); *Flammen* (1905); *Ingenieur Horstmann* (1906); *Das Iergerniss* (1907); *Die Leidenschaft des Hofrat Horn* (1914); *Die goldene Kette* (1915); *Zwei Freunde* (1921), and other works. He also wrote a monograph on *Heinrich von Kleist*.

HEGNER, ROBERT WILLIAM (1880-). An American zoologist born at Decorah, Iowa. He was educated at the University of Chicago and at the University of Wisconsin (Ph.D., 1908). He was assistant at the University of Chicago (1905-07), professor of biology, State Normal School, River Falls, Wis. (1907), assistant in zoology at the University of Wisconsin (1907-08) and instructor at the University of Michigan (1908-10). In 1910, he went to Johns Hopkins University, where he was successively assistant professor (1910-18), associate (1918-19), and associate professor in charge of department of medical zoology (1920-). He published: *College Text Book of Zoology* (1912); *Introduction to Zoology* (1910); *The Germ Cell Cycle in Animals* (1914); and numerous papers in journals.

HEIBERG, GUNNAR EDVARD RODE (1857-). A Norwegian dramatist and writer on drama (see Vol. XI). He published *Set og hort* (1917), *Ibsen og Bjornson paa scenen* (1918), *Franske visitter* (1919), and *Norsk teater* (1920).

HEIDENSTAM (KARL GUSTAF) WERNER VON (1859-). A Swedish poet and littérateur (see Vol. XI), who in 1916 received the Nobel prize. His recent works include *Om Svenskarnas lynne* (1914), *Vad vilja vi?* (1914), and a volume of verse, *Nya dikter* (1914).

HEIFETZ, JASCHA (1890-). A Russian violinist, born at Vilna. His is one of the most remarkable cases of precocity on record, for at the age of three he began to receive regular instruction on the violin from his father. After a little more than a year he was admitted to the Imperial Music School at Vilna. At the age of six he played Mendelssohn's concerto in public at Kovno, scoring a sensational success. Nevertheless, he continued his studies at the Music School until 1907, when he became a pupil of Auer at the Petrograd Conservatory. Even before he graduated, he made frequent public appearances which spread his fame through Russia. His international fame dates from the phenomenal success of his Berlin début (1912), which he repeated the next year in Vienna, and the following year in all the principal cities of Germany. After an equally successful tour of Scandinavia, he made his American début in New York (Oct. 27, 1917). His American tours were an uninterrupted series of triumphs. In 1921, he made a tour of Australia. Even before he was out of his teens he was universally

recognized as the equal of the greatest living violinists. Auer is said to regard him as his greatest pupil.

HEIJERMANS, HERMAN (1864-). A Dutch dramatist and novelist. Among his recent works are *Robert Bertram et Cie.* (1914), *Eva Bonheur* (1919), *Feest*, in the English translation *Jubilee* (1923), and *Saltinbank*, also in English (1923).

HEINZE, RICHARD (1867-). A German scholar and rector of the University of Leipzig (1921-22). He was born at Naumburg and studied at Bonn, Leipzig and Berlin. He was lecturer at the University of Strasbourg (1893-99), then professor at the universities of Berlin, Königsberg and Leipzig. He is the author of: *De Horatio Bonis Imitatore* (1889); *Xenokrates* (1893); an interpretation of the third book of *Lucretius* (1897); *Virgils epische Technik* (1915), *Ciceros politische Anfänge* (1909); *Tertullii Apologeticum* (1911); *Die lyrischen Werke des Horaz* (1919); *Ovids elegante Erzählungen* (1920).

HELFERRICH, KARL (1872-1924). A German economist and politician. He was born at Neustadt, and was educated at the universities of Munich, Berlin and Strasbourg. He taught at the University of Berlin and later at the government school for colonial politics and oriental languages. In 1902, he entered upon a diplomatic career. He soon became a leader in the German government's policy of economic imperialism, and in 1906 he was appointed director of the Anatolian Railway. In 1908, he was made director of the powerful Deutsche Bank in Berlin. At the close of the Balkan War he was the German financial delegate to the international conference (1913). He was Minister of Finance from 1915 to 1917, and was said to be responsible for the policy of financing the War through loans instead of taxes. After the Treaty of Brest-Litovsk, he was sent to Moscow as the German Ambassador to Russia, succeeding Von Mirbach, who was assassinated. Elected to the Reichstag of 1920, Helferrich threw in his influence with the extreme nationalists and would have nothing to do with the economic fulfillment of the Versailles Treaty. He was killed in a railway wreck on Apr. 23, 1924. His works comprise chiefly economic and political studies. A partial list follows: *Die Reform des deutschen Geldwesens nach der Grundung des Reiches* (1898); *Handelspolitik* (1901), *Geld und Bank* (1903), *Die Weltkrieg* (1919).

HELICOPTER. See AERONAUTICS.

HELIOTROPISM. See ZOOLOGY, *Tropisms*.

HELIUM. See AERONAUTICS; CHEMISTRY, ORGANIC; CHEMISTRY, PHYSICS.

HELLER, EDMUND (1875-). An American naturalist, born at Freeport, Ill. He graduated from Leland Stanford, Jr., University in 1901. From that year to 1907, he was naturalist for the Field Museum in Chicago and was engaged in explorations in California, Mexico, Guatemala and East Africa. In 1907-08, he was curator of mammals at the University of California Museum of Natural History, and in 1909-10, naturalist for the Smithsonian African Expedition in East Africa under the direction of Theodore Roosevelt. He was a member of expeditions in Africa, Peru and China (1909-17). During the War he served on the photographic staff of the Czecho-Slovak Army, and in 1919-20 was a member of the Expedition of the Smithsonian Institution in Africa. He was a member

of many societies and was the joint author (with Theodore Roosevelt) of *Life Histories of African Game Animals*. He wrote, also, numerous papers on fishes, reptiles and birds.

HELLMAN, GEORGE SIDNEY (1878-). An American author, born in New York City, and educated at Columbia University. In 1918-19 he served as director of the Department of Fine and Applied Arts for the Army Educational Commission of the Y. M. C. A. and in 1919 was director of instruction in Fine and Applied Arts of the American Expeditionary Forces. He was director of the American Expeditionary Forces Art Training Centre at the Bellevue in Paris. He served on several commissions relating to war memorials and in 1920 was treasurer and director of the Hugo Ballin Productions. His writings include *The Hudson and Other Poems* (1909); *Applied Arts and Education* (1919); *Art and the Citizen* (1919), and *The Way It Ended* (1920). He also edited the works of other authors and contributed poems and stories to magazines.

HELMICK, ELI ALVA (1863-). An American military officer, born at Quaker Point, Ind. He was graduated at the United States Military Academy in 1888. He was promoted to second lieutenant in the 11th Infantry and continued in the army until Nov. 7, 1921, when he was made Inspector-General with the rank of major-general. His services have included duty in Idaho during the Cœur d'Alene riots (1892), participation in the expedition to Santiago de Cuba (1898), campaign against the Moros (1902), duty on the Mexican border (1910 and 1916), and service in the Inspector-General's office (1916-18). During the War he commanded the 8th Division with the provisional rank of major-general, and later was in command of the service of supplies at Brest. The United States Distinguished Service Medal was conferred on him.

HEMING, ARTHUR (1870-). An illustrator and writer, born in Canada at Paris, Ont., who came to the United States as a student and was a pupil of Frank Brangwyn and Frank V. DuMond. He is a member of the Society of Illustrators and of the Arts and Letters Club of Toronto. Mr. Heming knows his natural scenery and puts it on canvas with a peculiar gift. Among the books which he has written and illustrated are *Spirit Lake* and *The Drama of the Forests*. In the Royal Ontario Museum there are 10 of his pictures on exhibition and he is also represented in the Canadian National Gallery.

HENCKELL, KARL FRIEDRICH (1864-). A German poet (see VOL. XI) identified with the Young Germany of the '80s. After 1914, he published the following works: *Lyrik und Kultur* (1914); *Weltmusik* (1918); *Gedichte* (1921); *Buch des Kampfes* (1921); *Buch der Saat* (1923); *An die neue Jugend* (1924).

HENDERSON, ARCHIBALD (1877-). An American mathematician and author (see VOL. XI). His later books include *O. Henry* (1914); *Star of the Empire* (1919); *Conquest of the Old Southwest* (1920).

HENDERSON, ARTHUR (1863-). A British public official, born in Glasgow. He worked for several years in a foundry. Becoming interested in the labor movement, he speedily became a leading figure in trade unionism and held numerous official positions in connection with that movement. For several years he was

a member of the Newcastle City Council. He was elected to Parliament in 1903 and was successively reelected until 1918. From 1908 to 1910 he was secretary of the Labor party, and again from 1914 to 1917. In 1914 he was chief whip of that party and became its chairman at the outbreak of the War. Joining the first coalition cabinet as president of the Board of Education, he served in 1915-16 and in the latter year was paymaster general and labor advisor to the government. He joined the second coalition cabinet as a member without portfolio. In May, 1917, he went on a government mission to Russia and in August of that year resigned from the cabinet. He was defeated for Parliament in the general election of 1918 but was elected in the following year. In the election of 1922 he was elected by the Labor party and became one of its prominent leaders in Parliament. In the general election of 1923 he was defeated but was afterward elected and became a member of the Labor cabinet.

HENDERSON, LAWRENCE JOSEPH (1878-). An American biological chemist born at Lynn, Mass. He was educated at Harvard (M.D., 1902) and at the University of Strasbourg. He was lecturer in biological chemistry (1902-03), instructor (1903-10), assistant professor (1910-19), and professor (1919-) at Harvard. Professor Henderson published *Fitness of the Environment* (1913), *The Order of Nature* (1917), and numerous papers dealing with applications of physical chemistry to biology.

HENDRICK, BURTON JESSE (1871-). An American writer, born in New Haven, Conn., and educated at Yale. For several years he was on the staff of newspapers in New Haven and New York. He became associate editor of *The World's Work* in 1913. He has written *The Age of Big Business and Life and Letters of Walter Hines Page* and was coauthor, with Admiral W S Sims, of *The Victory At Sea*. This book won the Pulitzer Prize for the best book published in 1920 on the history of the United States. He was a frequent contributor to magazines.

HENDRICK, ELLWOOD (1861-). An American chemist, born at Albany, N. Y. He studied chemistry at Zurich under Victor Meyer, and on his return to the United States was superintendent of the Albany Aniline and Chemical Works (1881-84), then, turning his attention to insurance and stock brokerage, continued in that business until 1915, when he retired. In 1917, he became a member of the staff of the research corporation of Arthur D. Little and Company of Cambridge, Mass. Besides being consulting editor of *Chemical and Metallurgical Engineering*, he is the author of many articles on science in popular magazines and published *Everyman's Chemistry* (1917), *Opportunities in Chemistry* (1919), and *Percolator Papers* (1919).

HENEY, FRANCIS JOSEPH (1859-). An American lawyer (see Vol. XI). In 1917-18, he served as special attorney for the Federal Trade Commission in charge of investigation of the high cost of living, with special reference to the packing industry. In 1918, he was Democratic candidate for Governor of California.

HENNING, H. See **PSYCHOLOGY, EXPERIMENTAL**.

HENRI, ROBERT (1865-). An American painter and portraitist (see Vol. XI). With the same sincerity of purpose and simplic-

ity of method which he had in former years devoted to unsophisticated European types, he turned in 1914 toward the people of California and the Southwest, continuing to look at each individual "with the eager hope of finding there something of the dignity of life, the humor, the humanity, the kindness, something of the order . . . of the universe." Among these later works were "Tam Gan," "Ramon—a Mexican," "Jim Lee," and "A Girl of the Southwest." He was awarded the portrait prize, Wilmington Society of Fine Arts, 1920. His influence as a teacher, pre-eminently as a personality, continued to be of much importance. *The Art Spirit* (1923) is a compilation by Margery Ryerson of fragments of his letters and of his talks to students on the spirit, technique, and appreciation of picture-making.

HENRY, PRINCE OF PRUSSIA (HEINRICH ALBERT WILHELM) (1862-). A German admiral and brother of the ex-Kaiser of Germany (see Vol. XI). He was commander-in-chief of the Baltic fleet from 1914 to 1918.

HENRY, ROBERT L, JR. (1882-). An American professor of law, born at Chicago, educated at the University of Chicago, and as Rhodes scholar at Oxford, England; also at Heidelberg, Germany, and Grenoble, France. He held the position of professor of law at several State universities, also holding the post of dean of the College of Law at the University of North Dakota from 1912 to 1914. He was commissioned captain of infantry in the Officers' Reserve Corps in 1916, and promoted to major in 1919. He was instructor in several officers' training camps from 1917 to 1919, and was a member of the War Department Board of Contract Adjustment in Washington during 1919-20. He lectured at Oxford, England, during 1920-22. His writings include: *Liens and Pledges* (1913); *Consideration in Contracts 601 A.D. to 1520 A.D.* (1917); *Anglo-Saxon Contracts* (1917).

HENSON, HERBERT HENSLEY (1863-). An English clergyman and author (see Vol. XI). He was appointed Bishop of Durham in 1920. His later publications include: *War-Time Sermons* (1915); *Robertson of Brighton, 1816-1853* (1916); *Christian Liberty* (1918). He edited *The Naked Truth*, by Bishop Croft (1919); *Sir William Anson: a Memoir* (1920); *Anglicanism* (1921).

HEPBURN, A(LONZO) BARTON (1846-1922). An American banker, philanthropist and author (see Vol. XI). He was a member of the Federal Advisory Council of the Federal Reserve Board in 1918, and was a prominent member or officer of important associations concerned with economics and political science. In 1915, he wrote *A History of Currency in the United States*. He died in New York City.

HERBERT, VICTOR (1859-1924). An Irish-American conductor and composer (see Vol. XI). Among the numerous productions of his last decade the following achieved conspicuous success: *Princess Pat* (1915), *Eileen* (1917), *Angel Face* (1919), *Orange Blossoms* (1921), *The Dream Girl* (1924). In the field of light opera Herbert not only towers far above all his American colleagues because of his inexhaustible melodious invention, splendid orchestration and solid technical attainments, but has securely established his place by the side of such masters as Johann Strauss, Offenbach, Millöcker, Suppé and Sullivan.

HEREDITY. An observational and experimental study of the laws governing the transmission of physical or mental characteristics through successive generations of animals, or of physical characteristics in plants, the laws being in general the same in the two great groups of living beings. A complete theory of heredity must offer an explanation of two sets of phenomena—first, the fact that, on the whole, offspring resemble their parents more than they resemble other members of the race; and second, that this resemblance is never absolute but the offspring always show some differences from the parents, i.e. they show variability.

An important date in the history of this subject is 1809, when Lamarck formulated his theory of the effects of use and disuse of organs and of the effect of environment on the structure of plants and animals. According to Lamarck, the increased size of an organ through use or its decreased size following disuse was passed on to the offspring so that in the course of generations descendants of the original animals, through accumulation of these structural changes, would be quite unlike their ancestors. Similarly, plant structures would be modified in response to climatic conditions, or to changes in the environment such as moisture or chemical composition of the soil, so as to lead in the end to considerable structural modifications.

Lamarck was arguing in favor of the evolution of species and developed this theory as an explanation of this evolution, but running as it did, contrary to the generally held belief in the fixity of species, the theory met with nothing but opposition, and it was only after 1859, when Darwin's formulation of a theory of evolution was widely accepted, that it received recognition. In the evolutionary writings from 1859 to 1890, there was general acceptance of the doctrine of use-inheritance. This was, indeed, carried to much greater extremes than it was by Lamarck himself, in that there was a general belief that scars resulting from injuries, or the effects of mutilations such as the loss of an organ through accident, would appear as a birthmark in the offspring. Thus the child of a German student had a birthmark reproducing the scar her father carried as the result of a student duel, and a cat whose tail was cut off by an accident henceforth gave birth to tailless kittens. Cases of this sort which had wide acceptance as popular legends were repeatedly cited as illustrating the method of evolution.

It was clearly recognized that the assumption of the inheritance of acquired characters carries with it the necessity of explaining the mechanism of the process. How, for example, is it possible for the removal of a cat's tail to so affect the sex cell of the cat, situated at a considerable distance from the tail, as to cause her to give birth to tailless kittens? Darwin proposed as an explanation the "provisional" theory of pangenesis, which assumed that each cell of the body is constantly throwing off gemmules or ultra-microscopic particles which collect in the sex cells. When these sex cells develop the gemmules are distributed throughout the body of the new individual, and each going to its appropriate group of cells determines the character of their development. These gemmules multiply by fission and may remain dormant for several generations. If through use or disuse or through accident, the structure of a group of cells is changed, the gemmules arising from

these cells will be correspondingly modified and when they in turn take part in the construction of a new individual that individual may exhibit the changed character. Herbert Spencer had earlier attempted to explain heredity and the inheritance of acquired characters on the assumption of "physiological units" or ultra-microscopic particles having a definite polarity which are located in the body cells and by the form of their polarity determine the appearance of the cells in which they are. Use or disuse may modify the form of this polarity and thus affect the character of the race. Neither of the above explanations has any experimental basis and both are purely formal.

Later theories are based on more exact knowledge of the actual phenomena of development, knowledge not available at the time that Darwin and Spencer were writing, and a brief summary of these phenomena will be essential here. The starting-point for each new individual in biparental inheritance is the fertilized egg, a single cell formed by the union of two cells, the *ovum* from the mother and the *spermatozoon* from the father. This fertilized egg divides into two cells, each of these divides again, and the process is repeated until eventually the many-celled adult appears. Coincident with these divisions a process of differentiation goes on, by which different portions of the complex of cells assume different structures adapted to different functions. Examination of any one of these cells under favorable conditions would show that in its central portion or nucleus is a substance called *chromatin* which just before the cell divides breaks up into rods called *chromosomes*, which are arranged in pairs and are constant in number in any one species. When the cell divides, each chromosome of a pair divides, half going to each daughter cell. Thus the number is kept constant and each cell gets a representative of each chromosome present in the cell from which it arose.

A study of the immature sex cells shows that they also have paired chromosomes but as they approach maturity, the members of each pair unite more or less closely with one another in a very complex fashion, later separate and divide with the cells containing them so that the mature sex cell contains only half the normal number of chromosomes. This process is known as *maturation*. When these cells unite in the fertilization process the number is brought back to normal and it is quite certain that one member of each pair is derived from each parent. In fertilization only the head of the *spermatozoon*, which is practically nothing but chromatin, enters the egg. Since observation shows that inheritance from the father is as strong as that from the mother, it seems evident that whatever material is the carrier of hereditary qualities must be located in the chromatin. It has also been shown in the case of a few animals that the cells which give rise to the sex organs of the new generation seem to be set aside early in the development and to be quite distinct from the other organs of the body.

In the light of this further information, Weismann attacked the problem and worked out an elaborate theory of heredity. He was the first to seriously question the validity of the Lamarckian principle, and began by investigating supposed cases of inheritance of mutilations. For these he decided there is no evidence whatever. In this connection he developed the con-

cept of the germ plasm. This may be defined as a material contained in the nucleus of the fertilized egg, whose function is to determine the character of the individual resulting from that egg. For this purpose, during development portions of the germ plasm are distributed to the appropriate regions of the developing organism, each controlling the differentiation of its own particular area. Some of this germ plasm, however, is not distributed in this fashion but remains as residual material which goes by the shortest route to the cells which are to form the sex organs of the new individual and there locates itself in the nuclei of the embryonic sex cells. Here it remains until at the time of sexual maturity the cell containing it begins to develop, unites in fertilization with the cell from the opposite sex, and the process is repeated. While in this position this residual material necessarily must receive its nutrition from the surrounding body, but Weismann supposed that it is so effectually insulated from the latter as not to be affected in any qualitative fashion by any activities of the body itself or by any influence of the environment.

If this germ plasm is thus isolated and unchangeable and determines the character of the individuals of successive generations, why are not all individuals alike? Weismann refers the origin of variations to the maturation process of the sex cells in which each cell apparently shuffles its chromatin and discards a portion of it, before fertilization takes place. Since by the law of chances this discarding is different in any two cells it follows that no two mature sex cells are exactly alike. Further variability is produced by the union of the chromatin of the two sex cells in fertilization. While much that is new has been discovered concerning the phenomena of maturation and fertilization since Weismann wrote, nothing has appeared that seriously affects this much of his theory. His further development of hypotheses concerning the structure of the germ plasm and its behavior are not of so much importance at the present time (see bibliography at end of article).

The net results of Weismann's work are two. In the first place, there is agreement among all students of heredity that mutilations or their effects are not inherited, nor is there any reason to accept the validity of reported cases of maternal impressions and prenatal influences. In the second place, there is agreement that without necessarily accepting Weismann's ideas as to the composition of the germ plasm it is necessary to assume the existence of such a substance as the determiner of hereditary qualities. The question as it now stands is this: Is it possible for this germ plasm, lying in the sex cells, to be affected by any activity of the body or by any influence of the environment so as to produce precise and permanently heritable changes in the structure of subsequent generations?

Weismann at first claimed for germ plasm a complete insulation from external influences, but later modified this position. He found that certain insects when subjected to lowered temperature became darker in color and this modification was transmitted to subsequent generations. To explain cases of this sort where animals certainly responded to external changes, Weismann developed the theory of Parallel Induction, which holds that some environmental influences are strong enough to penetrate through the body

and act directly on the germ plasm and the results of such influences may be inherited. Only those agencies that are strong enough to thus penetrate may affect the germ plasm.

The Neo-Lamarckians on the other hand, who believe in the transmission of acquired characters, hold that lesser influences, acting repeatedly on the body, may gradually penetrate it and affect the germ plasm. Admitting that the mechanisms by which such an effect could operate are not clearly to be seen, they believe that some observations can be explained only on the assumption that this has taken place. Botanists are rather more apt to take this position than are zoologists, for in the animal body are found much fewer protoplasmic connections between the organs, and the sex cells are more definitely isolated than is the case in plants. In fact, it is sometimes difficult to imagine any very complete separation in plants because of the elaborate arrangement of intercommunicating protoplasmic connections. Among zoologists the paleontologists are most apt to be Neo-Lamarckians because the history of many structures seems to show a precise parallelism between the changes that these organs show in successive ages and the changes that would have been set up in them in each generation by the uses to which they must have been put.

It is evident that an apparent case of use inheritance might be explained equally well by either of the above hypotheses, and thus a condition of deadlock results.

Most of the earlier writers on this subject devoted their time mainly to arguing on what might be considered reasonable explanations of observed phenomena, and conclusive experimental evidence is lacking. Brown-Sequard, whose results were quoted by Darwin and by later writers, thought that certain injuries to the nervous system of guinea pigs would be followed by a condition of epilepsy and this was transmitted to descendants. This for a long time stood for a valid case of the inheritance of acquired characters, but the most recent work along this line indicates that the so-called "epileptic" condition of the guinea pig appears under favorable conditions in the perfectly normal pig, and it seems certain that this case may be ruled out. Practically all of the supposed cases to demonstrate this point are either of doubtful accuracy, or are capable of two interpretations (see above) and clean-cut, precise evidence is lacking in favor of Neo-Lamarckism.

What seem at this time of writing (1924) the most promising lines of investigation are through the study of hormones and antibodies. If we inject, for example, human blood into the blood vessels of an unrelated animal, say a rabbit, the body of the rabbit will react in a definite and precise fashion, developing what is known as an antibody which has specific relations to human blood. If the blood containing the antibody is mixed with human blood a precipitate will form, but if mixed with blood from any other animal (except a few of the higher apes) no reaction occurs. A similar formation of antibodies having a specific relation to whatever material was injected would follow from the injection of any other body tissue, or on the entrance of bacteria into the blood.

Guyer and Smith injected the material from a crushed lens from the eye of a rabbit into the blood of a fowl and in that way developed an

anti-lens body in this blood. Some of this blood was injected into a pregnant rabbit at a time when the lenses of the embryos were forming, and a number of them were born with defective lenses. This defect persisted through several generations, being transmitted through the male as well as through the female and in a Mendelian fashion (see below). This would indicate that the defect was truly hereditary and not a case of infection from the mother in each generation, and leads to the conclusion that the germ plasma of the rabbit had been modified by the antibody, and since antibodies are set up in response to the entrance of foreign matter into the body it seems probable that modifications of the body might alter the character of the germ plasma.

The hormones are chemical compounds found in the blood of animals and have important functions as regulatory mechanisms. (See ZOOLOGY.) It seems possible that aside from the easily recognizable hormones others may be produced by any functioning tissue, and if this is true, it might be that the use of any organ sets free hormones which react on the germ plasma. Experiments along this line are still too few to be conclusive, but it seems probable that they indicate a procedure most likely to settle this problem which has puzzled biologists for over a century.

Biometry. An important technique for the study of heredity was developed by Galton and later by Pearson in the study of Biometry. This is an application of mathematics to the study of variation in plants and animals. First, accurate measurements are made of the structures under consideration in as large a number of related individuals as possible. These results are then plotted in the form of a curve which is available for treatment by mathematical technique. In such a curve the spread indicates the amount of variability, its mean the average measurement for the group, and its highest point or mode, the largest class within the group. The "probable error" and the "standard deviation" of such a curve are mathematical terms indicating the amount of variability from the mean, within the group. An example of the use of this method in the study of heredity would be to compare such a curve derived from measurements of one group with those obtained from a related group, e.g. parents and offspring, brothers and sisters, etc. The degree to which one group varies from the average of the race and toward the other group is taken as a measure of the strength of heredity in each case. This degree of resemblance or correlation may be expressed mathematically in the form of the "coefficient of correlation." For further details concerning the technique consult the works referred to in the bibliography.

It is obvious that this method deals exclusively with averages and not at all with individual inheritance, thus differing fundamentally from the Mendelian method described below, and there has been much disagreement as to the relative value of the two methods. Pearson and his associates consider Biometry the only method that can give accurate results, while Bateson, writing as a Mendelian, says that "To those who hereafter may study this episode (Biometry) in the history of biological science, it will appear inexplicable that work so unsound in construction should have been respectfully received by the scientific world." A reasonably conserva-

tive position would seem to be that for cases where the experimental method is possible the Mendelian is the better method, while in cases such as human heredity where experimentation is out of the question, the biometric method is the one to be employed, but that in many cases it is desirable to use both. Biometry will often detect significant differences which are not possible to demonstrate in any other way.

Mendelism. In 1866, Gregor Mendel, an Austrian monk, working on the ordinary garden pea, discovered the laws which bear his name. These results were published in an obscure journal and were overlooked by biologists until 1900, when results similar to Mendel's were independently and simultaneously discovered by de Vries in Holland, von Tschermak in Austria and Correns in Germany. Later, Bateson and Punnett in England, Davenport, Castle and Morgan in the United States, have been leaders in the further development of the subject.

Mendelism regards the individual as containing a series of hereditary determiners of *genes* which singly or in combination determine the character of the body. By means of properly devised experiments it is possible under favorable conditions to analyze the individual so as to determine the number and character of the genes responsible for the production of any character or characters and, having made this analysis, to synthesize them into new combinations in very much the same way that an organic chemist follows analysis with synthesis in the production of new chemical compounds.

In its simplest form Mendel's law may be illustrated by crossing a black and a white guinea pig. The offspring of the first generation (known technically as the first filial generation or F_1) will all be black. If these are inbred the offspring of the second filial generation (F_2) will, if the number is large enough to give smooth results, be in the proportion of three black to one white. If the whites be inbred nothing but white will ever appear among their descendants, i.e. the black has entirely disappeared from their composition. If, however, the blacks are inbred it will appear that only one-third of them will give rise to only black offspring while the other two-thirds will have both black and white descendants just as did the F_1 generation. The F_2 generation, therefore, are 25 per cent pure black, 25 per cent pure white and 50 per cent hybrid like F_1 .

Mendel's interpretation of these results was by the assumption of the "purity of the gametes," "gamete" being a generalized term meaning either of the sex cells, ovum or spermatozoon. If we assume that the sex cells of the black animal carry genes for black and those of the white ones carry genes for white, and we represent the black by B and the white by w , then in the hybrid there would be a union of the two though only one is visible. This could be represented as Bw . The theory of the purity of the gametes assumes that when this hybrid forms sex-cells, the genes segregate so that each sex cell of the hybrid (ovum in the female and spermatozoon in the male) contains one or the other of the genes but never both. The further assumption is made that in each individual the number of these two kinds of sex cells is equal. If now they unite at random in the fertilization process, the results could be expressed by the table that follows on page 615.

Of the four classes possible under such condi-

		Ova	
		<i>B</i>	<i>w</i>
Spermatozoa	<i>B</i>	<i>BB</i>	<i>Bw</i>
	<i>w</i>	<i>Bw</i>	<i>ww</i>

tions, 25 per cent of the whole contain only *B* and are pure black, 25 per cent contain only *w* and are pure white, while 50 per cent contain both black and white like the original F_1 hybrid.

This theoretical explanation agrees with observed results and the statement that in any sex cell the gene for only one of any pair of opposed characters is present is a fundamental proposition in Mendelism.

In this case where black and white guinea pigs are crossed the offspring are black. This condition is expressed by saying that black is "dominant" to white, meaning that when genes for both black and white are present in the same individual only the effects of one are visible, the white being "recessive." This relation of dominance and recessiveness is common but not universal in Mendelian heredity and by no means essential. The F_1 generation may be quite unlike either of the parents, but in all cases the segregation of the genes takes place whether there is dominance or not and both grandparental types appear in the F_2 generation.

If instead of black and white opposed characters or "allelomorphs" we take into consideration the results of crossing a short-haired guinea pig with a long-haired one, the F_1 will be short haired and results exactly similar to those described above would follow inbreeding of this generation. If instead of limiting our attention to only one pair of allelomorphs we consider simultaneously two pairs, and mate a short-haired black guinea pig with a long-haired white one, we would get in the first generation short-haired black animals. If these are inbred we get in F_2 offspring in the proportion of nine short black: three short white: three long black: one long white. Returning to the original assumption concerning the genes in the sex cells of the parents, we would assume that each sex cell of one parent contained genes for black and short and in the other parent genes for white and long. In the F_1 these would all be in the same individual, but only the effects of the dominant genes are evident. When these genes segregate in the inbreeding of the F_1 individuals, four combinations are possible, *BS*, *Bl*, *wS*, *wl*; *B* and *w* standing for black and white genes

respectively and *S* and *l* for the short and long ones. The assumption is that there are equal numbers of ova and spermatozoa carrying these genes, the four classes in each sex being equal to one another in size. The results of random union of these sex cells would be indicated by the diagram in preceding column.

The letters in each square indicate, as in the earlier diagram, the character of the individual represented in it. Remembering that *B* and *S* stand for dominant genes, it is obvious that in any square where these are both present the individual will appear to be black with short hair and there are nine such squares in the diagram.

In any square containing *S* and *w* without *B* the animal would be short haired and white and there are three such squares: in any containing *B* and *l* without *S* the animal would be black with long hair and there are three of such squares, while only one square contains neither dominant and the animal would be white with long hair. Here again, these theoretical results agree with those obtained by experiment and again the evidence is in favor of the hypothesis of the purity of the gametes.

In Mendelian terminology individuals corresponding in composition to any one of the four squares lying on the diagonal from upper left to lower right-hand corners are "homozygous" because in none of them is a recessive character hidden by a dominant and they really are what they appear to be, while in each of the other squares one or two recessive genes are present but not evident because obscured by the dominant allelomorphic gene. These individuals having this composition are called "heterozygous."

It is evident that recessive characters are visible only in cases where their genes are homozygous. Breeding from homozygous individuals gives only homozygous offspring, while among the descendants of heterozygous individuals a certain proportion will continue this heterozygous condition, some will become homozygous for the dominant characters and others homozygous for the recessive. In any one of the heterozygous squares the real character of the animal could only be determined by further breeding. Mendel in a generation of peas corresponding to the above groups analyzed them further in this way and found that they conformed in character to expectation, giving further demonstration of the truth of his "purity" hypothesis.

This work on Mendelian heredity has developed further proof that the carriers of heredity are located in the chromatin. The determination of sex seems in some way connected with the activity of a certain *X* chromosome. (See ZOOLOGY.) The distribution of this *X* chromosome from one generation to another as determined microscopically follows so closely the inheritance of certain peculiar characters as to lead to the conclusion that the gene for each of these characters is located in the *X* chromosome. If, for example, a color-blind man marries a normal woman, none of their children will be color-blind and none of the children of the sons will have this defect, but one-half of the sons of the daughters will show it. If we assume (see ZOOLOGY) that the female has two *X* chromosomes while the male has but one, and that the gene for color-blindness is located in the *X* chromosome (indicating this condition by under-

		Ova.			
		<i>BS</i>	<i>Sw</i>	<i>Bl</i>	<i>wl</i>
Spermatozoa	<i>BS</i>	<i>BS</i> <i>BS</i>	<i>Sw</i> <i>BS</i>	<i>Bl</i> <i>BS</i>	<i>wl</i> <i>BS</i>
	<i>Sw</i>	<i>BS</i> <i>Sw</i>	<i>Sw</i> <i>Sw</i>	<i>Bl</i> <i>Sw</i>	<i>wl</i> <i>Sw</i>
	<i>Bl</i>	<i>BS</i> <i>Bl</i>	<i>Sw</i> <i>Bl</i>	<i>Bl</i> <i>Bl</i>	<i>wl</i> <i>Bl</i>
	<i>wl</i>	<i>BS</i> <i>wl</i>	<i>Sw</i> <i>wl</i>	<i>Bl</i> <i>wl</i>	<i>wl</i> <i>wl</i>

scoring the X in the male; then the union of the two would be as in the diagram:

		Ova	
		X	X
Spermatozoa	X	XX	XX
	y	Xy	Xy

Squares containing two X 's would be female and if one X is normal the individual would appear normal because normal is dominant to the color-blind condition. It is evident that the color-blind gene is only in the daughters and is entirely eliminated from the sons. If one of these daughters marries a normal man the condition would be as in the next diagram.

		Ova	
		X	X
Spermatozoa	X	XX	XX
	y	Xy	Xy

The son in the lower right-hand corner would be color-blind, while the other son would not, and neither daughter shows the defect though one of them could transmit it. This theoretical result agrees perfectly with results of observation on the mode of inheritance of this disease and there is no doubt of the correctness of the interpretation. Genes which are carried in this fashion in the X chromosomes are known as "sex linked" genes and a considerable list of such genes have been identified.

Important practical suggestions arise from the study of sex linked characters. It is evident from a study of the last two diagrams that it would be possible to determine which individuals would transmit the sex linked character and which would not. If, as is true in some cases, the character is an undesirable one, it would be possible, by controlling matings, to eliminate the character from the race. On the other hand, if the sex linked character is desirable it would be possible so to control matings as to make it more common. It is evident from the diagram that, assuming absolute power to control matings, either color-blindness could be entirely eliminated or a race could be developed all of whom would be color-blind, according to which was considered the desirable condition.

Atavism or Reversion. These terms should be considered as synonymous and refer to the appearance in one generation of characters not represented in the immediate parents but present in some more remote ancestors. In the case just mentioned, color-blindness skips a generation and might even seem to skip more than one, if in the intermediate generations the individual who would otherwise show it did not happen to appear. Another familiar case is where the child of brown-eyed parents has blue eyes inherited from a blue-eyed grandparent or earlier ancestor. In eye color, the pigmented (brown or black) eye is dominant to the non-pigmented (blue or albino). If, therefore, the brown-eyed parents happen to be heterozygous for brown, having the blue as a recessive character,

one-quarter of their children would be homozygous for blue and be blue-eyed (see diagram above, referring to the guinea pig which, making the necessary changes in the symbols, would apply as well to this case). Since the number of individuals is so small in any human family, it might happen that several generations would elapse before the homozygous individual appears and thus the child seem to inherit something not possessed by its parents. This emergence of a previously hidden recessive character explains one type of atavism.

Another type has a different explanation. Bateson described a case where two white sweet peas when crossed gave a purple F_1 and this when inbred gave in F_2 nine purple to seven white. This purple color was present in the ancestral Sicilian sweet pea, so that this was an undoubted case of atavism. This can be explained on the assumption that for the production of the purple color the coöperation of two genes is necessary. If either gene is present alone no color appears; when they are both present they produce the purple color. In the history of these two varieties of sweet peas it happened that these two genes became separated and thus two lines of white-flowered plants arose, one carrying one of the genes, the other carrying the other. When they were crossed color returned. Assuming that one of these genes is represented by C with an allelomorph c and the other by R with r as allelomorph, the composition of one plant would be Cr and the other cR . When crossed this becomes $CRcr$ and color appears. Assuming that this is the case the hybrid would form gametes CR , Cr , cR , cr . Representing the result of crossing by a diagram, as before, we have:

		Ova			
		CR	Cr	cR	cr
Spermatozoa	CR	CR CR	Cr CR	cR CR	cr CR
	Cr	CR Cr	Cr Cr	cR Cr	cr Cr
	cR	CR cR	Cr cR	cR cR	cr cR
	cr	CR cr	Cr cr	cR cr	cr cr

Nine of these squares contain both C and R while none of the other seven has both of them. Accordingly nine are colored and seven white, as actual observation showed. Again theoretical expectation and observations are in agreement and demonstrate the accuracy of the theory.

Inbreeding. This is regarded, and with some experimental evidence in favor of the belief, as undesirable in that it tends to produce weakened or degenerate descendants. Many plants, however, as wheat, rice, barley, oats, tobacco, and beans are normally self-fertilizing and experiments on white rats have shown that no injurious effects follow on the closest inbreeding. It now seems certain that inbreeding in itself is not injurious, but that if there are in a race undesirable recessive traits these traits are more apt to become homozygous and thus

visible if two members of this race mate than if either mates with a more distantly related individual. If a race is free from these undesirable recessives no harmful effects follow inbreeding. On the other hand, "outbreeding" or mating of unrelated individuals is sometimes followed by an increase in vigor, apparently because it results in a combination of several desirable dominant characters.

The most elaborate experiments ever made in heredity were made by Morgan and his associates on the fruit-fly *Drosophila*, which is ideal for this purpose as it breeds rapidly and is easily kept under observation. As a result of these experiments they have not only identified a large number of genes but have demonstrated the exact location of each of these genes on the chromosome (consult bibliography).

Of much interest is the question as to the number and character of these genes. To assume that there is in the sex cell a gene for each different character of the adult would be to assume an inconceivable complexity in the germ plasm. Moreover, it is known that sometimes one gene may affect more than one body character or, on the other hand, several genes may cooperate to determine one character. It would be possible, therefore, to explain their action by the assumption of a comparatively few genes which, reacting on the original material of the fertilized egg, start the process of differentiation, then by a second reaction on this primary differentiated material set up a further differentiation, and this series of actions and reactions continue to the end, the process being more or less modified by the reactions of one set of genes upon the others. That the genes are complex chemical compounds, possibly of the nature of enzymes, acting upon the protoplasm of the body seems a reasonable assumption from what we know of their mode of working.

It seems, however, certain that the cytoplasm of the egg plays some part in heredity and is not merely an inert mass, molded by the genes in the chromosomes. Apparently the general characteristics, e.g. whether an egg shall develop into a dog or a horse, are determined by the cytoplasm while the individual characteristics are controlled by the genes.

If genes are chemical compounds of the nature of enzymes it should be possible to modify their structure by chemical or other means and there is experimental evidence that this can be done. If the cases mentioned earlier, where external forces have permanently modified the race, are valid, the genes must have been modified. Mutations also (see ZOOLOGY) must owe their origin to changes in the composition of the genes.

This work in heredity has decidedly modified opinion on one point which had seemed so obvious as to be axiomatic. This was the principle which underlay all of Darwin's work on selection, that of the supposed efficiency of the selection of individual variations. Among the members of any generation are always found variations in the degree of development of any one character. Darwin supposed, and this has generally been believed until quite recently, that if extreme variates be isolated from the remainder and allowed to breed, some of their offspring would vary still more widely in this direction and if this process is continued almost any amount of variability could be obtained.

If this is true it would mean that the character of genes could be changed by the act of selection and the evidence indicates that it is probably not true.

In any species the range of variability is fixed, and selection of the greatest or the smallest variate from the mean of the species would not in any way affect the range of variability of the next generation. Where the selective process seems to be efficient it may mean either that the original group was not homogeneous and selection has isolated different races from one another, each having its own range of variability, or that there were genes modifying or interfering with the action of the genes under consideration and the selective process has removed these, thus allowing the original gene free expression. The gene is apparently not modified through selection.

As a result of his study of biometry, Galton decided that inheritance is blending, i.e. that the offspring of two parents unlike in any particular character would be, with respect to that character, intermediate between the parents. If this were true, it would mean that the genes from the two parents had modified one another. The Mendelian interpretation is that in such a case the apparent blending is due to the peculiar action of two or more genes. For example, a brown-chaffed and a white-chaffed wheat were crossed and F_1 was brown. F_2 , however, did not have brown and white in the proportions of three to one as might have been expected but there were fifteen brown to one white and the browns were not all of the same shade. This can be explained on the assumption that there are two genes for brown, B and B^1 , each capable of producing the color, but BB^1 gives a more intense shade than either B or B^1 alone. Worked out on the checker-board diagram such as has been given, this theoretical expectation agrees closely with actual observations and there is no evidence for a true blending due to modifications in the character of the original genes.

By offering precise information concerning the results to be expected from any given mating, Mendelism has been of service to practical plant and animal breeders, and these services will undoubtedly be extended with advancing information. In human heredity, because of the obvious impossibility of experimental matings and because of the small size of human families, accurate information is more difficult to obtain, but enough is known to offer to eugenics much valuable assistance in its efforts to improve human qualities. This is especially true in the cases of a number of diseases which are sex linked in inheritance and which, by applying the rules mentioned above, might easily be eliminated from the race. See EUGENICS.

Bibliography. The following books summarize the more important works in this field though several of them of course are the work of pioneers in this branch of biology: Darwin, *Animals and Plants under Domestication* (New York, 1876); Spencer, *Principles of Biology*; Galton, *Natural Inheritance* (New York, 1889); Bateson, *Mendel's Principles of Heredity*; Thomson, *Heredity*; Cunningham, *Hormones and Heredity*; Pearl, *Modes of Research in Genetics*; Castle, *Genetics and Eugenics*; East and Jones, *Inbreeding and Outbreeding*; Morgan, Sturtevant, Muller and Bridges, *The Mechanism of*

Mendelian Heredity; Weismann, *The Germ Plasm*.

HERELLE, F. d' (?) . A Canadian-French pathologist distinguished for a remarkable discovery of a principle or organism which attacks and destroys bacteria. Born in Canada, he removed to France while young, and having taken a degree in medicine he joined the research force of the Pasteur Institute at Paris and made his discovery of the so-called "bacteriophage." His labors in this field were summed up in a monograph originally published in French but issued in a more advanced form in English with the title *The Bacteriophage* (1922).

HERFORD, CHARLES HAROLD (1853-). An English scholar (see Vol. XI). His later publications include: *Is There a Poetic View of the World?* (1916); *Treatment of Love and Marriage, and Other Essays* (1921).

HERGESHEIMER, JOSEPH (1880-). An American author, born at Philadelphia, Pa. He studied painting for a time, but soon turned to literature, receiving his initial encouragement from George Horace Lorimer, editor of the *Saturday Evening Post*. His writings continued from time to time to appear in that periodical. His first novel, *The Lay Anthony*, which was not published until 1914, was at once acclaimed as a work of the first importance. There followed in rapid succession a series of notable books, including: *Mountain Blood* (1915); *The Three Black Pennys* (1917); *Jara Head* (1919); *Linda Condon* (1919); *Cytherea* (1921); *The Bright Shaul* (1922); and the collected short stories *Gold and Iron* (1918) and *The Happy End* (1919). Possessed of a luxurious style that is peculiarly effective for his subjects, with a feeling for exotic backgrounds that he has, nevertheless, been able to render subordinate to the essential work of character delineation, Mr. Hergesheimer, in the *Lay Anthony*, in *Linda Condon*, in the first parts of *The Three Black Pennys* and *Jara Head*, has written fiction little surpassed or even equaled in the period. Always intelligent and the man of the world, always sure of his powers, a little too ostentatious in his devotion to the details of the luxurious life, but saved by the brilliance with which he has been able to manipulate those details to build up a convincing word-picture, he has produced romances notable for character, atmosphere, and circumstances. It is interesting to note that he has been least successful with modern themes, that his *Cytherea* fails where his *Three Black Pennys* succeeds. But he is not concerned with problems so much as he is with life, and nothing gives him more pleasure or tests his powers better than the depiction of attempts at violent and perhaps maladroit readjustments. His young *Anthony*, the Chinese figures in *Jara Head*, and *The Bright Shaul* are cases in point.

HERMANN, GEORGE (pseudonym for GEORG HERMANN BORCHARDT (1871-). A German novelist. He made old Berlin the background of most of his stories, some of which were dramatized: *Spielkinder* (1897); *Die Zukunftsfrohen* (1898); *Aus dem letzten Hause* (1899); *Jettchen Gebert* (1906); *Henriette Jacoby* (1907); *Aus guter alter Zeit* (1913); *Heinrich Schön, Jr.* (1915); *Von gesicherten und ungesicherten Leben* (1915); *Einen Sommer lang* (1917). His plays include: *Jettchen Gebert*; *Henriette Jacoby*; and *Mein Nachbar Ameise*

(1920). He is also the author of two volumes of sketches *Randbemerkungen* and *Kleine Erlebnisse* (1920).

HERMANSSON, HALLDOR (1878-). An Icelandic philologist. He entered the university of Reykjavik in 1898 and three years later that of Copenhagen. In 1905, he was appointed curator of the Fiske Icelandic Collection at Cornell University Library and became connected with the university as instructor in Scandinavian languages, professor and lecturer. He is the author of *Bibliography of the Icelandic Sagas* (1908); *The Northmen in America* (1909); *Bibliography of the Sagas of the Kings of Norway* (1911); *The Ancient Laus of Norway and Iceland* (1911); *Bibliography of Mythic-Heroic Sagas* (1912); *Icelandic Authors of To-day* (1913); *Icelandic Books of the 16th Century* (1916); *The Periodical Literature of Iceland* (1918); *Modern Icelandic* (1919); *Bibliography of the Eddas* (1920); etc. He has compiled a *Catalogue of the Fiske Icelandic Collection* (1914) and *Runic Literature* (1918) and has edited *The Story of Gríseldis in Icelandic* (1914) and *An Icelandic Satire: Lof Lyginn* (1915).

HERMANT, ABEL (1862-). A French man of letters, born in Paris, and educated at the Lycées Bonaparte and Condorcet. He devoted himself to journalism and to literature, writing critical essays, novels, and theatrical comedies. In all his works he displayed a keen sense for satire and social caricature. One of his novels, *La Carrière*, dealt ironically with the diplomatic "career," and it is this that is supposed to have prevented Hermant's election to the official French Academy. He did, however, receive the badge of Commander of the Legion of Honor. His works include: *Les Mépris* (1883); *Monsieur Rabousson* (1884); *La Mission de Cruchod* (1885); *Le Cavalier Miserey* (1887); *Nathalie Madoré* (1888); *La Surintendant: Amour de Tête; Serge; Ermine; Le Frisson de Paris; Coeurs à Part, Coeurs Privilegiés; Les Confidences d'une Aieulle* (1893); *La Carrière* (1894); *Eddy et Paddy* (1894); *Le Disciple Aimé* (1895); *Le Sceptre; La Meute; Les Transatlantiques* (1897); *Le Char de l'Etat* (1899); *Le Faubourg; L'Empreinte; Sylvie ou la Curieuse d'Amour; Souvenirs du Vicomte de Courpière* (1901); *La Confession d'un Homme d'Aujourd'hui* (1904); *L'Esbrouffe* (1904); *M. de Courpière Marié* (1905); *La Belle Madame Héber* (1905); *Les Grands Bourgeois; Chaine Anglaise; L'autre Aventure du Joyeux Garçon; Chronique Française; Le Cadet de Coutras; Les Renards; Le Second Testament; Trains de Luxe; Affranchis; Le Caranversail; L'Aube Ardente; La Vie à Paris; Le Rival Inconnu; La Journée Brève* (1920); *Phili; La Petite Femme* (1921); *Entretiens sur la Grammaire Française* (1923).

HERRE, PAUL (1876-). A German historian, who in 1920 became director of the political-historical archives at Potsdam. He was born at Magdeburg, studied at the universities of Berlin, Jena and Leipzig, and in pursuit of a commercial enterprise traveled in Germany, Austria, Italy, and Spain. He was lecturer at the University of Leipzig (1906-20). He is the author of: *Preussens Befreiungs- und Versuchungskampf* (1914); *Spanien und der Weltkrieg* (1915); *Weltpolitik, Weltkatastrophe* (1916); *Geschichtliche Schlaglichter auf den Weltkrieg* (1916); *Aufruf an die Neutralen zur*

Geduld (1918); *Bismarcks Staatskunst* (1916); *Volkergemeinschaftsidee und Internationale Politik* (1920).

HERRICK, MYRON T. (1854-). An American diplomat (see Vol. XI). He was in charge of the American Embassy in Paris at the outbreak of the War and did efficient service in the protection and assistance of Americans in Europe. He was reappointed ambassador by President Harding in April, 1921. For these services in France, he received the Grand Cross of the Legion of Honor. After the war he was chairman of the American Commission for Devastated France.

HERRICK, ROBERT (1868-). An American writer and educator (see Vol. XI). His later books include *His Great Adventure* (1913), *Clark's Field* (1914), *The World Decision* (1916), *The Conscript Mother* (1916), *Homely Lilla* (1923), and *Waste* (1924). He was a member of the National Institute of Arts and Letters.

HERRIN, ILL. See STRIKES

HERRIN MASSACRE. See COAL.

HERRIOT, EDOUARD (1872-). A French politician and man of letters. He was educated at the Ecole Normale Supérieure, and at the conclusion of his studies became a professor of rhetoric and literature at the University of Lyons. He entered politics and was successively counsellor-general of the Rhone, Mayor of Lyons, Senator, and minister in a radical government. Before the War he became one of the leaders of the *Parti Radical Socialiste*. This party was temporarily disorganized by the War and by the trial of Caillaux, but it came back strongly in the 1924 elections with Herriot as its leader. After the Armistice, Herriot opposed the reparation policies of the nationalist groups in France and favored a rapprochement with Germany and Russia. He made a visit to Russia in 1922 and described what he saw in the land of the Soviets in a book entitled *La Russie Nouvelle*. In June, 1924, he became premier of France, with a government drawn from the parties of the left bloc. As a man of letters, Herriot was best known by a work on Philo Judæus and the Jewish-Alexandrian school of philosophy which was crowned by the Academy of Moral and Political Science in 1897. His other works include: *Un Ouvrage Inédit de Mme de Staël*; *Fragments d'Ecrits Politiques* (1904); *Précis d'Histoire des Lettres Françaises* (1905); *Agir* (1915-16); *Créer* (1919).

HERRMANN, CONRAD EDMUND GUSTAV (1871-). A German writer. He was born at Leipzig and attended the university. He engaged in an export business and traveled in America (1893-95). During the War he was instructor of oratory at the Volks-Akademie in Leipzig. He is the author of the plays: *Savonarola* (1886); *Sensation* (1906); *Der Triumph des Mannes* (1906); *Der grosse Baal* (1907). Other works include: *Vineta*, a volume of verse (1908); *Und doch* (1915); *Salusha*, a Russian story (1919); *Lebensfahrt* (1919); *Wilhelm Busch an der Himmelstür* (1920); *Gesichte und Grimassen* (1920); *Der lachende Olymp* (1921); *Maulwurfe* (1921).

HERSHEY, AMOS SHATTLE (1867-). An American educator (see Vol. XI). Among his later writings were *Modern Japan*, with Frank M. Anderson (1919), and *Handbook for the Diplomatic Relations of Europe, Asia and*

Africa, 1870-1914 (1918). He was a member of the staff of the American Commission to Negotiate Peace, 1918-19. He was a frequent contributor to magazines on political science and law.

HERSHEY INDUSTRIAL SCHOOL. See EDUCATION IN THE UNITED STATES.

HERTER, ALBERT (1871-). An American painter and craftsman (see Vol. XI). Among his later mural works were a series for the Supreme Court room of the Wisconsin Capitol, and an allegorical pageant in the St. Francis Hotel, San Francisco. At his Herter looms he designed and produced artistic tapestries.

HERTLING, GEORG, BARON VON (1843-1919). A German administrator and Catholic philosopher (see Vol. XI). On Nov. 1, 1917, he was appointed Chancellor by the Kaiser, and by his skill brought some measure of stability into the affairs of the German government. His task was made easier by the fact that at that time Russia collapsed and the invasion of Italy was succeeding. Later, when Bulgaria capitulated at the end of September, he was driven from office. In his last speech he declared that Germany's discontent was due entirely to military reverses, but said that the German people would stand firm and not beg for mercy; that the iron wall on the western front would not be broken; that the U-boat war was slowly tending to success, and gradually would restrict the reinforcements from the United States; and that the hour would come when the enemy would see reason and be ready to make an end of war. See GERMANY, *History*.

HERTY, CHARLES HOLMES (1867-). An American chemist, born at Milledgeville, Ga. He was graduated at the University of Georgia in 1886, and received his Ph.D. at Johns Hopkins in 1900, after which he took courses at Berlin and Zurich. In 1890-1901, he was assistant chemist of the Georgia Experiment Station and then taught at his alma mater, attaining the rank of adjunct professor of chemistry in 1894. From 1901 to 1904, he was with the Bureau of Forestry in the United States Department of Agriculture, and then for a year with the Chattanooga Pottery Company. In 1905, he was called to the chair of chemistry at the University of North Carolina, where he remained until 1916, when he became the editor of the *Journal of Industrial and Engineering Chemistry*. His principal researches have been in organic chemistry and include the determination of the constitution of inorganic compounds by physico methods; also he invented a new method of turpentine orcharding and a rapid method for the determination of oil in cottonseed products.

HERTZ, ALFRED (1872-). A distinguished German conductor (see Vol. XI). In 1915, he resigned his position at the Metropolitan Opera House and accepted the conductorship of the San Francisco Symphony Orchestra, which under him soon developed into one of the great orchestras of the country. He was largely instrumental in winning recognition for the native composer. While at the Metropolitan he conducted all the operas by American composers produced there.

HERTZOG, J. M. B. (?-). A South African statesman and soldier (see Vol. XI). At the outbreak of the South African rebellion in 1914, although he did not take an active

part in opposition to the British government, he declined also to oppose the rebellion. In the years following the War, he headed the opposition to the government of General Smuts and continued in aggressive opposition to the governmental policies of that statesman. On defeat of the Smuts ministry, early in 1924, he became Prime Minister.

HERTZSPRUNG, EJNAR (1873-). A Danish astronomer. He was born in Copenhagen, studied at Leipzig, and was connected with the observatory of Potsdam, until called to Leyden, Holland, where he was first director of the observatory, and since 1920, professor at the university. He has written much on astrophysics for scientific periodicals.
